From the families of these tacksmen have sprung most of those of Lewis birth or descent who achieved fame before the twentieth century. Of the MacAulays, we saw Zacharias was Chamberlain during and after the 'Fifteen. Thomas Babington Macaulay came of the same line, as

did another Zacharias, closer than Thomas to the Lewis tree, who worked nobly with Wilberforce for the emancipation of the slaves.[1] Still another connection was a Canadian emigrant, grandfather of the late T. B. Macaulay, LL.D. Alexander Mackenzie, the explorer of the Mackenzie River, was a descendant of Lewis tacksmen. MacIvers and Morisons also distinguished themselves. But the sons and daughters of crofters had to await the provision of education in English before they could rise in trade, learning or war; hence few Lewismen of the greatest Lewis name, MacLeod, achieved eminence until the twentieth century.

As for the peasantry, the interposition of a new or enlarged class of tenantry between themselves and the superior must have meant that they had to labour on the tacksman's home farm, and no doubt pay more in produce or cash. Hence the Gaelic saying that if the position of the small (joint) tenants was bad, that of the subtenants was worse, "the Evil One itself". Following the long fight with the Fife Adventurers, hardship may have been greatest where mainland tacksmen were placed above the joint tenants; but even under MacAulays and MacIvers rents may have been raised and some of the joint freedom lost which was still enjoyed in Ness. Whatever adjustments had been made in an earlier period had to be re-made with the beginning of Seaforth's new order.

In the following generations, contradictory accounts of lairds, factors and tacksmen are given by contemporary observers. Certain of these insisted that, given the poverty of the lands as a whole, the chiefs and landlords, factors and tacksmen, were the saviours of their people. Yet even among those who supported authority in general, there was

[1] Charles Booth, *Zachary Macaulay*, 1934.

seldom agreement as to which of these three types brought the greater good or wrought the lesser evil. As elsewhere, tacksmen declined by the end of the eighteenth century. Buchanan wrote in 1793, "The greatest tacksman in Lewis is the Laird's ground officer"; but he added that the Island was for the most part inhabited by tenants holding directly from Seaforth, who "easily perceived the folly, as well as the inhumanity, of lending out the people on his island to imperious tacksmen, for the purpose of raising fortune to themselves on the ruins of the unfortunate subtenants". At a later date a former Chamberlain of the Lewis estate, John Munro Mackenzie of Calgarry, held otherwise. To the Napier Crofters' Commission in 1883, he said: "Till the beginning of this century the greater part of the Lewis was in the hands of tacksmen, or middlemen, who got in some cases from their subtenants in money, produce, and labour, what nearly paid their rents". Their names were those of the seventeenth century. Early in the century, "when Mr. Stewart-Mackenzie married the Hon. Lady Hood, daughter of Lord Seaforth, and took the management of the estate into his own hands, he did away with the middlemen, and let the land direct to the crofters. This, no doubt, was a step in the right direction, but it had its disadvantages, as the example of a good middleman, who looked after his people, and who was industrious in farming . . . and stock-breeding, was beneficial to the people, though in some cases they may have been petty tyrants." He might no doubt have added that they could, if need be, stand between a bad factor and the crofters.

When they lost their tacks, some of these 'middlemen' turned to the growing fishing industry and helped to supply capital and enterprise as curers; their successors were active through the nineteenth century and I spoke with

his bonnet in his hand and bowing low and reverently, he declares on honour in presence of earth and heaven, in presence of God and men—*Am fianuis uir agus adhair, am fianuis Dia agus daoine*—that he shall be faithful to his trust. This simple declaration of office is extremely impressive, though now, alas, becoming obsolete from the fears of the shallow thoughtless and the scoffs of the severely wise. The duties of the constables were to divide a new peat-moss into banks for which lots are cast, to see that every crofter does his share of free labour in road building and repair, to engage herds and the like." (*Napier Crofters' Commission*, 1884.)

Naturally such duties called not only for tact, firmness and authority, temporal and spiritual, on the part of the constable, but for strong backing by the crofters, as a body, of the man they had freely elected. But hence too, the advantage to a covetous landlord of superseding free election by appointing his own nominee. Martin found that this had been done in St. Kilda shortly before his visit (about 1695) and the people complained bitterly, as well they might. We shall see that the same suppression of liberty was resented in Lewis less than a century ago. As a mere estate employee, moreover, the constable's position between the landlord's factor (or ground officer) and his fellow-crofters, was always difficult; and it might be cruelly hard, as when he was forced to help in destroying a neighbour's house at an eviction. Neighbourly union in a township was damaged by this duality of function, when he who should have been their own impartial executive was in the landlord's pay. When affairs got too bad in a Lewis township the people would appoint their own constable in addition to the landlord's; even so, rivalry and dual functions weakened the community. Such weakness

in the country, and foreseeing that the only sure way to avoid irritation, friction and law-breaking was to grant the farms and have done with it, the Secretary of State for Scotland and the Board felt that they could not withdraw the Government's promise of land. The Secretary for Scotland, Mr. Munro (later Lord Alness), spoke with knowledge as a Highlander. A general promise of small-holdings had been made to all Scotsmen in the Services, and could not easily be set aside at the wish of one man, then approaching the age of seventy, however well-intentioned, wealthy and in earnest. Yet Leverhulme declared that while he would relinquish farms on the west side of Lewis, his schemes could not go on unless he retained the farms on Broad Bay to supply fresh milk for Stornoway. If the farms were divided, he said, he must close the whole scheme forthwith.

Of his earnestness Leverhulme left no doubt. He not only planned but set up a retail agency, Mac Fisheries, and he purchased drifters and trawlers, the Mac Line, to fish far afield and bring the catch to Stornoway, there to be transhipped by his own carrying service. He set about building model dwellings in Stornoway itself, each with its quarter-acre allotment. 'Work and Wages' from capitalised fisheries were his offer, in further token of which, road-making and other wage-providing work was begun. Until 1920 the farms remained undivided. The farmers, for their part, could only wait for the expiry of their leases, or for the transactions by which their leases would be foreclosed and compensation awarded. Prices of stock were high at the time, and the valuation would correspond to these. Hence tenants felt they could afford to wait. Meantime crofters' stock wandered over their farms—whether because of the wilfulness of the stock or

of the owners—but farmers knew it was futile to protest, and they suffered with a wry smile and a shrug of the shoulders. After all, most of the farmers had stayed at home and their affairs had prospered, in war-time; whereas all but the older crofters had had years of seafaring or fighting, and the nation's debt to them had not yet been forgotten. The farmers kept quiet and waited.

Meantime, Leverhulme made public war upon the Government. Speaking in Edinburgh in November 1919, he declared that "Reports, thick as leaves in Vallombrosa, have been the dominating feature of Government policy in the Highlands and Isles . . . but the invariable rule seems to have been, whenever expenditure of public money was recommended, for the Government either to ignore such reports or to cut down expenditure so penuriously as only to result in waste . . . by not spending to the full amount . . . Lewis and Harris have too long been the Cinderella in the Government pantomime."[1] The crofters, reading this in the daily papers, and again in the weekly *Stornoway Gazette* a day or two later, chuckled with glee, rolling the phrases on their tongues. They might not all have been able to explain the strange words, like Vallombrosa or Cinderella, though they sounded fine; but all had heard of pantomimes, and some might even have seen one, without saying too much about it to the minister. About 'penurious expenditure' they could have no doubt. Yes, a fine speech, they felt! Yet in spite of the sting of truth contained in such orations, these did not make it easier for Government to co-operate with the orator, to prevent raiding or to deal with it should it begin.

Raiding did begin in the spring of 1920. Applicants

(B) SLOW CHANGE: 1925-39

1. *The Land, the Sea, and the Loom*

423 When Leverhulme parted company with the people of
632 Lews his gesture of farewell was one of generosity: the
431 offer of Lewis to its people. The Stornoway Trust was
[623] formed, and this accepted the gift of the adjacent crofting townships of the Parish, and of the Castle and its beautiful Park or 'policies'. In crofting townships, however, the people declined the offered gift of land, finding that they could not afford the augmentation of rates entailed by acceptance. So the remainder of the estate was offered for sale in several lots, which were bought by individuals
423 and have proved safe investments. The letting of sporting
632 rights adds a further, albeit a variable, return of income to that of the rents received. It is indeed anomalous that a
• 427 crofting estate, such as a Lewis parish, can yield a good
431 return to a purchaser, yet that the crofter-occupiers them-
829 selves would lose by receiving it as a gift.[1] Much-needed improvements in housing would also be discouraged, for fear of increase in their rates. It is true that if (under existing laws of assessment) all the farmers and crofters, cottars and squatters of a county were to become owners at the same moment, the total increase in assessments would either be repaid in greater services or met by lowered rates

[1] The reasons (as indicated in Chapter IX (E)) are briefly that a crofter (or 'small landholder'), as occupier of an agricultural holding, can only be assessed at three-eighths of the occupier's half of the assessment on his Fair Rent, *i.e.* at less than a quarter of the whole rental. Although he may have built a good house and other buildings he is not assessed at their full value; neither is his landlord. Were he to become owner he would then be liable to assessment both as occupier and as owner, on the full annual value of land and of buildings too; with deduction of five-eighths on the agricultural value as occupier only.

[see pp. 320-323 ·· analysis]

423 —or by a compromise between. But as it is, if one crofter,
431 or a small group of crofters like those of a township or
• 427 parish of Lewis, were to become owner-occupiers (even by gift), they would be penalised as compared to others.
632 Hence the Lewismen preferred to go on paying rent as
829 statutory crofting tenants. Leverhulme sold the land and received the price; the new owners paid for it and received an investment; and the only 'loser' on this curious transaction was the Local Authority, the County, which failed to make more in rates!

[623] Further reasons why the great majority of crofters declined Leverhulme's offer have been given by the Lewis Association's Economic Committee (1944):

(a) As individual proprietors, they would lose the advantages of the jurisdiction of the Scottish Land Court in dealing with their disputes, and any litigation would take a more costly form.

(b) They would be debarred from obtaining loans from the Department of Agriculture for Scotland for the improvement of their holdings [illegible]ouses; as the Department would no longer have the "Corne[illegible] Stone" of a landlord to fall back upon in the event of renunciation.

(c) The crofters were afraid that as individual proprietors they would forfeit their share of the Common Grazing rights.

(d) Should they wish to quit their holdings they would be compelled to find a buyer in the open market, instead of renouncing to their landlords and getting valuation.

(e) There is a feeling among Lewis crofters that they prefer to have a landlord before whom they can lay their difficulties and disputes, and who will attend to their wants; an authority that relieves them of responsibility.

[181] As the historical evidence has shown, a lack of responsi-
[624] bility has been greatly due to the undermining and then the abolition of the authority of the township's own elected
[175] Constable.

362 of new steadings. The average amount of loans (totalling
652 £166,000) was under £150; repayment has been satisfactory, and the arrangements made by the Department of Agriculture won general praise among the people. Yet 1200 houses were very far from replacing all the 'black houses', and many more are needed.

433 In terms of cash profit, ten crofters today run their crofts less remuneratively than the farmer they dispos-
• 427 sessed; even together they may show little more total
241 production than the farmer. Nevertheless, these ten crofts each allow a part, at least, of the basis for a country home.
[423] Hence the weight of public opinion supported, nay, insisted on 'giving back' the land to the descendants of those who
654 had worked it sixty or a hundred years before. The State
423 bought the farm stock at a high valuation, and till lately without adequate reform of crofting use and wont. The farms having now been divided, a great emotional issue, which had smouldered for half a century, has been brought to an end. Although the practical results are small, the crofters feel that justice has been done, and that fact may
311 be a great gain. Now that there is no more green reclaimed land to be had, the reclamation of the peat moor, or the grey 'skinned' boulder clay has to be faced.

By financing the renewal of Leverhulme's brief attempt to reclaim deep peat on Arnish Moor, south of Stornoway, the Canadian, T. B. Macaulay, made a resolute attempt to
[241] solve the island's main agricultural problem. Good crops were grown, potatoes and silage produced, and a dairy farm established. But the difficulties called for continuity of effort and research. From the practical point of view of 'demonstration' it had been a mistake to tackle deep and almost level peat, black in colour and viscous in consistency.
[407] There was not the light machinery required for cultivation.

The Trustees of the Stornoway Trust have not found it easy to meet the cost of keeping up the valuable property of the Castle and Park, nor to carry the burden of its rates, no adequate income being available for the purpose. Today, however, Leverhulme's gift is being put to good use as a Technical College, opened in September 1952.

Division of the available farms, after providing about 200 small crofts (of ten acres or so), still left the problem of finding legal homes on legal tenure for the remaining cottars and squatters.[1] The Department of Agriculture arranged to feu plots of 'skinned land' on the outrun of certain townships, including one in the extreme north and others in Lochs. About 200 of these little holdings with potato ground were provided. On the holders' behalf the Department feued land from the owner, after obtaining the consent of the Common Grazings Committee of the township and permission from the Land Court for 'resumption', *i.e.* for enclosure of a portion of the common. The legal and administrative procedure involved may seem disproportionate to the economic value of the holdings. Yet difficulties of law and custom had been allowed to go from bad to worse during the past eighty years; and these difficulties were overcome.

To encourage better housing in the crofting counties, loans are made to 'crofters and fishermen feuars' personally. Local stone, or latterly concrete, is used, and much of the building is done by the 'man of the house' himself, and his friends. From 1920 to 1940, nearly 1200 loans were made in Lewis and Harris for the erection (or improvement) of houses, and in a few cases for the erection

[1] Estimated at 1200 to 1500 shortly before, the open question was whether subdivision during the previous eighty years was to be recognised and accepted.

(1) Crofters were moved to Kirkibost from Bosta (425 acres), which w given as an enlargement to Tobson crofters.
(2) Partly off Timsgarry.
(3) Partly off Carnish and Ardroil.

142 The circular, corbelled stone "beehive" huts, some still in good repair, are of uncertain date. The best preserved are on the Moregail Deer Forest, in remote situations which make it almost certain that they were only occupied seasonally; those on the Garynahine common pasture are associated with assymmetrically ridged, curving, lazybeds. This, however, need not imply permanent occupation of the site, nor does it solve the problem of age; such lazy-beds are certainly old, possibly pre-potato (c. 1790 here) - but the huts do not decay with age and may be very much older.

175 [24] [226] [251] [441] [614] Early in the eighteenth century the present area of the parish of Uig was held from the Seaforth clan chief by 26 tacksmen, whose names are recorded in the judicial-rental of 1718, (Fig.4). They, presumably, had sub-tenants but of these there is no record. Elsewhere in Lewis the same rental records many small tenants holding direct off the chief but in Uig, apparently, the tacksman and sub-tenant system remained intact. Although we cannot be certain of their precise extent, the distribution of the tacks coincides fairly well with that of the better agricultural ground (Fig.2).* Five of them cluster round Uig bay, four were in the Valtos-Reef area, and three around the strait of Little Bernera. All these districts have machair; together they accounted for three quarters of the meal and more than half the sheep and money rents. What is more, these rents represented 27% of the total rental of Lewis, whereas by 1887 Uig yielded only 17% of the rental and by 1901 the proportion was reduced to 14%. The relative decline of Uig is largely due to the growth of Stornoway; this shift in the centre of gravity of Lewis has tended to exaggerate the remoteness and isolation of Uig in the present century.

[241] [178] [369]

161 175 [24] [226] [251] [441] [614] 200 By the end of the eighteenth century the tacksmen seem to have disappeared; at any rate they are not mentioned in the remarkably detailed account of the parish given in the Old Statistical Account, 1792. Meanwhile the small tenants had multiplied: whereas in 1755 the old parish * had supported 1,312 persons, in 1792 the minister recorded 1,898 . At this time there was neither plough nor cart in the parish. The minister was cultivating potatoes and his family were eating them

175 The new proprietor was no better placed than Seaforth to change the fundamental
427 causes of recurrent poverty and distress. But at least he had funds to ameliorate his
233 tenants' lot and to allow experiments in land reclamation and industrial development.
314 Existing sheep farms were extended and others formed. Land reclamation went forward
339 hand in hand with industrial experiments such as distillation of paraffin from peat and
191 brick and tile-making. A programme of road building was begun (the first roads beyond
224 Stornoway were begun in 1791, but there were only 45 miles of road by 1836). In Uig the
results were very obvious. Further clearances took place particularly from Timsgarry,
Carnish (21 tenants), Reef (22 tenants), Garynahine, Dun Carloway. The small tenants of
Valtos and Kneep were only saved from eviction by the intervention of the Fisheries Board,
162 for they were important places for white fishing. By the 1850's, although the population
of Uig was more than double that in 1755, and 60% greater than in 1800, it was crowded
160 into little more than half the area. Emigration enforced by clearances reduced the popu-
lation of Bernera and South Uig by nearly 500 between 1851 and 1861.

175 No other part of Lewis saw so many farms; nowhere else did the small tenants suffer
427 so much from eviction. That was not all. Those who remained undisturbed were de-
311 prived of some of their traditional grazings and access to the rest was sometimes
233 restricted. Moreover they had to make room for many of the evicted families in their
own townships, thereby further increasing the problem of congestion caused by the rapid
161 natural increase of population. Thus, for example, about 1825 there had been 22 families
162 in Valtos and Kneep. By about 1880 there were almost 100. But, during the same
period these townships were deprived of their island grazings - Pabay, Vacsay, Floday
and Wiay - formerly used for wintering cattle - and of part of their hill grazings (the
traditional shielings). Use of the hill-grazings was restricted, too. Thus, for example,
only one day was allowed to pull heather for ropes; if men were away fishing or for other
reasons, could not attend on that day, they risked punishment by going on any other. Such
stories could be multiplied many times.

103 In the Bernera district, by the 1850's, only Tobson, Bosta and Breaclete (on the
island) and Earshader and Crulivig (on the mainland) were left for the crofter families.
Moreover their traditional summer grazings, which lay south east of the Deer Forest
which was formed out of the Scaliscro sheep farm about 1850. Apparently their use of
the old shielings was tolerated until 1878, after which date they were directed to the area
north of the present road and which they have continued to use until the present day. Thus
the shieling huts shown in fig.5 all post-date 1878; the area in which they lie may have
been part of the West Earshader tacksman's holding. The date of discontinuance of that
tack is not known but the house, now empty, was for long occupied by squatters and the
old lazy beds around it still form part of a large squatter holding.

It is noteworthy that almost all the clearances were in the Bernera and South Uig
districts and this is reflected in population changes between 1841 and 1851, shown in
table 4.

The cleared areas included extensive hill and mountain grazings and some of the best
wintering ground, including all the machairs except Valtos and Kneep. The East Loch
Roag and Carloway districts were less attractive to the new farmers; as is so commonly
the case in Lewis, their rough grazings lay on gently sloping low plateaux and were con-
sequently ill-drained and of poor quality. About 1852 Dun Carloway was let as a tack but
was never successfully farmed and was soon returned to crofter-occupation; it may never
have been wholly cleared of crofters. Garynahine, at the southern end of East Loch Roag,
next to Linshader, was also turned into a farm about 1852. Here the hill grazing was more
extensive and, though seriously reduced by a crofter settlement scheme c. 1936, it remains

195 a well cultivated small farm, a striking example of what can be done with this unpromising
427 terrain. It is probably true that one of the objects of forming farms was to introduce
311 improved methods and so set an example to the small tenants. The contrast, today, between Garynahine Farm and the nearby crofts, suggests that more than example is required.

TABLE 4

161 POPULATION CHANGES 1841-1851
162
175

District	1841	1851	Change	(%)
Carloway	554	659	+105	(+19)
E. L. Roag	581	717	+136	(+23)
Bernera	670	676	+6(1)	(+1)
L. L. Roag	217	259	+42	(+19)
Valtos etc.	711	484	-227(2)	(-32)
Uig Bay	520	426	-94(3)	(-18)
South	384	348	-36	(-9)

Notes: (1) Visamore - 46 (-100%). Kirkibost, Linshader, etc. had already been cleared.
(2) Reef -180 (-96%).
(3) Carnish - 60 (-36%) - but completely cleared before 1861.
(Township figures are not available before 1841).

The birth of the crofting landscape.

195 A further mid-nineteenth century attempt to improve the productivity of the small-
427 tenants' holdings was the lotting of runrig lands to form individual crofts. In a report to
311 Seaforth c.1800, the Rev. Headwick had recommended the abolition of runrig* and some
638 lotting of crofts took place about 1811** about which time runrig was being abolished in North and South Uist - but many townships in Uig, as elsewhere in Lewis, escaped this lotting. In Bernera, Kirkibost was probably lotted at this time and the crofts fenced; in 1852, despite clearance, the first Ordnance surveyors were able to record the old fences (which were used as the croft divisions when Kirkibost was re-settled in 1878). The now much divided crofts of Kneep (see also fig.22) are probably of the same date. Reef appears, also, to have been lotted early, for the remnants of fences recorded by the
[63] Ordnance Surveyors in 1850-1852, (Reef was cleared in 1850), show crofts of the same general form as those of Kirkibost, and quite unlike those of the 1850 lotting. Consequently, in many townships until this date, the houses remained huddled together in tight little groups, often inter-communicating one with another. The groups, or clachans, were usually set in the midst of the arable land. The runrig system had certain disadvantages, but, as a basic agricultural structure for small holders, it had two considerable advantages which may be relevant to modern conditions. Firstly, it was flexible: within it the individual's holdings varied in size and rent and it was possible, at the periodic re-allocation, to adjust the size according to family needs. An elderly person did not need to be burdened with a holding larger than he required, or was able, to cultivate; a young man with a

[113] ** Report .... on the Condition of the Cottar Population of the Lews. (C.5265), 1888, p.37

* The essence of runrig was that any individual's arable land was in many pieces, scattered promiscuously amongst those of his neighbours. Periodic re-allocation of pieces was usual, but the period varied and in some cases was infrequent.

Figure 7.

Figures 6 and 7

THE LOTTING OF BREASCLETE

Figure 6 shows the irregular clusters of old houses and patches of arable land (hatched) within the infield dyke. On the right the first of the new houses, standing in a row each on its own 'lot' (or 'croft'), are shown.

Figure 7, from the contemporary Factor's notebook, shows the new crofts as lotted in 1890. Note that these were not fenced.

195 growing family could increase the size of his holding. Secondly, in the absence of fences
427 a certain discipline of agricultural management had to be maintained; moreover the
311 proprietor, through the factor, grounds officers and township constables, saw to it that
632 it was. This "good husbandry", albeit at a rather low level, was maintained in the interests of tenants and land-owner alike. After the arable land was lotted permanently to individuals, there was less flixibility and less need for communal management. But the absence of fences between the new lots, or crofts, meant that they were still common land during the winter months. In some cases the proprietors paid the tenants to erect fences round the newly lotted inbye land of the whole township but, even when a ring fence existed, stock was allowed to graze indiscriminately within it from November until April.

It is fortunate that the first Ordnance surveyors were at work in Lewis just as the lotting was coming into effect. The new lots were not divided by fences, therefore they were not marked by the surveyors, but in several townships they arrived in time to plot the clachans and in some - Breasclete, for example (fig. 6) - the first edition six-inch maps show some of the new houses, neatly spaced out on the new lots. The arrangement of the latter is recorded in the Factor's sketch books, of which fig. 7 is an example.

175 Thus whilst we have little evidence of the appearance of the former rural landscape,
632 we have an excellent record of the birth of the new. The characteristic units of the new
178 lotting were townships divided into long narrow strips, arranged parallel and fan-wise more or less in the direction of steepest slope. Such an arrangement was simple to lay out; it tended to give everyone a fair share of the land of each kind - ill-drained and well-drained, high and low. And, if a road or track passed through the township it was usually possible to give each lot or croft direct access to it without the necessity for side-roads.
[367] Consequently the houses, when re-built, were usually put on the crofts. A dispersed pattern of settlement replaced the little huddles of the clachans. The extent to which it was dispersed depended on the width of the lots; the greater the number of tenants to be accommodated in a given area, the narrower were the lots. In extreme cases they might be as little as 20-30 yards in width and then the houses, aligned along the road or access track might form a virtually continuous terrace or street.

CHAPTER THREE

THE CROFTING STRUCTURE

429 In the parish of Uig about 90% of the families are crofters. That is to say, they owe their presence in Uig to their hereditary tenancy of a small-holding of croft status. To
[428] these holdings they have a deep attachment; many of them have been inherited through several generations. Others were obtained more recently during the process of re-settlement of farm land which followed the Napier Commission report and 1886 Act. Many older crofters regard the resettled townships as the fruits of a hard-won victory. Nevertheless, we have seen, very few of the holdings are in fact more than 110 years
[147] old. And, whilst some families can certainly trace their ancestors in the district for several centuries, there has always been a good deal of movement between townships. Thus the claim that they occupy holdings which were carved out of the barren moor by the toil and sweat of their ancestors is, in most cases, metaphor rather than strict truth.

● 429 Nevertheless, the attachment to the holdings is very real and must be given careful c
511 sideration when assessing their present utilisation and potential value. It is particul
significant because it leads to large numbers of tenants retaining holdings which are
[144] too small to yield a living. Inevitably they seek other sources of income either at h
(as by weaving or casual road labour) or away (as in the Merchant Navy, armed force
police or other skilled or unskilled work). As a consequence the croft is neglected a
[28] its potential resources, small as they are, are not realised. The decline in cattle
numbers since the late nineteenth century gives some indication of the scale of this lo
productivity over the parish as a whole. This is the crofter's own loss. Individuall
one can appreciate the problem - "four cows will not give me a living - better to get
[715] work on the hydro-scheme and sell the cows". And when one hydro-scheme finishes
another will take its place, or there will be casual road work or other labour and, bet
times, the unemployment benefit which the self-employed crofter does not get.

Certainly the land is of poor quality, the climate in some respects severe, and th
cost of transport, from Uig even to Stornoway let alone to the mainland, a perpetual p
[421] lem. But the root of the problem is the small size of most of the crofter-holdings, o
[81] the one hand, and, on the other, the importance which most crofters attach to the pos
sion of a holding, no matter how small and how neglected it may be. How has this co
to be?

TABLE 5

161 The multiplication of crofter-tenants, and their increasing rents, 1850-1890.

Congestion and Sub-division.

The crofting population of Uig started the second half of the nineteenth century with far less land than had been occupied by their forebears fifty years before, and, although famine, clearance and emigration had slightly reduced the population between 1841 and 1861, (from 3,828 to 3,630) thereafter it again increased, reaching about 4,600 in 1891. Rising agricultural prices after 1850 favoured farmers and crofters alike but, whilst the farmers prospered the crofters merely multiplied, thus in effect reducing the land available to each family. In 14 townships recorded in the 1850 sketch book the 273 holdings at that date had become 402 by about 1890, to which should be added a considerable number of cottars and squattars, many of them keeping stock and some sharing the rent of the crofts on which they had built their cottages. Detailed comparison of the rentals for the two dates shows that the increase had come about in two ways: firstly, it appears that, from time to time, where a new rent ledger was being made up, the factor would record separately cottars who actually shared the rent of the croft and, secondly, he would recognise and enter some of the squatters who had obtained rent-free (and illegal) holdings by enclosing and reclaiming from the common. The latter were added to the souming of the townships according to the rent put upon them. Table 5 (page 16), illustrates the process. The recognition of squatters, usually at £1-£2 per annum, led to the small increases in total rental. For the rest, the increasing numbers were caused by subdivision. Only in a few cases does the proprietor seem to have actively encouraged land reclamation by crofters. On April 17, 1850, four of the families which had been cleared out of Reef were allowed to settle on the Callanish common near the Breasclete boundary (hence the settlement became known as 'Breasclete Park'. Their rent was fixed at 15/- per acre for five years, thereafter increasing 1/- per annum until it reached 29/- per acre; they shared, according to their rent, in the Callanish common pasture. But forty years later one of these crofts had been divided into three, another into two, and two new ones had been carved out of the common; the total rental had risen to £13:19/-. Again, when Breanish was lotted in the spring of 1850, ten new lots were marked out and the rental is annotated "there are ten young men starting ... these lots as soon as the season commences". This appears to have been too optimistic; few, if any, of the new lots were ever broken in.

The farms, by contrast, prospered and the proprietor was able to share that prosperity by increasing rents as shown in the table:

TABLE 6

Farm:	Rental in the period: 1840's	1850's	1860's	1870's
Mealasta	£90	£105	£105	£130
Ardroil	£100	£105	£187	£255
Carnish	(£75: crofters)	£55		
Timegarry	£78	£84	£88	£108
Linnshader	£250	£297	£400	£425

It is worth noting that the rental charged for the newly cleared farm of Carnish was £55 - being £20 less than had been paid by the crofters. Thus it cannot be said that the latter were evicted purely in order to obtain more rent. The proprietor must have been taking a long term view, looking for land improvement rather than immediate gain. By the 1870's the farm rentals had increased by 55%, those of the crofting townships by only 15%. And the latter often remained unpaid.

Thus, whilst the farmers prospered, the tenants became crowded in their townships which were correspondingly less and less able to support their increasing numbers. The crofts became so reduced that in an average year the produce of the land might keep a crofter and his family for only six months; for the rest he had to find other means of support. Fortunately, after the hungry years of the 'forties', fishing provided just this. Starting in 1851, an annual migration began, first to Caithness and later to the whole east coast of Scotland and England. By the 1880's not only were most of the able-bodied young men following the herring as hired men on east coast boats, but many of the women-folk, who had learned gutting, packing and kippering from English girls brought to Stornoway for the purposes, were also earning. This was summer work, and fitted well between seed-time and harvest. In the winter, small local open boats worked long lines for white fish which were dried and salted for local curers as they still are today on the Norwegian coast. Between the 1850's and 1880's there was a "condition of plenty" in Lewis "which would not have been credited by those who judged of the condition of the people by the external aspect or sanitary arrangement of their dwellings".* It was this "condition of plenty" which encouraged the people to stay at home, to sub-divide their crofts, and to live on the proceeds of paid labour rather than on the produce of the croft.

Re-settlement, 1878-1935.

The process of sub-division ceased only when economic conditions became less favourable and emigration began to exceed natural increase. In the 1880's fishing and farming suddenly became less profitable. Simultaneously, and given extra point by the particular distress of the time, agitation for land reform, and in particular for the relief of the most congested districts, became a political issue. This began in Uig in 1874 when an attempt was made to evict 56 crofters from Bernera; hundreds of crofters resisted by force and subsequently marched on Stornoway. They were well received by the proprietors - who appear to have been unaware of the summary and inhumane behaviour of their chamberlain - and to the credit of all concerned the matter ended peacefully. But land agitation continued.

The position in Bernera was eased in 1878 when Linshader farm was deprived of the old township of Kirkibost which was resettled by crofters from Bosta, the latter being let to the Tobson crofters as an enlargement to their pasture. In 1880 new holdings were formed in Hacklete, which had been the grounds-officer's farm (but which, judging from its population, had always contained a number of cottars or sub-tenants). The grazing of Laimshader was probably returned to the Borroston crofters about 1886, having been part of Linshader farm and, in 1891, six new holdings were formed at Lundale, also part of the same farm. At the same period, under the new Act, the crofters of Crowlista, Valtos, and Kneep applied unsuccessfully for enlargements from the farms, but during the nineties the islands of Little Bernera and Eilean Kearstay were taken off Linshader farm and added to the townships of Bernera, and Valtos obtained Pabay Mor.

*Report....on the Condition of the Cottar population in the Lews. (C. 5265), 1888, p. 4.

Thus, towards the end of the nineteenth century, the proprietors were obliged, by pressure of population within, and of public opinion without, to make some concessions to their small tenantry. It may be relevant to point out that this was a period of falling agricultural prices and declining farm rentals; indeed the time was not far off when some farms would not find tenants at any rental:

TABLE 7

Farm:	Rental at c. 1875/80	c. 1885/90
Mealasta	£130	£85
Mangersta	£132	£95
Ardroil & Carnish	£285	£245
Timegarry	£108	£80 (1)
Linshader	£349	£278 (2)

Notes: (1) Small reduction for enlargement to Glebe.
(2) £22 reduction for Laimeshader and Grimersta Lodge.

The crofters of south Uig were in particular difficulty at this time for here fishing declined earlier than elsewhere but the townships remained greatly overcrowded. In 1910 Breanish and Islivig had 14 cottar families, (most of them sharing crofts with the official tenants), and three of squatters, i.e. on the common pasture. Here fishing had almost ceased and the people were almost entirely dependent on their crofts or on employment away from home. In Valtos and Kneep there were 21 cottar families; they had 31 cattle and sheep flocks. Here, too, fishing was on the decline. It was perhaps because of this that commercial weaving was developed in South Uig earlier than in most parts of Lewis. As early as 1900 Uig was classed with Harris, by the local committee of the Congested Districts Board, as producing a superior quality of tweed. Two 30 gallon iron pots were sent out so that enough wool could be dyed at one boiling to obviate irregular colouring in any one tweed. The C.D.B. also made grants for roads, footpaths and "marine works". Amongst the latter the pier at Valtos (1899) was an attempt to resuscitate local fishing, but it came too late.

The Congested Districts Board was the first government agency with funds at its disposal to aid the crofting townships. One of its largest grants went in aid of the Carloway Road (or Pentland Road as it is now known). This scheme arose out of an abortive proposal for a railway from Loch Carloway to Stornoway. It was thought that this could enable trawlers and other large fishing boats to land their catch for quick transport to Stornoway and so to the mainland whilst the fishing vessels returned to sea with minimum delay. The road, an excellently engineered one, is still not properly surfaced. A more effective C.D.B. - aided scheme was the resettlement of crofters on Mangersta Farm, the rent of which had fallen to £70 and which the proprietors were willing to break up. Thirteen new buildings were formed here and the first harvest was taken by the new settlers in 1911. The crofters' rent was fixed at £73 and the C.D.B. paid £566 in grants to purchase the sheep stock and improvements, and towards the cost of fencing. About the same time the Board paid a grant to the township of Garenin for fencing a substantial enlargement to their pasture, obtained off Dalbeg. Here, and at Reef farm, small-holding resettlement schemes were vetoed by the Crofters Commission whose experts regarded the areas as unsuitable. Both have since been re-settled by crofters.

TABLE 9

233 change in area, then the amount of stock allowed, per pound sterling of rent, ought to be
427 changed, too.
656
[175] This does not appear to have been done in Uig although in Stornoway parish the soum per pound was increased after rents were reduced in the late nineteenth century. More recently, the Crofters Commission, in re-stating soumings for some townships, has generally (but not invariably) applied the soum to the 1886 rent, regardless of the wording of the 1912 regulations. This may appear to have the merit of consistency and, insofar as crofters pay any attention to the Regulations, it satisfies them because the greater (1886) rent gives them a larger soum and less likelihood of being criticised or penalised for overstocking. However, it perpetuates inconsistencies which originated during the nineteenth century when the stock allowed per pound sterling rent was not reduced although total rentals were increasing as squatters' and cottars' holdings were added (see page above). Moreover, the old souming referred to the old type of highland cattle which were much smaller beasts than those kept today, and it assumed that the shieling pastures would be in full use. A further complication arises because about 1920 some townships acquired substantial enlargements but the soumings do not appear to have been adjusted. Altogether it is little wonder that the Grazing Regulations are seldom observed, for they seldom bear any close relationship to the grazing capacity of township lands. Proper observance of carefully revised Regulations, in which unlimited substitution of sheep in place of cattle was specifically forbidden, would be of considerable benefit to the crofters.

241 The inbye, or croft, land is invariably separated from the common pasture by a ring
233 fence, the gates of which are generally closed for protection of crops from May to
417 November. Progressive townships are installing grids to obviate the twin nuisances of
[178] traffic interference and straying stock. The fencing of individual crofts was rare until the 1930's and is still by no means general. The inbye land is, in many townships, the best winter grazing and its division into innumerable tiny fenced patches, whilst advantageous for cultivation, would restrict the movement of stock in search of water and shelter; in a predominantly pastoral economy complete enclosure of individual holdings is not necessarily an advantage. This problem will be discussed in Part III but, in the present
[184] context, it is relevant to point out that the small crofts of Lewis contrast strongly with the larger ones of, for example, the Uists and Tiree. Therefore, what may be advantageous in the latter may be retrograde in much of Lewis.

The lay-out of the crofts aggravates this problem. The long narrow stripe of the 1850 lotting, well-suited to spade cultivation and common winter grazing, may require four or five times the length of fencing required by an equi-dimensional croft of similar area. If fenced the stock may be deprived of both water and shelter; since arable cultivation has become relatively unimportant a suitable solution to this problem might be to fence a small potato plot near the house and to put the rest of the inbye down to sown grass in three or four communal parks in which grazing could be properly controlled. A particular problem is posed by crofts which have been sub-divided. These may take the form of strips as much as half a mile long by 10 yards wide or, more commonly (and much worse), of piece-meal sharing of innumerable plots, a system known locally, but incorrectly, as 'run-rig'. This is seen at its height in Knoep (fig 22), where every croft in the township is affected. The problem does not arise in townships with large crofts, which are usually more nearly equi-dimensional. These are mostly the result of re-settlement schemes and have long been fenced, (see, for example, figure 15).

Crofter-tenants.

162 An analysis of crofter-tenants according to age, sex and occupation (table 12) provides
427 several important clues as to the present unsatisfactory state of crofting. More than
463 one-third of the tenants are over 65 years of age; a further 16% are absent, some of these may also be over 65, others are younger people working away from home, a few are tenants

162 of crofts in other districts, despite the legal
427 two miles of his croft. Thus half the crofts

511 It is obvious that crofting no longer affords a livelihood in Aird; the only two families
46 without ancillary occupations are those where all the members are elderly. Of the other
288 with members in the working age-groups, five have one or more members employed in a civilian capacity at the R.A.F. station and there are five regular weavers.

621 Aird used to be a self-contained community; the land was fully cultivated and a certai
178 amount of fishing was carried on in spite of the difficulty of drawing up the boats over the rocky beach. Now it is prosperous, but very much dependent on the R.A.F. station, an if this should ever close down, most of the younger people would have to leave in search o other employment.

CHAPTER SEVEN

VALTOS, KNEEP AND REEF

by

David G. Symes.

131 On the eastern side of the Aird peninsula, facing east to Loch Roag is a secondary
133 peninsula of more moderate, but none-the-less broken relief. This, together with an adjacent area of the main peninsula, the islands of Pabay, Vacsay, Vuia Mor and sever smaller islands, comprises the territorial limits of the townships of Valtos, Kneep and Reef.

133 This secondary peninsula is accidented in the extreme, with outcrops of bare rock and steeply angled small hills. The relief is greater in the west (summit 450') than in the east (summit 275'). Relatively level land is to be found only on the machairs of Reef and
133 Cliff (the latter only poorly developed) and on the glebe at Uigean. The Reef machair,
134 about 180 acres, consists of a succession landwards of tidal sands, a belt of sand dunes (c. 20' O.D.) and a sandy plain sloping gently inland towards a reed filled lagoon. The machair at Cliff is approximately 40 acres in extent; here there are fixed dunes and, in addition, the sand has been blown inland to at least 100 ft. O.D. Except where the mach sand has drifted upslope to produce a "brown machair" of mixed sand and peat, the thin soils of the Valtos peninsula are predominantly peaty. Although the length of the peninsula faces north the extremes of Atlantic weather are moderated by the protection afford by the Aird peninsula and the islands of Pabay and Vacsay.

175 In the period before the lotting of crofts the whole peninsula was occupied by some five
424 clachans - Valtos, Cliff, Kneep, Uigean and Reef - some of which shared common pastur
341 During the early part of the nineteenth century and earlier, apparently, than the 1850 lott
633 carried out in most of Lewis, crofts were allotted in each of the clachan areas: Valtos an Cliff shared a common pasture and so became one township; similarly Kneep and Uigean were combined.

175 In Kneep it seems that the croft boundaries were not accepted by the crofters. Certa
311 basic divisions between groups of crofts (usually three in number) are discernable today,
427 and within these basic divisions a certain regularity of distribution of strips persists, but

/facing p. 42/

1/A. [See p. 45 for discussion of chart--Analyst]

the crofts at Kneep are still highly fragmented: the fifteen crofts comprise over one hundred and eighty separate arable plots. The lotted crofts at Reef were cleared in 1842 to provide land for a sheep farm. Plans to clear the remainder of the Valtos peninsula were thwarted by the Fisheries Board because Valtos and Kneep were then good centres for the white fish industry. As late as 1892 Valtos and Kneep had forty boats, providing employment for one hundred and forty-five men. Valtos with thirty-two boats and one hundred and twenty fisher-men was second only to Carloway as a fishing centre in Uig. With the prosperity of the fishing industry, the population of Valtos and Kneep had risen rapidly - from 467 in 1841 to 659 in 1891. Some, at least, of the subdivisions of Kneep date from this period. Reef was scheduled by the Deer Forest Commission (1896) for resettlement by crofters and in 1908 an attempt was made to do this, but agricultural experts advised against it, on the grounds of poor water supply, scarcity of arable land (only ninety-three acres old arable) and the risk that, if cultivated, the machair would suffer wind erosion. Nevertheless, in 1921, Reef was resettled by ex-servicemen from Valtos and Kneep. At the time the sheep farm was only carrying a stock of one hundred and seventy sheep - less than half the crofters' sheep stock in 1959.

Tables 15 - 18 summarise the more significant points of the economy of the Valtos peninsula. Table 16 illustrates the fact that the economy is in decline. Only two-thirds of the total possible units are being worked. Many of the crofters have abandoned their crofts and the younger generations are unwilling to take over. Of those remaining to work the crofts 18% are over sixty-five, and a further 47% are between forty-five and sixty-four.

195 After the first World War re-settlement schemes went ahead with renewed vigour. Men serving in the Forces expected land to be available for them on their return and they
311 were impatient to get it. By this time the Lewis estate belonged to the Lewis and Harris
427 Development Co. - in other words to Lord Leverhulme. The farms of Mealasta, Reef,
657 Carnish and Ardroil were all without tenants; Leverhulme agreed to break them into
[71] crofts, the Board of Agriculture surveyors were speedily put to work, and the new settlers were able to commence cultivation on March 1, 1921. Timsgarry farm, with which was the Uig shooting lodge, was in the hands of a tenant; but the Board obtained possission, reserving a small area around the lodge for amenity. Croir farm, Bernera, was also broken up. More than 50 new holdings received enlargements to their common pastures; details are given in Figure 10 and table 8, (pages 22 and 23). The schemes were done in haste, the Secretary for Scotland pushed them forward in the face of some opposi-. tion from Leverhulme. Here, as elsewhere, the ex-servicemen were restive; land raids and violence, with inevitable political repercussion, were feared.

In 1924, Linshader farm was threatened by land raiders. As a result this, too, was broken up and 10 new holdings were occupied as from Whitsuntide, 1925. This was part of the Grimersta sporting estate and the proprietors required that all the ghillies be given crofts. Linshader was not particularly suited to crofter-management: it consisted of 49 acres of old arable land and more than 8.000 acres of rough pasture, the furthest part of which was five miles distant and without road access. When the Land Court fixed the souming the following remark was recorded:

"Under a club stock" (i.e. a single flock) the moor "might have been exploited to a very different extent, but in view of the fact that individual stocks are to be kept" (i.e. each crofter his own shepherd) "which is not conducive to hefting, ... 30 sheep per share will be ample. If the whole outside ground were being fully made use of by the sheep stock the grazing of ten cows should do no harm .... but the wintering afforded on the holdings does not justify a larger souming" (than one cow). It had, in fact, been the practise at Linshader farm to buy in young cattle for summer grazing, and to send away the lambs to the Dingwall area for their first winter.

Finally, in the thirties, two long established cottar families at Aird Bheag an isolated spot on the Uig shootings, applied for and obtained recognition as crofters. Their holdings have since been abandoned and now form part of the sheep farm operated by a syndicate of four Breanish and Islivig crofters. Finally, in 1935 a further 12 new holdings were formed by a partial break-up of Garynahine farm. Thus in all, 140 new crofts and 45,000 acres
[161] have been added to the crofter holdings of Uig since 1878. During that period the popula-
[162] tion of the parish has declined from 4,500 to 2,700. Neither the formation of new crofts, nor the enlargement the old, has prevented depopulation. Little, if any, more land is available and depopulation continues. The only hope, now, is to make the existing land - individual holdings and commons alike - more productive.

Table 8 and the map, figure 10, illustrate the progress of resettlement.

Crofts and Crofters.

491 The parish of Uig is now mainly owned by five small limited companies: Uig Crofters,
427 Bernera Crofters, Grimersta Estate, Carloway Estate, and Lewis Island Crofters. In
311 addition, when Lord Leverhulme sold the Lewis estate a few crofters accepted their holdings as free gifts; consequently they lost legal crofter status (which is confined to tenants) although they continue to share in their respective townships. More recently four crofters in the south purchased some 2,000 acres of rough sheep grazings, including the now defunct settlement of Ard Bheag. There is no official record of the extent of crofters' land, but we accounted for some 95,000 acres (table 9). The remainder con-

Note: 'New' townships, for this purpose, are those settled since 1900.

361
632

In detail the arrangement of the townships varies. Certain features are common: all inbye land and, consequently, all settlements, are coastal (except Lochganvich). Each has common pasture adjacent to the inbye and many have further areas of common - former shieling grazings - some distance inland (figure 1). This division of the hill grazings is to some extent nominal because fences are often absent or ineffective. Uninhabited islands, on the other hand, require no fences, and are particularly valuable for winter grazing; the smaller of them provide convenient natural paddocks for bulls and tups when out of season. The management of all these common pastures is controlled by the township committees. Unfortunately the most important aspect of stock management - control of numbers and maintenance of a proper balance of sheep and cattle - is almost universally neglected.

[171]

233
427
656

The total stock which each croft may put on the common pastures - the 'soum' - is defined in the Regulations. In the case of townships re-settled in the present century a specific soum is placed on each croft but, in most other cases, the old practice persists of stating the soum in terms of rent. Thus the soum of each croft may be defined as 1 cow, 1 two-year-old and 8 sheep per pound sterling rent (this is a very common souming). Such soumings have been in existence since time immemorial; they are mentioned in 1836*. Many of the Uig townships had their soumings stated by the Land Court in 1912; in most cases the soum was given "per pound sterling of rent" (presumably 1912 rent), but in a few "per pound sterling of rent payable in 1886". The rents had been substantially reduced in 1891, thus 1912 and 1886 rents were very different. Any township has a certain limited, stock-carrying capacity; therefore, if the total rental is thus changed without

[113] * New Statistical Account, Vol. XIV, p.148.

[TEXT CONTINUED ON PAGE 29]

194 Alluvial soils have developed along the lower reaches of Amhuinn Thoraghair and the Erista river.

There are no trees apart from an occasional stunted rowan or willow - willows for
197 creel making grow still in some old garden enclosures. Hedges, too, are rare so, although
[82] individual houses are often carefully sited, there is little cover and the townships as a whole are very exposed to westerly gales. The natural vegetation developed on the machair is of fine closely matted grasses with a good deal of natural clover - very similar to that found on chalk downland. On the peaty moorland the usual moor grasses mosses and heather are dominant, though little encroachment by bracken was noticed.

In Crowlista the strip layout of the crofts dates from a lotting about 1850, (Figure 14)
311 in the new townships, laid out about 1921 (Figure 15) the majority of the crofts are
361 less strip-like and do not run to the shore. Indeed in Ardroil and Timsgarry only five
427 out of twenty-two reach the shore and the rocky headlands with their machair are valuable parts of the common pasture. The six crofts in Carnish run from the shore at the foot of the esker up its flank towards the southwest and almost to its summit. They also have one or two small plots each on the machair.

Crofts in Ardroil are in one piece. An old cattle road forms the north west boundary;
[133] from this they rise, steeply in places, to undulating moorland just over 200' high. Numbers 5 - 8 Timsgarry are strips across the Erista valley, rising northwards to just over 170'; 2, 3 and 4 are allotted to make use of arable land on the lower slopes of Knock Valabrie. The houses of crofts No. 1 Timsgarry and No. 1 Ardroil are the former farmhouses.

[417] In Crowlista most of the crofts remain unfenced but in Carnish, Ardroil and Timsgarry all are fenced and many of the fences were being repaired or replaced in 1959. They are not open for common grazing during the winter. Patches of sown hay are fenced within each croft.

There are six recognised croft-holdings in Carnish; one is sub-let so that there are
[36] only five "operative" units; two of those are not worked. One has been resumed by the proprietors and is being quarried as an extension of the main quarry between the township dyke and main road. In Ardroil each of the fourteen crofts is worked as a unit - though two carry no stock; in Timsgarry eight crofts are worked as seven units.

In contrast to the above, the old settlement of Crowlista has twenty-five recognised crofts but, by amalgamation and sub-letting these are worked as fourteen units. The Crowlista crofts are small - fourteen are 4.0 acres or less and of those only one is worked as a unit. Crofts as small as 1.5 acres and with a scum of eight sheep can never have been intended to support a family; they are the result of sub-division in earlier generations; the remains of two piers and a curing house point to the importance of
[464] fishing in the past. Twenty-one men were employed in fishing boats about 1914. Sub-letting usually takes place between relatives; of some of the fourteen operative units are quite complicated. One example will suffice (croft numbers are here replaced by letters to prevent publication of personal matters):-

Crofts a, b, c and d are worked as a unit (although they are not adjacent). The tenant of a and b sub-lets c and d for grazing; he also helps with the work on yet a fifth croft. The present b is half of an original croft. West of the road the original croft is held in fixed runrig between b and another croft, not part of this multiple "working" unit; east of the road it has been divided into separate strips. The tenant lives on b.

233 hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

231 Parts of the common pasture - usually the machair, are set aside for wintering hogge
but the usual practice is to keep as many as possible on the croft. The scum as a whole
[427] is not enforced but shares in the wintering parks are adhered to. For example:- Timsgarry Glebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hogge on it. In Ardroil one share allows one cow or four yearlings or eight sheep or eight hogge
[232] on the machair - in practice it is the best hogge that are sent. The minister at Timsgarry, who is much interested in sheep husbandry, has bred a heavier sheep with longer legs by crossing the Hebridean blackface with Swaledales and these seem to be doing very well; the minister is more attentive to his sheep than are many of the crofters, but some local crofters are showing interest in this crossbred. The lambing percentage, so dependant upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.*

Enquiries show that some crofts in each township far exceed their scuming but because others carry no stock the four townships are understocked according to the total scum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the sheep scum, Crowlista is overstocked by 130%, while the other townships are understocked.
[235] Some of the figures used for sheep stock were approximate or estimated. Nearly all crofts keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.[1]

241 Part of the hill common west of Crowlista was cultivated until the beginning of the
175 present century, at which time the township was overcrowded with two or three houses on
[361] each croft. A similar area west of Carnish was cultivated and old lazy beds, now grazed, are to be seen on slopes south of the road in Ardroil, in the valleys of Amhuinn Thoraghain and Allt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this area, still to be seen around and beyond Loch Suainaval were in use until 1936 - '35. (Figure 5).

464 Ancillary employment is sought by all but nine of the thirty men under sixty-five in
these townships and the wives of two of the 'full-time crofters' have regular employment.
228 There is no commerical fishing by local boats though the Berneri lobster boats are seen frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port' shown on the O.S. map near the site of the clachan in Carnish, point to the former importance of fishing.

288 At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroil, three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were in use and two tweeds woven a week bring in a useful income but the supply of weaving is irregular. The future security of these weavers depends on the prosperity of the Harris tweed industry.

464 Mitchels's sand and gravel quarry at Carnish provides employment for from three to
[345] ten men. Five men from Ardroil and one from Carnish are employed there at present.
[172] The Aird R.A.F. station draws most of its civilian employees from Aird Uig but two
[317] Ardroil men work there. One Crowlista man is employed at the hydro-electric scheme
[317] site at Gisla and this work will last for another year or two. Employers recognise the
[446] particular needs of their crofter employees and 'days off' are allowed for sheep fanks and other necessary work.

* The minister's ewes gave 103%.

the family - and as a place for retirement.

000 It is easy to list schemes for improvement and change:- dairy
with milk, poultry and pig keeping on a commercial scale, cultivati
tourist industry, forestry on a small scale, lobster and crab fishin
would require capital not available in the townships, careful plann
tration by people with real knowledge of this area and its people.
potential production of the crofts is by no means realised.

CHAPTER SIX

AIRD

by

Madge Phillips.

131 The little township of Aird is an isolated and old-established c
the western side of the steep and narrow valley of the Amhuinn Gil
133 north of Crowlista. After leaving Loch Meacheit, the river flows
gorge (at the mouth of which are the ruins of the old corn-mill), th
427 flood-plain into the rocky bay of Camus na h-Airde. The crofts,
133 arrangement and varying in size from 3½ to 7 acres, each original
strip of the flood-plain, stretching across from just beyond the rig
the steep, rocky slope above the left bank and widening out over th
between the 100 ft. and 200 ft. contours. A number of the crofts
larged, gaining extra land on the right bank of the stream, whilst
ground to the north or south.

1. [See figures 12 (facing p.34) and 17 (facing p.3

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across
231 the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos
654 in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird lacks the advantages of the machair land found further west. To the north of the village there is now an R. A. F. radar station on Rudha Caol, built on what was part of the common pasture. It dominates the landscape and makes a considerable difference to the life of the inhabitants.

361 The township, though isolated, is reached by a good road which leaves the main road
497 at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
493 butcher's van on Saturday, and the local people are also allowed to shop at the N. A. A. F. I. within the Camp. The road through the village approximately follows the line of the 100 ft. contour and all the houses are built directly on to the road, with byres, weaving sheds and other buildings behind, whilst in most cases hens are kept on the steeper slopes below
505 the road. Thus the settlement has far more of the appearance of an English village than
542 have most crofting townships, but there is no shop or post office. The majority of the houses are stone with slate roofs and fairly large, though some of them have been built for
354 more than fifty years. All have electric light and their own water supply and several have
312 modern byres.

427 There are ten crofts, as the enlargement of one of the original nine was subsequently
311 split off to make a separate croft. Of these, one tenant is an absentee and another an
491 elderly woman who does no cultivation. In both these cases, grazing is let to others so that there are actually eight operative units. The crofts are fenced in their upper portions, but in most cases the fencing does not extend down to the river and there is free access to the single concrete footbridge which spans the stream.

241 The only crops now grown are oats and potatoes and a few vegetables, with some sown grass; natural grass provides most of the hay crop. Lime and shell sand and artificial fertilisers are used; the two former particularly on the ground near the river where the cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse.
407 Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
312 tractor is possible. Before 1914 most of the land within the original turf dyke was culti-
824 vated; here was grown and ground at the mill for meal for barley bread. Seaweed was
231 extensively used as a fertiliser and most of the families kept eight or nine cows, so that there was a more plentiful supply of manure. Now, six of the families each keep one cow for domestic milk supply (two of the others each keep a goat). The township possesses no bull, but make use of those at Valtos or Ardroil.

253 On the other hand, the sheep soum is generally exceeded; instead of the entitlement of about 200, the total flocks grazed on the township pastures are approximately 500. The lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented this) and wedders are usually sold at the age of two or three years in Stornoway - many in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females.
Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there are only three married couples) and there are two children under 15. Nevertheless, most of them are complete families; only one person lives alone; no members are reported as
166 periodically working away, no men and only two women are permanently away. Neither has there been much emigration since 1939 - five women only have married out of the parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 - 44 age-group is a new-comer to the district and does little croft work.

/facing p. 41/

162 of crofts in other districts, despite the legal requirement that a tenant shall reside within
427 two miles of his croft. Thus half the crofts in the parish are tenated by persons who
423 cannot be expected to make the best use of them. This implies no criticism of the people concerned, it is a criticism of the system. Of 314 resident tenants under 65 years of age, 43 are women; of the men, 170 have regular employment including fishing or weaving, 55 take casual or seasonal work as and when they can get it. Only 46, or 7% of all tenants, are "full-time crofters" and, in fact, most of these are either invalids, disabled, or over 60 years of age. Thus in Uig, unlike the southern Outer Hebrides, most crofts are at best a spare time occupation, at worst merely a house site carying special privileges. The table also demonstrates that the size of crofts has little bearing on occupational status; this is inevitable in a rigid system under which a man has no control of varying the size of his holding according to his needs. Some young tenants inherit crofts far too small for their family needs, whilst many elderly tenants, and women, have crofts which are too large for them to maintain.

241 It is not surprising, then, that many tenants do not wish, or are not able, properly
427 to cultivate or stock their crofts. A few, however, are particularly interested in agricultural production as a means of livelihood. Some of these have acquired extra crofts, and so built up much larger units. This may be done by acquiring tenancies either in the crofter's own name or that of his wife or a close relative, or by sub-letting. About 30 crofters in Uig are tenants of more than one holding, at least 20 work holdings held in the name of close relatives, and at least 120 have sub-let holdings. These figures are certainly too low: sub-letting without the consent of the proprietor or Crofters Commission is illegal. Nevertheless it is common, and it is generally unsatisfactory because the sub-tenant has no security of tenure and no right to compensation for improvements; consequently sub-let crofts are often neglected and sometimes over-grazed as well. Controlled sub-letting, for a stated minimum period and with the right to compensation, would regularise a well established practice and encourage the formation of larger units, better able to support a family.

A converse of sub-letting is unofficial sub-division. There are a few cases of cottars - usually relatives living in a second dwelling house on the croft - sharing the croft with the tenant; but this formerly widespread practice has all but disappeared. Such de facto "crofters" share the common grazings, as do "squatters" - persons with houses on the
162 common land - who keep stock. Thus neither the number of crofter-holdings on the rental
241 (699), nor that of crofter-tenants (663), is any guide to the effective number of potential
427 agricultural units. Of the crofter-tenants, 100 are absent and some of those who are resident sub-let their crofts. After making these allowances the number of de facto holdings becomes 518; to these must be added 39 cottars, squatters and others (including a few tenants of council houses) who keep at least a cow or five sheep, and 23 agricultural holdings without crofter status. Thus there are 580 potential agricultural units in Uig.

[233] That is not all. Of these 66 have no cattle, and 162 carry less than half their soum,
of which 22 have no stock at all. Little more than 400 holdings can reasonably be said to
241 be agriculturally effective. This is an indictment, not of the crofters, but of the
427 agricultural structure of the system. This neither provides viable holdings nor does it enable those who wish to acquire enough land to be agriculturalists to get it, even though much land lies unused or ill-used. In short, the system is too rigid. In consequence, de-population goes on apace whilst potential resources are neglected. Three-quarters of a century of legislation and financial aid have, in the main, encouraged the development of crofts as homes for the elderly and as hobbies for those in other employment. Very reasonably, many crofters complain. But very few realise-or are willing to admit - that the security of tenure and other privileges won in 1886, if too rigidly maintained, may ultimately bring about the decay of the very communities which they were intended to protect.

CHAPTER EIGHT

LITTLE LOCH ROAG DISTRICT

(Meavaig, Caryshader, Ungshader, Geshader, Enaclete and Gisla).

by

Annis Heawood.

133 Little Loch Roag is a narrow sea loch extending southwards about twelve miles inland
[133] from Loch Roag proper. It has been formed by glacial erosion picking out one of the
194 n. n. e. to s. s. w. lines of weakness characteristic of the Lewisian gneiss. Although generally steep-sided, recent glaciation left much ground moraine and this material, best preserved on the less steep slopes, provides arable land for several small townships on or near its western shores. The eastern shore is the more rugged and although a few small townships once existed there is now only the small farm and shooting lodge of Scaliscro. At the head of the loch is an estate cottage for Morsgail Lodge which is a large mansion with extensive fishing and shooting rights, grandly isolated about a mile inland from the main road.

361 The district here described includes Gisla, near the head of Little Loch Roag, Enaclete,
[133] Ungshader, and Geshader, on the western shores of Loch Roag proper. All these are strung out on or close to the main road. Meavaig, like Gisla, is a small farm but also
365 functions as something of a metropolis for south Uig; it has the post-master, whose other functions include registrar and receiver of wrecks it has two churches, a telephone exchange, the district doctor and manse, and a petrol pump. At the time of our visit it was also the base for the 'bus service. Its metropolitan functions arose in the days before the road replaced a ferry boat service from Callanish; here the mails were landed until some date in the 1920s, and here, too, the estate kept coach and horses for transport to Uig lodge, three miles further west.

361 There is no record of the original settlement of the four crofting townships, nor of
365 Gisla, which was a township (or 'joint farm') of five crofters until about 1850. Some modern houses and bungalows have been built, many with easier access to the road than
[132] the old black houses, now often used as byres. Water supply does not seem to present a serious problem because of the extensive moorland gathering grounds to the west, but there are not at present any water-supply schemes. Electricity is, of course, available. Caryshader and Enaclete are on the main Stornoway road being served at present by the 'bus and by vans selling meat, groceries and fish at least once a week. Enaclete has a sub-post-office. Geshader is less fortunate since, although vans call regularly, 'buses must be met at the junction of the unsurfaced track and the main Stornoway road, where the school serving this district also stands. The track has been extended in recent years so that it now reaches all the houses. Ungshader, however, is smaller and although it has had similar delivery arrangements, it is now a dying settlement largely due to its inaccessibility.

427 The crofts are mostly regular in shape on the landward side and fenced except where
the land is very broken as in northern Enaclete. In Caryshader there are fourteen legal
632 crofts which at present are worked as eleven units; one is used only as a holiday home
311 by its owner-occupier and there is one squatter on the common grazing. In Geshader there are eleven crofts, each worked independantly; Ungshader has four crofts but the

427 Joint tenants of one have moved to Geshader while continuing to work the Ungshader land.
632 Another is preparing to move to Enaclete and yet another lives on a feu at Loch Chroistean
311 Cottage. At present, three working units remain. Enaclete consists of nine crofts with ten units, one being rented by joint tenants.

221 The rhythm of work is similar to that in other parts of western Uig. Potatoes and oats are planted in April followed by lambing and peat cutting in May. In June and July the sheep are shorn and subsequently sent to the common grazings. In August the peats are carted, once they are dry, by lorry direct to the crofts. Hay-making follows. The lambs are weaned in September, harvest is then carried in and tupping and statutory dipping take place in November. The sheep are then returned to the township grazing though the lambs
241 may be fed with hay on the croft. There is little regular crop rotation and only a small number of crofters seem to undersow oats, thus improving the quality of future hay crops. Gardens are not important and only provide for family needs but Caryshader particularly has a number, some growing flowers as well as vegetables. Fertilisers vary widely from croft to croft as well township to township. Enaclete potatoes are still grown near the shore and thrive on seaweed; those of Caryshader are usually fed on artificials.

231 Most crofters keep one milk cow with a calf; a few rear a young beast for the autumn sales in Caryshader. However, some now rely on their neighbours for milk in return for grazing and one croft has turned to goats, as giving less trouble. The bull for the whole district is a beef shorthorn and is kept on Geshader -Ungshader common grazing as it is completely fenced; and Geshader is responsible for its upkeep.

233 Lambing seems to have been generally good in 1959 but it was not easy to get exact figures. The Morsgail Estate and Gisla farm also run considerable flocks. The common pastures total 3,119 acres with an enlargement, formerly used as shielings, of 1,215 acres for Enaclete, Geshader and Ungshader near Loch Suainaval, and for Caryshader 88 acres
[34] on Floday island. The shielings have been disused since the war. Peat is normally cut to the west of the road but at least one elderly tenant in Geshader has kept a section of his croft for this purpose to save the effort of working further afield.

241 Generally speaking the land now cropped only represents one third to one half of that
178 worked by spade 20 - 50 years ago when the crofting population was larger and when much greater numbers of cattle were kept through the winter, thus requiring more potatoes and
231 more oats. The cattle numbers are much less than the total souming but sheep are in excess. In Enaclete, at least, overgrazing by sheep has caused a decline in grazing quality.

464 Clearly in these townships, apart from the very few crofts still fully cultivated, the means of livelihood is sought elsewhere. At present there are altogether fifty-three men in the working age group (15 - 64) in all four townships. Of these fourteen are away, nine permanently and five periodically. Thirty have regular or periodic employment besides crofting and of these seven work at Gisla on the hydro-electric scheme, seven weave, some of them part-time, four hire out vans, two do post-office work and others have varied occupations while only three are full-time crofters. At present there are few men in the Merchant Navy and fishing does not provide an occupation although many share rowing-boats in their spare time, and fish for domestic use.

162 The population as a whole is ageing and of the group between 15 and 64, forty-four
[164] (roughly 30%) work away permanently or have emigrated. It is noticeable that there are few crofts worked by people with young families

000 In conclusion it may be re-emphasised that the fate of the crofting townships depends more

Brenish, at the end of the tarred road which also serves Islivig, is forty miles from Stornoway. On the thrice weekly bus the return fare to Stornoway was £1, and freight cost half-a-crown for a hundredweight, but because of competition from privately owned vans the bus service ceased in 1960. Mangersta is reached from the same road by about a mile of untarred side-road of indifferent quality; formerly the only access to it was by a footpath over the sands to the south. General merchandise, fish and meat are supplied by weekly vans; there are no shops. There is a post-office at Islivig; banking facilities are supplied by a mobile bank.

The majority of the crofts are long narrow strips, with those in Mangersta being somewhat more compact. The area ranges from two to nine acres, with an average of about four acres; in Brenish and Islivick only about half is usually arable. All the crofts - or croft-units - are fenced, the work having been completed in Brenish in 1959. There are twenty-nine crofts in the rental for Brenish, ten for Islivick and thirteen for Mangersta; but, owing to amalgamations of various kinds the number of operative units is considerably less - fourteen in Brenish, five in Islivick and ten in Mangersta. There are no cottars.

As soils are reasonably good and comparatively free from rocky outcrops, the arable patches are large enough to be cultivated with a horse or tractor. There is a tractor in Brenish, and four horses, a horse in Mangersta and two in Islivick. All of these are hired for ploughing and carting peats. Very little work is done with the spade, unlike many of the other Uig townships.

While the general rhythm of township work through the year is similar to other areas, here the sheep are wintered up on the hills; some crofters winter lambs on their crofts. Brenish crofters are allowed to winter eight sheep, (or sixteen hogg, or four year-old heifers), on Mealasta Island - hogg are usually sent since their loss, by falling over the cliffs, is less serious than the loss of heifers. Eilean Molach is used by Mangersta crofters, who are allowed two sheep each in summer.

The only crops grown are potatoes and oats, with "black oats" (Avena strigosa) on the sandy soils in Mangersta. Since seed for "black oats" is unobtainable commercially, the crofters save their own. A grass mixture is sown by the majority of crofters for hay, to qualify for the subsidy.

The extensive hill and mountain pastures are not separately fenced; sheep from all three townships graze over all. If the total sheep stock of the townships (about 3,300) is compared with the souming figures it is found to exceed the soum by about 50%. On the other hand, fewer cattle and horses are kept than formerly so that taking the total stock for all animals (horses, cattle and sheep) and comparing with the actual stock now carried, the area carries only 87% of the stock which the soum allowed. In the two older townships the souming was reckoned according to rent, being one cow, one two-year old and eight sheep for each £1. In Mangersta, however, the soum was one horse, three cows, one heifer, two stirks and twenty-five sheep for each croft.

Lambing percentage is about 80, and ewes form about 60% of the total sheep numbers (excluding lambs). In this district some wedders are kept for three years and then sold for meat, but the main income is from wool, about three pounds weight from each sheep, which sells at up to four shillings a pound.

Most crofters keep one or two cows, and the calves are normally sold in the autumn or spring sales. Brenish and Mangersta each have a bull, and in the three townships there are sixty-seven cattle and thirty calves. Shielings, formerly used for about seven weeks in

Notes:
(a) The total areas of common and inbye land for each township are given in the text.
(b) Soumings have been calculated according to the rent operative at the date when the grazing regulations were first made unless some other rent is specifically quoted in the regulations.
(c) The sheep totals are known to be incomplete but the proportions (ewes/lambs/others) are as reported (see Appendix A (2)).
(d) Where there is a specific soum for a horse this has been added, (half to the cattle soum and half to the sheep soum) after allowing for any horses actually present.
(e) Where there is a soum for two-year old cattle this has been included in the cattle soums at the rate of 3 two-year olds to one cow.

beginning of the resettlement movement which has given the modern crofters of the district almost all the lands formerly occupied by small tenants. This process was completed in the Bernera region soon after 1918, and the problem now - one which is obviously going to become increasingly important - is not to give the crofters more land, but to find active crofters for the existing holdings (see Chapter III for more detailed information on clearance and resettlement).

361 632 427

The ground plans of the existing settlements vary considerably, depending mainly on the terrain. Where a township is spread along a fairly straight coast the natural tendency is for the croft boundaries to run at right angles to the coast and for each house to be set on its own croft. The best examples of this are Hacklete and Kirkibost, where an early nineteenth century (i.e. pre-clearance) lotting was readopted when the township was re-settled in 1878. Linshader, Lundale, Crulivig and Earshader also follow the same type of layout as nearly as possible, but Tobson, with the exception of Valasay, is intermediate between a lotted and an unconsolidated township. Croir also differs: it was laid out in 1921 but the disposition of the potential arable forbade a coastwise organisation. The site of Breacleite is greatly broken by lochs and a sea inlet, and consequently an essentially regular layout based along a main Loch Breacleite - Loch Beg Breacleite axis, appears somewhat complicated. The accompanying diagrams contrast the control exercised by physical conditions at Croir with the subordination of physical conditions to a simple lotting plan at Hacklete, (Figure 28).

361 342 178 632

Within the townships, with the exception of Kirkibost, the distribution of settlement seems to have changed little since the original lottings, for in most cases the sites of the old and present dwellings are little further apart than is dictated by constructional problems. It would appear generally that black houses were universal in the nineteenth century except for the farmhouse at 1 Croir (the oldest 'white' house in Bernera), Thule House, (18 Tobson), possibly the tacksman's house at 11 Hacklete, the former farmhouses at 20 Kirkibost and at West Earshader. However, with the establishment of Congested Districts Board and of Board of Agriculture grants, housing was improved, early examples being 5 Hacklete and 10 Breacleite. The resettled townships generally had improved accommodation from the start. Improvement has greatly accelerated since 1951. In most cases at the present time housing is of very high standard, only one blackhouse and one near blackhouse are still occupied.

312 54 162 354

Water supplies and sanitation are less satisfactory. Most crofts by now have their private water supply, thought it is hoped that mains schemes may be constructed within the next few years. Sanitation varies in standard and in places there are still open ditches, but all the newer houses have water closets. It is worth remarking in this connection that tuberculosis is almost eliminated. Electricity has been available since 1952 to all crofts and most are connected, though not necessarily in every room. Cooking is sometimes by electricity but more commonly by Calor gas and a peat-fired range or stove (open or enclosed). Peat is cheap to those able to gather it themselves. Where, however, help is needed to carry the cut and dried peats to the nearest road, difficulties may arise. The cost of hiring labour for peat cutting may be such that it is cheaper to buy coal.

171 174 176 178

Access to Bernera by road is now comparatively easy. Where formerly Loch Roag provided the highway of communication, the road built to Earshader after the Great War, and the £87,000 bridge to Bernera Island, built in 1953, have caused a revaluation of sites. Linshader is approached by a tarred branch road and the other Bernera shore townships lie upon the narrow and twisting main road, though four of the six Lundale crofts have no connection with it, and two of the Crulivig crofts, and West Earshader, are somewhat isolated. On Bernera Island the old cart track from the pier at Barraglom across to Tobson and Croir has been somewhat re-aligned since the construction of the bridge. This is a good tarred road, as is part of the branch to crofts 1...8 Croir. The old road to Kirkibost was tarred in 1959, though three outlying crofts near Barraglom were still without a road suited to vehicles, and the branch within Breacleite remained untarred. There is a new road to Hacklete from Breacleite which provides tolerable, though circuitous, communication. Valasay is one of the most isolated settlements in Bernera, linked with Breacleite rather than with Tobson by the footbridge and causeway paid for by Congested Districts Board grant about 1903.

183 184 185 186

Problems of communication are not, however, solved merely by providing better roads: at least one household in four has a car or van, and this, with the fall in population, has caused a fatal decline in the use of public transport. The Bernera 'bus service was discontinued in August, 1959, for lack of demand. This is not, of course, an isolated example; the problem is common to all the Highlands, and indeed, to all the rural areas of Britain: in Sutherland, for example, the number of registrations of private cars has risen to very nearly 250% since 1945, and the total number of registrations for all classes of vehicles up to 1938 had risen to almost 200%, while the number of hackney carriages, after reaching a peak in 1952, has since declined by 70%.

DISTRICT TOTAL	13.1	13.9	183	188	196	201	1:15.0

Note: in this table, "working units" include all crofts, whether stocked or not, and all other agricultural holdings. Two or more crofts worked together, whether registered under the same tenant or not, are counted as single working units. An agricultural holding is defined as one with at least one cow, or five sheep, or half an acre of cultivation.

Crofts and Commons

423 A crofting area normally consists of the croft land proper - the inbye (arable and
427 unimproved land, and various common grazings. Table 20 summarises the situation in
311 Bernera. Kirkibost has by far the largest inbye and the Bernera Island townships generally
632 are larger than those of Bernera Shore. That the positions are reversed with regard to
common grazings is due to the limited hill of Croir and the very extensive hill of Linshader.
The Bernera Island township would, however, be much worse off for hill land had they
not various special common grazings (except Croir) and did they not share in the 4,341
acres of the Bernera shielings on the mainland. It is possible to calculate the appropriate
shieling share for each township on the basis that, though the theoretical soums for each
township and common grazing are exact, in fact all working units may send animals to the

423 shielings, and that therefore the shieling area per township is in proportion to the number
427 of working units in that township (total, 88 working units on the island). If these shares
311 are deducted it will be seen that only Kirkibost and Tobson common grazings exceed in
632 area those of Lundale, the smallest of the Bernera Shore grazings, and that even this is
no longer so if the special grazings, mainly later enlargements, are further deducted.
All this serves to emphasise the relative crowding on Bernera Island and the consequent
vital importance to most working units of the shielings. This has probably increased in
the last decade with the construction of the bridge, for whereas previously there was a
biannual ferrying operation to the mainland, tedious, unpleasant, and exhausting for both
beast and man, nowadays droving to the hills is an easy matter.

A somewhat different picture emerges when land is related to tenants and working units (table 21). If the inbye per croft tenant is calculated it is seen that Croir has the largest, (29 acres), rivalled only by Lundale, (26 acres), Hacklete, Kirkibost, Earshader, and Crulivig form an intermediate group (11 to 16 acres), while Breaclete, Tobson and Linshader have but eight acres or less. However, the average area of inbye is more revealing if calculated in relation to working units: then the Bernera Island townships are seen to range from 7 acres (Breaclete) to 33 (Croir) while only Lundale has more than 20 acres, the others having 14 or less. For the whole island the average of inbye per tenant (13.2 acres) is close to that for the Shore (12.8 acres) and the inbye per working unit (13.5 acres: 13.3 acres) is almost identical. Thus, there is considerable variation in the amount of inbye land available per tenant and the amalgamation of tenancies into working units does not seriously change this distribution.

None of the Bernera island townships has as much common grazing per tenant, nor per working unit, as any of the Bernera Shore townships, (little more than 100 acres as opposed to never less than 160 acres). The Bernera Shore townships as a group have about five times more pasture per tenant and per working unit than those of Bernera Island. Breaclete stands out as the township with the greatest shortage of land.

The various forms of subdivision and amalgamation of crofts and parts of crofts, or other holdings, are summarised in Table 22. In the small townships of Bernera Shore only Earshader, with four crofters, has non-crofting holdings with stock; there is little amalgamation. In Bernera Island, however, only Hacklete has the same number of working units as of registered croft holders and Breaclete, the township with the greatest shortage of land, is also the township with the greatest degree of unofficial change and intromission. In contrast, Tobson, in spite of its unconsolidated plan, presents a simple picture. Breaclete also has the largest number of feus, including the only feus not
568 functioning as agricultural units. This emphasises its function as a centre for the island.
It has both manses, both churches, the War Memorial, the school and the District Nurse.

108 These changes must however be seen in perspective. The Bernera region has not
427 suffered from the type of amalgamation which is the result of decay and which facilitates
further decay; the actual change is not very great. The number of agricultural working units is 98% of the number of crofter-tenants. It is illuminating to compare the region with Sutherland, where many former crofts, quite abandoned to rough pasture, have been taken off the rentals. Apart from changes due to clearances, the Bernera region has none of either type. Of 575 holdings examined in thirty-one townships in Sutherland, amalgamation has reduced the number of effective crofting units to only 437, i.e. 76% of the formal figure. Amalgamations by family co-operation are comparatively few in Sutherland (26 out of 173 known examples) whereas subletting is common. A further brief example may be taken from one of the Shetland islands where amalgamation has reduced the original number of holdings from something like 350 to about 250 working units.

423 Stock - potential and actual.*

427 The croft is in almost every case primarily a stock raising unit and cultivation apart
from certain items - particularly potatoes for domestic use - is connected with stock
231 rearing. The basis of the stock system is the soum, the share of the common pastures
311 in terms of horses, cattle and sheep. The largest total soums (more than two hundred
cow-units) are held by Hacklete, Kirkibost and Tobson; all the other townships have a
632 hundred or less cow-units (Table 24). This has some relation to the size of common
grazing. The very large area of Linshader is that of the former farm: the present

* Details of actual stock and souming for each township will be found in Appendix A.

231 soum is less than the capacity of the grazing and represents the Land Court's estimate
423 of the stock the crofters would be able to keep: the consequent discrepancy and retro-
427 gression in total stocking is a typical result of the replacement of commercial farms by
crofting subjects (c.f. page 25 above). It is better however to consider the area of
311 common grazing and soum combined: in fact, the average acreage per cow-unit is fairly
632 uniform for Bernera island, (8.7 acres). Bernera Shore has a wider variation of from
11.6 to 100.9 acres per cow-unit: obviously, either the Bernera island townships grazings,
particularly Bernera shielings, were originally estimated as of superior value, or, for
whatever cause, the common grazings of Bernera Shore are relatively under-used. How
is this reflected in practice?

TABLE 25

CROFTS:

CROFTS:

Figure 23
/facing p. 46/

241/198 The area under cultivation has contracted in the past twenty years. Before 1939 most crofts had about twice as much land under cultivation and at Valtos some were cultivating small patches outside the township fence. The cultivation of the common machair at Cliff ceased in 1939. The land had been "too long in labour" (potatoes had been planted on the same ground for nearly one hundred years), and the soil had been affected by over-liberal applications of sulphate of ammonia which replaced the traditional soot-impregnated thatch from the black-houses. Moreover the Cliff machair was particularly vulnerable to "blow outs" after ploughing. Cultivation of the Kneep common arable has all but ceased, and the fifty-two acres of arable machair in the township of Reef have been untouched since the 1930s. It is noticeable that the common machair cultivation and the shieling economy [231] ended about the same time. Smaller numbers of better-quality cattle were needed to meet the daily milk requirements of the croft; a much smaller area of cultivation was therefore needed to provide winter fodder and consequently more land was available on the croft for potato cultivation. Consequently the more distant machair was replaced by cultivation within the croft.

433/178 Contraction and decline of the economy is common to all three townships, but the form and cause of this decline is different for each, and where the township consists of two separate settlement nuclei there is frequently a difference between the two parts:

632/427/361/311 The township of Valtos is in two distinct parts: crofts 1 - 34 are a succession of narrow strips about ½ mile in length stretching from the shore to about 200' O.D.. The boundaries of the outer crofts (nos. 1 and 34) if projected to a point on Pabay, form an angle of 45°, so that the crofts are narrower at the shore (40 - 70') than at the upper limit (100 - 180'). Of these 34 crofts, 19 are in so-called runrig, eight in pairs and one group of three. (Fig. 2 Cultivation is carried out on numerous intermixed small patches, held permanently; the grazings are interchanged at the year end. Fragmentation imposes a severe limitation on the economic efficiency of the croft. None of the crofts at Valtos is individually fenced [241] though some groups of two or three are fenced together. With the contraction of cultivation only the less steep areas are cultivated, to facilitate ploughing.[1] As a result, the bulk of the cultivated plots are to be found at either end of the croft - near the shore and on the hill top against the township fence.

The remaining five crofts of Valtos, and a squatter, are at Cliff in the valley separating the Valtos peninsula from that of Aird. Here the crofts are fenced, more compact and slightly larger (4.8 acres as against 3.8 acres) and they occupy more level terrain than [241] those in Valtos. Two of the crofts are worked in runrig - these being situated on the machair. The houses are set back about a hundred yards from the road, along the western township fence.

Kneep township is again in two parts: Crofts 16 - 18 together with the Manse and two cottars, are situated across the neck of the Glebe promontory, on the south side of the peninsula. The five legal crofts are today worked as three units, fenced, reasonably compact and with holdings of exceptional size for the area - average 15.1 acres. Crofts [233] 1 - 15 at Kneep on the northern side of the peninsula adjoin those of Valtos. Here is a climax of land fragmentation, which imposes severe limits upon croft efficiency. Twelve of the fifteen crofts are worked; of these only numbers 4 and 5 are compact homogenous crofts; numbers 3 and 6 are compact except that part of the land which lies within their boundaries belongs to croft no. 13. The remaining eight crofts comprise a hundred and eight separate plots of croftland and fifty-two separate plots on the common machair. One croft with 2.8 acres arable the average size of each piece is a mere 0.15 acres! [233] The grazing land on the croft is divided into strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into

1. Pre-1939 much of Valtos was cultivated in lazy beds - by spade. Today 9% is cultivated by spade; 43% by horse plough + 48% by tractor.

strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into interchangeable sections ("quarters") to accommodate each of the groups of crofts. See Figures 22 and 23.

The cultivable croftland at Kneep is relatively flat and the natural drainage is poorly developed; the quality of this land, depends to a very great extent on the upkeep of a dyke running across the croftland from a small marshy loch to the sea. This dyke has not been cleaned for several years, and as a result a large area has been invaded by reeds. Other parts of the croftland have been similarly overrun by 'wild rhubarb'. Such deterioration is almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the edge of the machair have probably never been occupied since the crofts were allotted in 1921 and are now used only for grazing. The main body of the crofts (nos. 3 - 13) face south - they are more compact than those in Valtos and Reef, but they vary in size from 2.9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 15) are separated from the main parts of Reef: they are both small (2.5 acres) but the size is compensated by their situation on the level terrain of the machair. The old farm house is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the machair crofts, is on lazy beds - but many of these have decayed with the advent of horse and tractor ploughing; 35% of the land is cultivated by spade, and the remainder by horse plough.

The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen crofts are occupied and of these five are worked by disabled crofters or crofters over sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan Islands, fifteen miles west of Uig.

Fig. 24 shows the age/sex structure of the population in the three townships. It tells a story familiar to crofting townships: 55% of the resident population are over forty-five years of age; 9% of the total population are permanently away; and since 1939 the population has declined by at least 15% as the result of emigration alone. But perhaps the most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

By their very position, the townships of the Valtos peninsula are isolated. Fifty years ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep was built originally to bring the mails from the pier at Meavaig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at Valtos and Kneep, and at Meavaig which serves Reef, Uigean and Cliff. These are supplemented by travelling shops which call once per week, by Indian dealers and by the local 'bus-driver who makes purchases in Stornoway on behalf of customers on the peninsula. The school for the whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

368 ground. Some of these provide for a much larger area and indeed the policeman serves the whole of the parish of Uig. Three buses per day in each direction operating on a circular route provide transport to Stornoway.

UPPER CARLOWAY

● 427 133 The township comprises 51 registered crofts and 28 feus and allotments which are situated on the drift covered slope which rises from the head of Loch Carloway. The crofts are each about half a mile in length and from 5 to 25 yards in width aligned up and downslope. The lowest portion of the croftland is just above sea level and the highest approaches 225 feet O.D. The key crofts are numbers 30 and 31 whose boundaries come to a point thus enabling the crofts to be accommodated on the arcuate hill face. In the east are the crofts of Park Carloway which were lotted at a later date than the main area of croftland (numbers 1 to 40).

Only two crofts are fragmented ('fixed runrig'), these occupy lowlying hummocky land near the river where fencing would be difficult. Elsewhere fencing has been almost completed between the roads, but above the upper road fencing is less common, usually only being undertaken by the more enterprising crofters with more promising land; the bare rock surface of crofts 9 and 10 precludes any such attempt there. Almost all the fencing has taken place since 1946.

427 311 The 51 crofts and 28 feus and allotments are operated in 56 working agricultural units. The total land reputed arable 134.4 acres and the outrun 82.65 acres which gives a total of 217.05 acres of individually held ('croft') land. The method of working is controlled by the relationship of slope, soil and elevation. Three zones may be distinguished, namely

(1) Below the road;
   a) well drained and fairly accessible,
   b) poorly drained and often far from the croft house
(2) Between the roads: a main zone of cultivation
(3) Above the main road an upper zone
   a) with bare rock and thin soil
   b) drift covered - similar in character to (2), but more exposed

Crofts 1 - 32 occupy all three zones
" 33 - 40 and 46 occupy zones (2) and (3)
" 49 is in zone (2)
" 41 and 42 are in zone (1)a and are in 'fixed runrig'.

241 [40] In nearly all parts of these zones it is possible to use a tractor and so the cultivation of oats and cutting of hay is accomplished. It is usual to work the potatoes by horse, but only one man preferred to do all his ploughing by horse. This widespread use of the tractor is in marked contrast to the townships southeast of the Loch where it is almost impossible to use the tractor in many places. The significance of this in the contrasts in methods and efficiency need hardly be emphasised.

461 Life in a crofting township is governed by a very distinctive pattern of working that is so strong that it even influences the operations of the mills in Stornoway, for each crofter, if he continues to work his croft fully, must take time off for the communal operations such as the shearing or dipping of the sheep and inevitably at certain times of the year he will be anxious to work the croft. The table attempts to set out the pattern of the agricultural year in this group of townships (Figure 40).

241 Oats are the main fodder crop and although the practice of unders
it is increasing with the incentive of cultivation grants. Potatoes ar
crop, the main crop being Kerr's Pink and the 'earlies' several varie
gardens, common to nearly all the crofts, grow cabbages and carrots
succeed occasionally and there were many reports of poor yields. T
grown sugar beet successfully for fodder but did not see much future

CARLOWAY PARK

361 ● 427 In contrast with the excessive elongation of the crofts in Upper Carlo
Park Carloway form compact blocks. Another unusual feature is that
were lotted five field drains per croft were laid at a depth of eighteen in
have something to do with the good quality of the land. Nineteen acres
worked in five effective units that form a distinct block of cultivation.

* In 1960 and 1962 172 acres of common pasture were reseeded.

361 is attached to the Free Church Manse, is sublet to two feuars and is used entirely for
427 hay. One remarkably well stocked croft has one horse, two cows in milk, one calf and a heifer together with a sheep stock of twenty breeding ewes, twenty lambs and twenty other sheep (this was the first 100% lambing for many years). Labour is provided by one full time crofter with assistance from two others one of whom is a weaver. On another croft an elderly lady was preparing to make an application for a cultivation grant.

241 The intensity of cultivation may be attributed to two factors; first the sheltered position of the land, the moderate slope and good drainage and second to the energy and enterprise of the crofters.

BORROWSTON

361 Borrowston exhibits many of the characteristics that have been noted in Upper Carloway
427 and which are common on the north west of Loch Carloway. It consists of sixteen registered crofts and there are no feus. The crofts were lotted in narrow strips which rise steeply from the western shore of Loch Carloway to a head dyke at about 200 feet O.D. The drift cover thins as the ground rises until an upper zone with exposures of bare rock is reached. The result is that most of the cultivation takes place below the road which passes through the croft land and along which the settlement is located. All the crofts are fenced below the road, but are only partly fenced above it, presenting a pattern similar to that at Upper Carloway. Because of the steepness of the crofts the only way that the tractor can gain access to the land is by way of the lower road which passes from the bridge to the pier.

241 Fifty four acres of croftland are worked in fourteen operative units on which the oats are cultivated by tractor and the potatoes by spade. Though all the crofts have immediate access to the shore none are fertilised with seaweed at the present time; following the common practice in the area artificial fertilisers are used to supplement lime and manure
233 from the byres. None of the crofts are open for common grazing in the winter; this is because of the use of the old farm of Laimshader, granted to the township as an enlargement. The former arable land is now used as additional common pasture. The normal practice is to use the former farm land in conjunction with the croft land in the summer, the cattle being maintained on Laimshader as late in the season as is possible.

241 Borrowston is intensively cultivated, presenting a prosperous picture when viewed from the opposite shore of the loch, but in spite of its apparent prosperity the majority
[162] of the population is over 45 years of age. Herein lies one of the main causes of concern in this part of Uig parish, for though Carloway is in many ways more prosperous than is
181 south Uig and has a larger and more active population working in much more favourable conditions, the population is an aging one that has not the potential for maintaining a
[162] level of replacement. In Borrowston eight of the crofters depend on weaving, four are full-time crofters and seven of the twelve are over sixty five. Yet these men are active and maintain large sheep stocks, ten of the twelve exceeding their souming though only one of them has an excess of cattle.

Figure 40[1] has been drawn to illustrate the land use on particular crofts in this
233 northwestern area; one is in Borrowston and one is in Upper Carloway. The stock data
427 have also been added to give the complete picture of the agricultural unit. Each croft though prosperous, has an elderly tenant.

GARENIN

361
427 The township of Garenin, whose main area of croftland is situated a little apart from

[TEXT CONTINUED ON PAGE 107]

427

There is no bull in Garynahine; the Department of Agriculture bull from Callanish is borrowed. Most crofters buy their milk either from the Admiral at the Lodge or from Stornoway whence a dairy delivers daily.

Eight crofters keep sheep; stocks vary between 5 and 30 per holding. Two crofters exceed their soumingf (there is no equivalence in Garynahine because there has always been plenty of pasture). With a total of only 166 sheep and lambs on 1800 acres common pasture there is no danger of over-grazing.

The village has a good piped water supply from Loch Mhurchaidh, and has had electricity since 1954. There are excellent communications: 4 buses a day to Stornoway and also one bus from Uig and one from Bernera passing through Garynahine. These good communications have probably contributed to the declining interest in crofting.

There are only three full-time crofters (two of whom draw war pensions). Of the remaining 12 adult men permanently resident, 10 have regular or part time work, the remaining two being to old. Employment is either in Stornoway or at the Lodge. Only two people do part time weaving. Crofting is rapidly decaying in Garynahine. The croft land is reverting to rough grazing, and there is no indication of renewed interest in the land. Instead, life is becoming increasingly orientated towards Stornoway.

CALLANISH by Anne Iredale and Jennifer Oxenbury

Callanish must be one of the original settlement sites of the Hebrides, as it boasts an impressive standing stone circle and two other groups of stones. The stone circle is on a promontory, which projects into East Loch Roag. The promontory rises to about 125 ft, and then the land drops almost to sea-level at the neck (less than half a mile wide) which joins the promontory to the mainland. The township extends inland for about six miles in a belt roughly two miles wide. This inland area forms the common grazing; it is rough hummocky moorland with the general height rising gradually inland; the highest point is 425 ft.

The early crofts were situated close to the stone circle overlooking the Loch. The area was given to crofters who had been cleared from Linshader in the eighteenth century, and it is said that until the Crofter's Act the Callanish crofters had to return to Linshader to work for one day a year in return for this grant of land. But later the crofts on the more exposed westward facing side of the promontory were cleared and replaced by the 90 acre Callanish Farm. Some ruins of the croft houses still remain. The crofts then spread across the low lying neck to the main road from Stornoway to Breasclete, which now forms the boundary between the croftland and the common pasture. The croftland varies in quality, but it is mainly quite good potential arable. Fertilizer and manure are extensively used. Seaweed was widely used in the past but in more recent years the labour of gathering the seaweed has been out-balanced by the lower price of the artificial fertiliser. The main problem of the crofters is one of drainage, and in some parts the drainage channels have to be as wide as the strips of cultivation. Croft 29, situated on a small peninsula from the neck of low lying land, is almost cut off from the mainland at high tide.

The croft houses were then in two nuclei; one on each side of the narrow neck. Much later a third nuclei developed, known as Callanish New Park, further north along the Stornoway road, formed by evicted crofters from Bernera; they had put to sea in small boats with their belongings, and they happened to land at this point. They first became squatters on the common grazing but later gained crofter status.

There are 47 crofts in Callanish which vary in size from 2 acres to 9.7 acres. Some of the larger crofts are a result of private enterprise; the crofters have, without any

[TEXT CONTINUED ON PAGE 89]

Figure 34

Land-use in four typical crofts in Callanish. Notice that each croft is in t
separated by the road.

427 311 authority, simply moved their fences and enclosed part of the common grazing. For example the crofter at 37, instead of having only the 6.7 acres of the croft has now almost 10 acres of land, of which the remaining 3 acres have been 'acquired' by enclosing part of 195 the adjacent common pasture. Some of the crofts are in two or three pieces, and in some 311 cases this came about in the late nineteenth century when the proprietor's wife, Lady Matheson objected to the position of some of the croft houses because they were too close 427 to the standing stones. Croft houses 25 and 26, then near the stones, were moved to the other side of the village and given parts of crofts 1 and 2 for their houses. Crofts 1 and 2 were given parts of crofts 25 and 26 as compensation for the parts of their crofts they had lost. Croft 27 also lost part of its croftland close to the stones so that an enclosure could be made around the stones. About the same period, before the passing of the Crofter's Act (1886), when the village was still 'ruled' by the township constable, and several other changes took place. Croft 27 and 28 used to be where the croft houses are at present and the surrounding adjacent area only; but it is said that the tenants of these two houses, being influential with the constable, obtained part of Callanish Farm. Similarly the tenants of crofts 30, 31 and 35 divided part of croft 19; these changes have become permanent. The most recently formed croft was taken from the common pasture in 1890. Since then three feus have been created, but two of these are holiday houses and the third has only 0.5 acres of land.

241 There are 36 working croft units with a total of 134.4 acres reputed arable. All but 4 croft units grow oats, and there are 20 acres under oats (appendix C). Of the remaining cultivated land 9 acres are potatoes and 5 acres sown hay. Most of the land is cultivated by tractor; there are 6 tractors in the township. In the past there were several horses but now there is only one. Five crofters still cultivate by spade. The crops are sown in April, and the hay is usually harvested in August and the oats a month later according to the weather.

231 Thirty-one cows, six heifers and 25 calves are kept in the township and tethered most of the year on the crofts. It is usual for the crofters without a cow to graze one of their neighbour's cows for part of the year in exchange for milk. There is a beef-type shorthorn bull belonging to the Department of Agriculture, which is kept on Callanish Farm.

233 The 5,302 acres of common pasture support an individually owned stock of 904 sheep 311 and 561 lambs. Several crofters exceed their souming, but there is no shortage of grazing. Some of the sheep graze on Garynahine township pasture. Callanish also has the use of the pasture on Orasay island; each year some of the sheep (one sheep or ram 221 per croft) are taken across by boat for a period. The breeding ewes are brought in for 233 tupping on November 14th, after the harvest is complete, and lambing takes place in April. The crofters open their gates for winter grazing from November 1st to May 10th; in addition Callanish Farm (which has no sheep) is open for winter grazing. The sheep are sheared in July, and the lambs are taken from the ewes a month later. The lambs are dipped in November and the other sheep in December. Shielings at Flodavat are known to have been in use until 1921.

491 Communications are quite good; the village is close to a main road to Stornoway, and 131 there are four buses a day. But within the village itself many of the so-called roads are merely rough tracks, and one croft, number 29, is inaccessible by motor vehicle; it is [494] over a mile from the nearest track, separated from it by rough peat land. This year a grant from the council was made towards the cost of construction of a road to this croft; but several of the Callanish crofters who cut peat on the intervening land refused to allow a road to be built; and so croft 29 is still almost cut off from the rest of the village. 131 There are two shops in Callanish (one with a petrol pump); grocery, butchers' and fish [366] vans deliver frequently. Callanish also has a stone jetty which in the past was important. There was a ferry for mail and passengers from here across to Uig and Bernera calling [504] at Linshader, which gradually declined in importance until the 1920s when it ceased to call at Linshader. The ferry to Bernera finally ceased in 1940 when the ferryman (who [505] lived at Callanish Farm) left for war service. After this the jetty was still used by small private boats (e.g. Callanish church serves Linshader, and many people came to church by boat until recently), but gradually it has fallen into disuse.

312 There is no piped water supply and after even a short period of dry weather there is a 504 water shortage. One prosperous crofter (where the crofter does weaving and one member of the family is periodically away with a Norwegian whaling fleet) bought a large modern Bendix electric washer only to find that there was not sufficient water to use it except on [354] rare occasions. The croft houses have had electricity since 1954, and even the three remaining inhabited thatched houses now have electricity.

311 Although there are only 4 full-time crofters, most of the crofts are carefully and well worked. Only a few crofts are decaying, and there is a tendency for these to be sub-let to the more agriculturally inclined crofters instead of allowing the land to revert. In [288] addition to the full-time crofters, 31 other men do part-time crofting. Eighteen men weave and this provides their main income, but this figure fluctuates according to the prosperity of the Harris Tweed industry; at present the figure is probably higher than [166] average. Although 32 people have emigrated from the township since 1939 (many of them [161] young people who have married on the mainland), there are still several young people and young families making their homes here. The dominant age-group of permanently resi- [162] dent adults is 15 to 44. Total population is steadily declining, but Callanish has always been a prosperous area and seems likely to remain among the more prosperous crofting communities.

BREASCLETE PARK by Margaret Grice and Doreen J. Phillips.

195 Breasclete Park, also known as New Park, Callanish, was settled by people cleared from Reef in the mid 19th century. Two of the six original crofts have been subdivided, 427 making nine. However, there are only five working units and on one there is no cultivation. There is also a feu house built in 1958.

361 The crofts, which are fenced, form broad strips perpendicular to the Breasclete-Callanish road. Cultivation is mainly by tractor, oats, potatoes and some clover being 241 grown. One progressive crofter has successfully experimented with re-seeding one acre of grazing land on his own croft. Common pasture for the 148 sheep and 6 cattle 231 is shared with Callanish, and for most purposes the Park can be considered a part of that township.

162 The total population is 26 of which 4 are permanently away. There are 6 people over 65, and 8 children under 15.

BREASCLETE by Margaret Grice and Doreen J. Phillips.

131 Breasclete is situated on the east side of East Loch Roag on land which rises gently from the seashore to the moorland and is interrupted by rocky outcrops of gneiss in the 133 northern part. It is separated from the township of Callanish to the south, by a small westerly flowing stream, at the mouth of which is the site of a mill.

491 The road on which most of the houses are situated, follows a curve through the middle of the crofts, but newer houses and some feus have been built along the main 361 Callanish-Cartoway road, nearer to the shore. Stornoway is 18 miles away along this road which is turned throughout. Breasclete could be served by the still unfinished Pentland Road, were it to be properly surfaced and this would make the journey shorter [494] by 4 miles. Two buses in each direction per day connect the township to Stornoway, but high fares make visits to the town infrequent.

312 The township hopes to receive the mains water supply within the next few years, but, at the moment, relies on wells within easy access of most of the houses. Many houses have piped water from private wells, some of which go dry after two or three days good weather although the wells on the lower ground never fail.

361/ at Carloway Bridge. In addition to the main settlement which is irregularly disposed on either side of the two roads, a group of Swedish timber Council houses has been built in a somewhat forbidding situation on the common pasture adjoining the 'Pentland' road.

427 The thirty three registered crofts and thirteen feus or allotments (of which only five
311 are non-agricultural) are worked in thirty four units. Three of the tenants of the Swedish houses have crofts, two in Knock Carloway and one in Upper Carloway.

311 The land use figures show that Knock Carloway has a much greater percentage of permanent grass than has Borrowston on the opposite shore of the loch. These figures reflect not only the less rewarding physical environment on the south shore, but also the lower intensity of cultivation which bears a direct relationship to the type, number and quality of the stock. The township has less than the total number of animals permitted by the souming though the higher figure for sheep than cattle reflects the general trend for the area. No horses are kept but the township has the bull which serves the area - a privately owned beef-shorthorn.

464 Weaving remains the major occupation but the emphasis is less heavy than in the other
286 townships for the community services centred here employ a number of the inhabitants.
632 It may be that here lies part of the answer to the problems of the community as a whole: but even if employment in services were to be increased it could never be very significant in a district with a total population of only 600.

KIRIVICK

34 Adjoining Knock Carloway is the small township of Kirivick which has forty one per-
162 manent residents. It occupies the least rewarding agricultural environment of the area.
133 Crofts 1 to 13 rise from the shore of Loch Carloway on the broken hill face to the Carloway-Breasclete road, whilst number 14 occupies the head of a small valley which was once part of the common pasture beyond the road.

361 The houses are set back from the road occasionally sheltering in the lee of the frequent
133 knolls of bare rock which are exposed on the croft land. These rock surfaces together with the irregular deposition of the drift account for the fragmentation of the cultivated strips in small hand-dug lazy beds on the upper parts of the crofts inaccessible to the tractor.

361 There are fourteen crofts, three feus and one squatter settlement and all but two of
427 these are fenced. Two of the crofts are held in 'fixed runrig' and the small sections in
311 which the land is cultivated are shown in figure 41 ¾ which also illustrates the regular distribution of sections between the two. Though it used to be the normal practice the crofts are not now open to common grazing in the winter.

311 The restricted amount of land available for common grazing ensured the continued use of the shielings until 1939; small patches were cultivated on the common grazing about forty years ago and this fact too is the only recorded instance of a practice that was a community by the size of the working unit and the land available. At the moment there is no proposal for reseeding of any part of the common pasture* because of the difficulty of getting access for tractors. As in the case of Knock Carloway the total souming is not exceeded, but the sheep stock is 25% above the sheep soum.

162 The population figures emphasise the problem of the whole of this southern area and here is the most extreme case of incipient decline. There are two fulltime crofters, six crofters who weave and five crofters over sixty five. Seventy per cent of the population is over 45 and only two children attend the school neither of whom is likely to take up crofting.

1. [Figure 42--Analyst]

DUN CARLOWAY

361 Dun Carloway though clearly of a similar type to the other townships south of Loch
Carloway has certain features peculiar to itself. The croft land may be divided into
427 two sections; crofts 18 to 23 occupy the deep trench which extends from the Dun Carloway
school to Loch Carloway itself. These holdings are larger than the average discussed
above and are divided in broad rectangular block. To the west there is a less deeply
entrenched zone where the crofts are long and narrow lying up and down slope like those
241 of Borrowston. Short steep and narrow lazy beds characterise the cultivation which
follows the pattern set in the other townships, although the areas, as has been noted
above, are much larger in some cases; the largest have up to twenty acres. Despite
this increased size no croft has more than two acres of oats. The low percentage of
land under cultivation is only in part explained by the difficult nature of the ground and
461 the limited use which can be made of the tractor. Few crofters are willing to attempt
more cultivation (to provide extra feed for store cattle or some other form of stock
[288] enterprise) so long as the income from weaving is satisfactory. The concept of the
croft as an ancilliary employment appears to have defeated its own object, for with the
population at its present level, and with the income from weaving as it is, very few
crofters are prepared to do more than provide milk for the family, (with the annual cow
and calf subsidies, and the proceeds of the sale of the annual calf as by-products) and to
derive what income Providence rather than goodmanagement may allow from the sheep.

427 The total area of individually held croftland is 194 acres which is worked in twenty
five agricultural units derived from twenty six crofts, nine feus, one 'free gift' holding
311 and one squatter. The cultivation is accomplished by one horse and one tractor, each
fo which is owned within the township.

The total souming is exceeded, the main reason for this being the gross overstocking
311 of sheep; 187.4% of the soum. This overstocking cannot fail to have a harmful effect
on the common pasture, promoting an increase in the bracken already visible on some
of the croftland itself, under-nourishment and disease. The poor quality of the hill
pasture is brought home by a comparison with the grazings of North Uist where the most
striking feature of the landscape is its greenness after the heavier browns of Western
Lewis. Regeneration by surface seeding would certainly be helpful here.

SUMMARY AND CONCLUSIONS

128 The tables given in appendices C and D form the basis for much of the comment in the
preceding pages. They must now be considered in the light of the general tendencies
which they illustrate in the changing livestock economy units.

241 Appendix C(1) elucidates the working of the crofts. The picture is somewhat com-
311 plicated by the large number of non-crofting holdings in the area, of which 43 carry
stock (a quarter of these sublet croftland). The number of feus also tends to mask the
231 process of amalgamation of crofts to form larger working units; a process which has
473 been taking place for some time. There are in this connection one or two cases of the
427 cross working of crofts between individuals in neighbouring townships. The figures for
these units have been included with those of the township where the tenant is resident.

241 Oats are the most important arable crop. The acreages of sown grass for hay and
pasture are much lower in comparison. Permanent grass, mostly old arable land, is
to be found on 52% of the total area of land occupied as crofts and feus. A large propor-
tion of this is on very thin soil where bare rock is exposed and on wet land, but even so
it does show that much more of the land might be under cultivation or improved grass.
[148] The decrease in cultivation since the late nineteenth century is probably much less than
that for the Valtos area of South Uig where about 70% of the inbye and outrun is under

23 31 32 Hacklete, Kirkibost and Tobson have by far the largest total holdings of stock but are eclipsed in regard to percentage of soum actually held by Breaclete, Croir, and all the Bernera Shore townships. In fact the average percentage soum held is 66% on the Island as against 114% on the Shore. If efficiency is interpreted in terms of stock rearing therefore, Tobson is less than 50% efficient, Hacklete and Kirkibost 50% to 75% Breaclete Linshader and Lundale 75 to 100%, and the rest 100% to 175% efficient, the average falling at 75%.

It is also interesting to remark the area of common grazing per cow-unit actually held. This shows that, in effect, the Bernera Island townships, as might be expected from their use of one main common grazing, have much the same amount of land per beast The Bernera Shore townships apparently need rather larger areas of land per cow-unit; the excessively large area shown for Linshader indicates understocking.

27 Figure 29 summarises the incidence of soums and actual stock carried. It will be seen that, although there are some crofts with soums of under five and over fifteen cow-units, the majority lie between those limits with a marked peak in the 7.5 to 10 cow-unit class. The largest soums tend to be under-utilised. Figure 28 shows the percentage of the soum held. Almost a quarter of the working units have less than 50% of their soum and must therefore be considered as inefficient in their chief function of stock raising, about one third have 50 - 100% and rather less than 1/3 have over 100%

The incidence from township to township varies (table 25) but generally the Bernera Shore townships have more uniform individual soums than the older and larger Island townships, though the range of size of stock holdings and consequently of soums held is more comparable. Table 25 shows the average soum per croft or working unit: Breaclete and Croir are similar with only just over half the average for the rest of Bernera Island. None of the Bernera Shore townships have soums as large as the bigger Island ones, and one of them, Earshader has no more than Breaclete or Croir. Kirkibost and Tobson stand out as far the most generously treated townships, but is this justified in practice?

Expressed in terms of cow units, (table 25) the total soums reveal that, on Bernera Island, only Croir is really efficient with just over 100% of its soum: Breaclete, Hacklete and Kirkbost are satisfactory - and no more - with 60 - 80%; but Tobson has only 45% of its soum. This is a very much poorer showing than that for the Bernera Shore townships, only one of which drops much below 100%. Therefore on the Shore the soums, though smaller, are better taken up than on the Island. Further it is clear that, of the individual working units on Bernera Island, none of those of Croir are unsatisfactory, three out of sixteen at Breaclete are not satisfactory, five out of twenty at Hacklete, eight out of twenty-eight at Kirkibost and eleven out of nineteen at Tobson, whereas on Bernera Shore there are only two unsatisfactory units - at Linshader - one of which is presently vacant with a dispute over the tenancy.

31 33 11 But so far, only the total soum has been considered: in fact it is necessary to consider the elements of that soum, for in order to maintain the pasture one must have a stock suitably balanced as between cattle and sheep. When the soums were originally calculated this was borne in mind and were every soum fully occupied in the proportions originally planned, the balance of grazing would presumably be satisfactory. Table 26 shows the stock equivalents in sheep units. In Croir the soum would indicate a marked preponderance of cattle +, in Linshader (with its extensive hill lands) of sheep; otherwise there is a rough balance in the soumings between large and small hooved beasts. 56 Occasionally there are special permissive or restrictive clauses in the regulations. For instance, on Breaclete township common grazing, "...a landholder...shall be entitled to graze thereon, free of charge, during summer and autumn, two hoggs for every pound sterling of rent, for replacing the cast ewes...". Similarly, in Linshader horses are not allowed on a fenced area of 800 acres, and on Little Bernera horses are specifically disallowed. But generally the various classes of stock have clear equivalents which are freely interchangeable. How does this work in practice?

---

7 + Editorial Note: this was probably because, when the Land Court determined the soum, Croir had no share in Bernera Sheilings. This now calls for adjustment, which should be made when the Crofters Commission re-enact the local Grazing Regulations.

000 weather although the wells on the lower ground never fail. Mains electricity was installed
354 7 years ago, but on the whole cooking is still done by Calor Gas and peat. The chief source of fuel for heating purposes is peat, alghough a little coal may be used.

427 There are 63 registered crofts, including many subdivisions, a small-holding of 15
[361] acres formerly the Mill, and 10 feus, all of which are worked as 54 units. The crofts lie as long narrow strips in a NE - SW direction from the moorland to the sea. All are at least partly fenced, the fencing being of recent date. Some crofters are, at the moment, making use of fencing grants to enclose their land completely.

241 The only crops grown are oats and potatoes, and although a little clover mixture is sown for hay, many crofters find that the natural grass is sufficient for their needs. Vegetables are produced in a few gardens, but most people do not have enough time or interest to bother with them. Flowers rarely flourish owing to the lack of shelter.

311 Far less of the croft is cultivated now than in the past, and the land nearest the shore,
[178] part of which was once cultivated on a run-rig system is now unfenced and used entirely for grazing together with some peat cutting. A piece of the common grazing has been improved by application of shell sand and chemical fertilizers and reseeded. This experiment in which almost the whole township took part has proved very successful and there are plans for further reseeding. Details of crops are given in Appendix C.

[46] Although the tractors of which there are two in the township are used wherever possible,
[231] the spade is still used on many small patches, particularly for potatoes. Much hay is cut by mower but scythes are used to a large extent. There is still one horse in the township but it is scarcely ever used for ploughing except by its owner.

233 The total number of sheep kept in the township is 1,500 i.e. 2½ times the souming
231 which here is 2 cows and 5 sheep per £1 sterling rent. 40 crofters keep sheep but none have sufficient to make a livelihood from sheep alone. Many lambs are lost on the moors during the summer and more fail to survive the winter. The number of cattle kept is 84, i.e. only 1/3 of that permitted. It is usual for each household to keep 1 cow and 1 calf which is generally sold after 6 months when a subsidy can be claimed. Breasclete has no bull, but shares the one from Callanish. Most households keep sufficient poultry for their needs but no eggs are marketed.

Shielings were still used to some extent up to 1938. Now it is not necessary as fewer cows are kept than formerly. With the reduction in numbers of stock the common pastures close to the village are being colonised by heather.

221 The crofters' year begins at the end of March when the ditches are cleaned and the
241 land is prepared. In April the ground is ploughed, fertilised and sown with oats and
233 potatoes. The sheep are dipped and by the 10th of May must be out on the moors as the
[314] crofts are then closed to common grazings. Soon after this peats are cut on the moors two or three miles from the village. After about 20 days the peats are lifted and carried to the Pentland Road by tractor where they are stacked to await the lorry which takes them to the village.

In June, the sheep are gathered into the fank for shearing and the cows are usually brought to graze on the crofts from the nearby moors. If the croft is not fenced they must be tethered. At the end of June the clover is cut, while the potatoes must be cleaned and hoed. In August the lambs are weaned and dipped. Natural grass is cut for hay and if there is any first year sown grass this may yield a second crop in September, together with the corn harvest. When the potatoes have been lifted in October the crofts are opened and the sheep are brought in for the winter. Final dipping takes place in November.

162 Out of a total resident population of 226, 56 are under 15 years and 57 are over 65
years of age. Of the resident tenants 9 are between 15 and 44 years, 19 are between 44 and 65 years and 26 are over 65 years of age. Twenty on persons are periodically
000 away e.g. students and seasonal workers and 29 are permanently away. Since 1939,

Since 1939,
166 54 people have emigrated whereas only 4 have immigrated. Most of the girls have to
462 leave home when they finish school as there is no employment locally. Many of them go into domestic service or nursing in Glasgow. Many of the younger men also spend time away from home, often in the Merchant Navy. Breasclete is also the temporary home of the families of lighthousemen on duty in the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides the main source of income. This is a rather irregular occupation owing to the uncertain demand for the tweed, and although the men are nominally self-employed they rely on the mills to supply them with work. The tweed is woven on treadle looms, which, with ancillary equipment such as bobbin winders, are all owned by the crofters.

[458] As 1959 was a good year for the tweed industry, there was an air of prosperity in the township, and with the aid of government housing grants many new bungalows were being erected. But should there be a slump, the crofts would be unable to support the population and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
133 a' Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs,
361 for westwards to the sea the terrain is too rocky and irregular for either settlement or cultivation, whilst to the east of Loch a' Bhaile the land slopes precipitously from 250 ft. to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle drift-covered slopes, generally of small extent.

137 Cultivation is very noticeably limited to three areas - along the west shore of Loch
[241] a' Bhaile, along the north-east shore of Loch Shader, and in the valley of the small stream draining from the north into the head of Loch a' Bhaile. Most of the croft land is composed of rock outcrops, rarely exceeding 100 ft. in height, separated by damp depressions frequently filled by reeds and rushes; bracken was apparent only on three crofts. In particular, the area between the two lochs is badly in need of draining and is largely colonised by reeds and very coarse grasses, of no use whatsoever as pasture. One enterprising person suggested that the township should hire a ditching machine - this could certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
311 2 holiday bungalows, with the croft holdings aligned north-east/south-west between the
• 427 two lochs and the sea, except for nos. 28 and 29. The 53 holdings are unofficially amalgamated in various ways and so reduced to 35 operative agricultural units. The acreage of crofts varies from 2.2 to 20.75 acres - a considerable variation. Fencing of the crofts - except for 1A, B, and C, and 12A, B, and C which are held 'run-rig' - was carried out between 1945 and 1950, whilst in 1946 the common pasture of 2,700 acres was fenced into two parks - an inner and an outer one, the division coinciding with the Carloway to Breasclete road. An area stretching from crofts 18A to 21 has, however, been most haphazardly divided. The seaward halves of some five crofts were redivided amongst seventeen crofts in the southern half of the township to compensate them for lack of grazing area within their own croft boundaries. This division is said to date from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
[160] small mechanical cultivators. Ploughing by tractor and horse, as opposed to spade cultivation, depends either on the urgency of the operation, or on the accessibility of the plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

427 241 Although the croftland is individually held, individual control of the crofts only applies for six months of the year. After the harvest, the croft land reverts to common grazing and the whole township stock graze indiscriminately over the crofts. Thus basically the whole area of the 221 township, the individually held crofts and the common pasture, is common land, and it is clear 423 that the agricultural revolution with its system of enclosure has not yet fully refashioned the Crofting 178 Area. 232

175 Before 1900, there was a third element in the crofting landscape, the shieling (Gaelic - 'airigh'). 233 The sites of the shielings are usually on slopes commanding a view of the surrounding area near a spring or stream and usually two to nine huts belonging to the same township are grouped together on a site; isolated shielings are rather rare. In order to conserve the pasture within the township dyke for wintering and to protect the unfenced crops, the cattle were removed to the hill early in June, and the younger members of the households went out to live in small stone or turf-walled huts to tend the cattle. The milk was either carried back to the township daily or made into butter or cheese at the shieling. The distance of shielings from the crofts varied from one to five miles in Park.

632 The affairs of the townships are managed by the Grazing Committee, elected triennially by the township and presided over by the Clerk of the Committee. The duties of the Committee in the past related mainly to the enforcement of soumings, but are now reduced to the disbursement of subsidies, although responsibility for the maintenance of the township dyke and the care of the township bull (usually lent by the Department of Agriculture but sometimes communally owned) are also the province of the Committee.

341 The layout of the townships varies with the topography but the majority of the crofts are aligned 342 in strips from the moor to the sea (figures 4 and 5). Most croft houses are built on the crofts; in 76 former times, the majority of the houses were sited on the poorest part of the croft as all the cultivable land was required for crops, but nowadays the houses tend to be sited near the road.

162 The official pattern of crofting is thus one of tenants, each living on his or her croft and sharing 561 in the rights and duties of the township. Table I gives an analysis of the tenants of the 215 Park 427 crofts. It will be noted that only one-fifth of the crofts are tenanted by those in the 15-44 age 241 group: a similar proportion are tenanted by those over 65 years of age. Absentee tenants account for 14 per cent of the total. Women form under 10 per cent of the total, but only one in seven of 464 the women tenants is the sole labour force on the croft. The intrinsic worth of the holdings can be inferred from the fact that two-thirds of the male tenants in the insurable age group take supplementary work, two-fifths of them furth of Lewis. With such a large proportion of the tenants either fully employed in ancillary occupations in Park or elsewhere it is hardly surprising that the theoretical township organization exists mainly in name alone.

427 Each croft, however, is not necessarily an agricultural unit; some are sublet by absentee 241 tenants or by tenants who are too old or too infirm to work their crofts. Of the 215 crofts, one-fifth are wholly or partly sublet. In addition to the legal crofts, there are unofficial holdings which fall into three categories, cottars, squatters and feuars, all legally without grazing rights. A cottar[1] is a person, usually a close relative of the tenant, who builds another house on

1 These are the de facto definitions. Section 34 of the Crofters' Act of 1886 defines a cottar as follows:- "Cottar" means the occupier of a dwelling-house situate in a crofting parish with or without land who pays no rent to the landlord, as also the tenant from year to year of a dwelling house situated in a crofting parish who resides therein, and who pays to the landlord therefor an annual rent not exceeding six pounds in money, whether with or without garden ground, but without 115 arable or pasture land". For fuller treatment, see Scott, J., "The Law of Smallholdings in Scotland," 1933, pages 152-155.

There is no legal definition of a squatter, and the above definition does not include any distinction between houses built on a croft and houses built on the Common Grazings.

427 a legal croft; a squatter builds a house on the common grazing, and a feuar pays a feu-duty or 241 ground-annual to the proprietor. Such unofficial holdings with stock on the common grazing are "agricultural units" in the same way as the crofts, for in fact some cottars keep more stock than the crofters. In these classes are 84 families and 32 of them keep stock. Thus instead of 215 legal units, there are 219 working units[1]. The more usual situation in depopulated crofting areas, where the number of agricultural units is much smaller than the number of crofts, is certainly not prevalent in Park. The official pattern of crofting and the real pattern are very different indeed both in Park and throughout the Crofting Area.

Crofting Agriculture

241 By definition, the function of crofting is agricultural production. The small area of cultivable 433 land, the poverty of the immature soils and the inhibiting characteristics of the climate, severely limit the range of crops. Of the 1838 acres of croft land in Park, less than 400 acres are classed as arable land. The measurement of the arable land was carried out about 1850 but reclamation after that date increased the arable area. Only in the townships of Shieldernish, Haboat, Kershader, (Figure 5), and Garyvard where there are deeper deposits of glacial drift, is ploughing practised; elsewhere cultivation is entirely in 'lazy-beds', a system of narrow ridges 4 to 6 feet in width, 246 separated by open drains, and cultivated by spade. Natural grass for hay is the chief crop, and and accounts for 52 per cent of the 638 acres of cropped land (See Table II). As only 400 acres of the croft land are classed as arable, some of this hay is taken from areas which were brought 244 into cultivation after 1850. Oats (26 per cent), occupy the largest cultivated area, followed by potatoes (13 per cent). The small area of sown grass (9 per cent) of which four fifths is cut for hay, is symptomatic of the low standard of husbandry: only one fifth of the agriculture units sow grass. The average cropped area per agricultural unit is only 3 acres and only one-third of the units have gardens in cultivation. The hay and oats are grown for winter fodder, and the potatoes for household use. No detailed conclusions as to the use made of the crofts for cropping can be drawn, as the potential of each croft is extremely variable, but the low proportion of sown grass is indicative of the husbandry. There is a clear distinction between the 'agricultural' townships (Seaforthhead, Shieldernish, Haboat, Kershader, Garyvard and Caversta), and the 'fishing' townships (Cromore, Marivig, Calbost, Gravir and Glengravir, Lemreway and Orinsay) in the extent and utilisation of the arable land: one measure of this distinction is that 55 per cent of the units in the agricultural townships sow grass, the figure for the fishing townships is only 22 per cent.

241 More valuable conclusions can however be reached from a study of the stocking. With the exception 427 of Glengravir township, each croft has a defined soum, and thus the stock entitlement for each 433 operative unit can be calculated. By using the equivalence, the soum can be converted to "cow units". In Gravir, the soum is 1 cow and follower, and 8 sheep per £1 rent: the equivalence is 1 cow to 5 sheep. The number of cow units per £1 rent is therefore 2.6; in the calculation, followers are ignored. The actual stock of the agricultural unit can also be converted to cow units and thus a comparison can be made between the soum and the actual stock of each unit. The percentage of the soum taken up can thus be used as an indication of the extent to which the unit is worked.

In the Crofting Area, as in all Highland Britain, stock rearing is the main function of agriculture. 434 In Park, all the agricultural income, subsidies for cropping excluded, is derived from cattle and sheep.

1 Of the 215 legal units, 28 are sublet: thus if there was no unofficial stock-keeping by cottars and squatters there would be 187 agricultural units. However, there are 32 additional stock-keepers and thus in fact there are 219 agricultural units.

434 The economy is neither a subsistence nor a self-sufficient economy for the majority. All but a few large crofters have to supplement their income from the croft with some form of outside employment or independent source of income, for ex-
427 361 ample, contributions from a child or a pension. For many the croft is no more than a home. For an aged person, it provides a means of living cheaply. The rent, which is fixed by law,
427 571 361 is only nominal, and the taxes are negligible. There is more to crofting than simple economic considerations. Indeed, if it were only a matter of economy, the system would have been
[554] abandoned long ago. It is a way of life in which the individual finds meaningful patterns of interaction and an ascribed status compatible with his aspirations. The land is more than a potential source of income. It is the ancestral home. The tie to the land is an expression of the sentimental bond of kinship.[12] Many, perhaps the majority, have spent a good part of their lives in other parts of the world working for a wage and looking forward to the day they might return to the Misty Isle. Although only the Glendale crofters are land owners, the law has given the tenants complete security of tenure and the right to bequeath the croft to a member of their family. Thus, they can return to their township and find solidarity.

[12]Cf. Ibid., pp. 64, 81.

the fourth degree of relationship. Although the extended 621 571 602 596
family is now rather amorphous compared to what it must have been a century or two ago, it is still very real to the Sgiathanach. Once, perhaps, the townships and their historic [591] [175]
antecedents were patrilocal settlements. Then, of course, the question of the availibility of land and the legality of subdivision were of small importance. Now the rigid system [591] of land use enforces neo-local post-marital residence, often [427]
at a great distance from the parents, and very often means that the younger generation must join the constant outward movement of the population. Thus, the extended family is seldom, if ever, found intact. Indeed, the only times its members come together as a group is at a funeral or a wedding. On these occasions the strong patrilineal emphasis becomes apparent, and the fact that the individual always remains a member of his or her family group is revealed. It is, then, a stem family.

In structure the extended family includes all males and 596 601
females out to, and including, third cousins. The kinship terminology is descriptive. Excepting grandchildren, all relatives are distinguished by sex and generation. Members of the parental generation and lineal descendents of the parents collateral kin are distinguished by their relationship to the individuals parents. Members of the grandparental and great-grandparental generations and their lineal descendents are similarly distinguished. The same descriptive technique extends to kinsmen of the first and second descending generations.

f the tacksmen. Here was the essence of the clan system, the 175* 602 614 618
ommon tie of territory and kinship. The land was not the mere
eans of subsistence, it was the ancestral home.

The clan was strongly patrilineal. The father of the
ndividual family stood to his children as the senior member
f the derbfine to his kinsmen, the tacksmen to his followers,
nd the chief to the body of the clan. The fundamental under-
ying principle was mutual, reciprocal devotion. The system
es equalitarian. Although the chief was the landowner, and
he tacksmen received their land on lease, for which they owed
he chief the duties of service and a rent just as their
enants owed the tacksmen, the land had no commercial value.
ent was an ill defined and secondary consideration. The dignity
f the clan depended on the number of supporters, who could
e maintained on the land under the system of land use.

175* 241 421 427

Economic Activities

The principles of land use and tenure on the Isle of Skye
p to the early years of the eighteenth century were similar to
hose prevailing all over Scotland.[59] The land was used under a
ystem of runrig agriculture. The word runrig appears to be a
odification of the Gaelic roinn-ruith, a parallel or running
ivision. The bulk of the population, as tenants of the land

Handley, Scottish Farming in the Eighteenth Century (London: Faber and Faber, Ltd., 1953), pp. 34-73, 91-100.

owning clan chief (or Lowland aristocrat) or subtenants of the 175* 241
leaseholders, was clustered into hamlet-like farming settlements 421
to exploit the arable, pasture, and grazing lands by individual 427
and cooperative effort. The land suitable for cultivation was
divided into infield and outfield. Since Ireland and Wales
continued to use shifting arable, and England adopted permanent
arable in the Middle Ages, the practice of dividing the land
into two separate allotments must have been introduced by the
Norse. Norway continues to use infield and outfield to the
present day.

The infield, about one third of the arable land, was
farmed continuously with the aid of manure. The outfield was
worked until exhausted and then left fallow while a new piece
was brought into cultivation. Both were split into "rigs,"
irregular strips about twenty feet wide and several hundred
feet long, separated by "balks," any uncultivated patch. Each
man had at least three rigs for his use. Annually, all ex-
changed at least one rig with the other holders by ballot.
Since all of the land was not of equal value, this periodic
redistribution gave each man an opportunity to have the use
of the best soil every three years. The use of the pasture
and grazing lands was regulated by a system of common rights.
The stock of each individual was proportionate to his share
in the arable land. When arbitration was needed to decide
questions of allotment, grazing rights, or rent, a "birley
court," composed of the share-holders and their elected
constacle, was held. Economically, each farm appears to have 175*

dynamic evangelical form of worship in preference to th
humanistic preaching of their own ministers.

Period II (1811-1845)

The year 1811 marks a turning point in the cultur
of the Isle of Skye. During the second period the proc
we have observed in the initial period gained strength
began to unfold in their characteristic forms. By this

the land into large commercial farms.[26] Even had the landlords desired to emulate the results achieved elsewhere, it is doubtful that the persistent demands of the steadily increasing numbers of people for a share in the land could have been disregarded at this time. On Skye, as in most of the Western Highlands, the arable of the old farms was simply divided into as many equal shares of five to ten acres as possible. The grazing lands continued to be held in common and used under a system of stinted rights, and the arable was used communally between harvesting and spring ploughing. Lacking any legally recognized traditional or written right to the land, the people remained tenants at will, enjoying hereditary tenure as long as they had the good will of the landlord and, especially, that of his factor.

The people, then, were each given a precisely equal share, which was often assigned by lot, in the old farms. Just as the old infield and outfield system had functioned to provide each man with a bit of the worst and a bit of the best soil, the shares were set out in long strips. After the former joint-tenants and subtenants received their fixed allotments, they moved their dwellings from the small hamlet-like clusters near the center of each farm to the individual plots. The township settlement patterns, as we now know it, came into existence.

The effects of this rather superficial reorganization

[26] Cf., e.g., Malcolm Gray, "The Abolition of Runrig in the Highlands of Scotland," pp. 52-53, 54; and Handley, Scottish Farming in the Eighteenth Century, pp. 190-202.

soon became apparent. There was a leveling of the social hierarchy. The former joint-tenants, subtenants, and cottars had become crofters. Whatever socio-economic distinctions had once marked the clansmen, all were now more or less equal in status. The cottars seem to have temporarily disappeared.[27] The proprietors were absent, and the tacksmen were almost gone. Indeed, the indignant withdrawal of the tacksmen had contributed to the circumstances which made the abolition of runrig possible.

Although the crofts were small and the rents were high, the people were able to satisfy most of their domestic needs by combining cultivation, stock breeding, and fishing. They could also make enough from the droving trade and, in certain areas, kelping to pay the rents and purchase grain. The crofts were considered more than adequate. Early marriage and subdivision of the crofts became common practice.[28] When a crofter's son married, he was allowed to take part of his father's land and build a house. The proprietors may have explicitly encouraged the practice of early marriage and subdivision. Those who could be gently proded into kelping or commercial fishing not only produced a valuable export but also paid for the privilege of working in the form of high rents. Within a generation three and four nuclear families were living on crofts originally intended for one. When subdivision was at last forbidden, about 1840, the crofter simply took his

CHAPTER TWELVE

AGRICULTURE IN A CROFTING PARISH

by

H. A. Moisley

The agricultural economy of Uig parish, as of the Hebrides in general, is rigidly controlled by three sets of factors - physical conditions, the system of crofting land tenure, and economic circumstances. The first two have already been discussed in Part I. In particular, it has been shown that the crofting system, as at present operated, puts many holdings into the hands of tenants who cannot make best use of the land. Many holdings stand under-stocked, some virtually un-used, whilst some crofters who could be efficient agents of agricultural production are inhibited by the small size of their holdings and their inability to sufficiently enlarge them. (See Chap. III, p. 30, and appendices to the district accounts, especially A(3), A(5), C(3) and C(5)).

The crofting system re-organised.

There are 699 agricultural holdings on the 1958 valuation roll, of these only 23 are neither statutory crofts nor holdings of similar status (see Table 9, page 25). About half these holdings have less than 5 acres of inbye land; only 18% have more than 10 acres. Very small holdings are a particular feature of the Carloway district (73% less than 5 acres) and, to a slightly less extent, of East Loch Roag district (42% less than 5 acres). Relatively large holdings are most important in the Bernera district (59% greater than 10 acres). In South Uig, despite the large number of holdings formed within the present century, only 15% of all holdings exceed 10 acres, (c.f. Carloway: 5%). Details of the size-distribution of holdings are given in appendices A(3) and C(3), and are summarised in Table 37(a).

Although still illegal at the time of our survey, it is not surprising that sub-letting is extensively practised, along with other forms of amalgamation, as described in Chap. III (page 30). Thus arises the distinction between 'holdings', which are generally tenancies of different individuals, and 'working units', which may include several holdings. The latter are potential units of agricultural production and are generally larger than the holdings.

However, the structure of potential agricultural units is not the product of one process alone. Amalgamation is important but so also, in certain districts, is 'sub-division', a process which tends to reverse the development of larger agricultural units. By 'sub-division' is meant not only the unofficial sharing of crofts by two or more families, which still happens but is no longer very significant, but also the individual enclosure of small pieces of the common pastures. Such enclosures are, nowadays, generally subject to the approval of the township committee and of the factor, some may even have a feu charter; nevertheless they are the contemporary representation of the age-old custom of squatting on common land, a process which increased the number of crofts in some areas in the course of the nineteenth century, (Chap. III, page 17). Such holdings are here classified as 'working units' provided that they carried either a cow, or at least five sheep, or more than a quarter acre of cultivation, including hay.

Finally, since a proportion of the 'working units' (potential units of agricultural production) are neither stocked nor cultivated, we must distinguish between them and the actual units of agricultural production, here termed 'effective agricultural units'. We accounted for 580 of these, (page 30). Their distribution by districts, according to the acreage of the units, is shown in Table 37(b). Comparison of table (a) and (b) demonstrates the effect of unofficial re-organisation of the crofting structure. In particular, Carloway excepted, the proportion of units of less than 8 acres is reduced in practise from 72% to 47%, and the proportion of units of more than 10 acres is increased from 18% to 30%. In Carloway the result of amalgamation is masked by 'sub-division'; in that district there are about 30 small holdings which carry stock even though they do

427 311 [178] not have crofter status. Thus, despite the rigidity imposed by crofting legislation, the crofting structure is evolving; whether the larger units so formed are agriculturally more productive than the smaller, statutory, units is another question.

Cattle and sheep stocks

231 178 The production of cattle and sheep is the main function of the croft, from the agricultural point of view, and the main function of the crofting parish. In this respect a great change has occurred in the last 80 years: about 1880 some 3,300 cattle and 14,000 sheep (of all ages) were kept; in 1959 the corresponding figures were 1,281 and 35,000. This change is by no means the result of the re-settlement of crofters on former farms; in 1879, according to the Report of the Royal Commission on Agriculture, the sheep:cattle ratio was 2.3:1 on the crofting townships and 9.6:1 on the farms: now it is 27:1 over the whole parish. The change (Table 38) has been fairly uniform over the parish except that, whereas sheep stocks generally have more or less trebled, in the Carloway district they have little more than doubled.

[167] [162] The decline of cattle numbers has been at the same rate as that of the human population and this, together with the much lower sheep:cattle ratio on crofting townships than on farms in 1879, suggests that, 80 years ago just as to-day, the main object of cattle keeping was subsistence rather than commerce. The increase in sheep numbers on the other hand is probably no more than a reflection of increasing disregard of the soumings.

233 311 178 If we compare the cattle and sheep stocks with the soumings shown in Table 38 and Appendix E we find that 80 years ago, except in Bernera, there was rough agreement between stock and soum. To-day cattle stocks are around one-third of those allowed by the soum whereas sheep stocks are greatly in excess. Examination of the soumings leads one to question their validity in the light of modern conditions: the sheep soums bear no regular relation to the available areas of common pastures (Appendices A(2) and

TABLE 39

Stock carried by working units

233 311 178 [427] C(2)) and the cattle soums appear impossibly high unless large quantities of winter fodder are imported. In the old townships the soums of each croft are still based on minor variants of the traditional "1 cow and follower and 8 sheep per pound rent"; the rents, however, were calculated on the potential value of the croft in days when an inexhaustible supply of labour was available for production of winter fodder by cultivation. This is no longer the case and the old assumption no longer holds.

Township pastures are seldom, if ever, used to best advantage. Because the regulations generally allow unlimited substitution of sheep for cattle, the soumings are not, in theory, exceeded by the presence of the increased flocks of sheep. In practice, however, the situation is quite different. In the first place the difference between the effects of the grazing of sheep and cattle on the hills is not widely appreciated. In discussions some crofters remarked on the change during the present century in the appearance of the nearer hill pastures - "they were green when I was a boy, now they are black", - but this was seldom correlated with the decline in cattle and increase in sheep. There can be no doubt that the increase in the ratio of sheep to cattle has generally led to a deterioration of the grazings. Further, there are almost five hundred separate sheep packs on the parish pastures, most of them with less than 20 ewes; at some fanks the men and dogs seem to outnumber the sheep! Little real sheep-herding is done - nor can it be by men who have other regular employment. Consequently the hills are not grazed evenly: some areas are grossly over-grazed whilst others are neglected. This situation has grown worse with the decline in cattle numbers and consequent abandonment of the shielings, the occupation of which ensured that use was made of the more distant pastures.

361 233 311 178 Yet another factor inhibiting proper use of township pastures is their situation and shape. Many townships, particularly in South Uig, have detached areas of hill pasture, former shielings. These are often singularly inaccessible now that the custom of staying at shieling huts has ceased. Other township pastures are long narrow strips running inland for up to seven miles. Straying from one township's lands to those of another is therefore common. Individual allocation of the hill pastures is not practicable but a certain amount of fencing and, possibly, the employment of a paid township shepherd (as in the nineteenth century), would help.

233 311 631 If we examine the stocking of individual working units, Table 39, we find that only 30% carry more than their total soum, 35% carry between a half and a full soum and a further 35% carry less than half their soum. The situation does not vary very much as between the four districts, although there appears to be a slight tendency for working units in

CHAPTER FOURTEEN

CONCLUSIONS

H. A. Moisley

121 The relationships between Place, Folk and Work are seldom sim community such as Uig they are particularly complex. The object make an impartial, factual record of the physical and human resour sation, as described in the Preface (Part I, page i). The primary is to make our observations available to others and to this end we ha deal of fact leavened, we hope, by a modicum of personal impressio however, it seems appropriate to add certain personal conclusions observations and data relating to the crofts and townships visited.

[162] The outstanding fact is that, over the whole parish more than a lation between the ages of 15 and 64 has to leave home in order to those who remain at home, 80% of the men are more or less engage most all of these have some other source of income, usually weavin the cash income from agriculture must be less than £100. Althoug 60% of resident males as 'crofters with regular employment' this m [434] necessarily the same as having a full-time job. The average incom Uig, for example, is only of the order of £250 per annum. Thus c employment, or employment with ancillary crofting as is more often a good deal of under-employment. Such low incomes and hidden un characteristic of West European under-developed regions.

427 433 000 The crofting system can never provide an ideal structural systen that is not its real purpose. It is a social system and, whether it i or not, it exists. It should not be allowed to decay for that would n to the crofting communities but would also, in the case of islands an lead to the abandonment of potentially productive resources of land a it be preserved unchanged; preservation would mean fossilisation a The present crofting system was cast in a legislative mould in the la when population pressed heavily on the resources of the islands. C now changed and the mould must be altered or the communities will

This is not to say that wholesale reorganisation is required, at l But the authorities charged with the welfare of the crofting township a whole, have a duty to see that crofting evolves towards something productive. Subsidies alone are a confession of defeat. It is not g spend money to alleviate the symptoms of a disease which it is now 'under-development'. Realistic planning is required so that the spe ture incurred in such regions becomes a productive investment and form of charity.

It is encouraging to note that such economic and technical develo place (particularly the development of weaving and the improvement owe a good deal to local initiative and local investment. This sugge guidance and encouragement, the crofting townships can do much to would be an excellent thing if, in each district, informal and quite un groups could be started to think about the future of their particular development and not decay.

Realistic discussion of development must face certain facts even they may be unpalatable or politically unpopular. Amongst the most

ownships in terms of

though in some cases
important are these:

000 1) Further depopulation is inevitable but is not necessarily bad. The special privileges
161 of crofting tenure have tended to delay the inevitable because the agricultural structure
162 has been unable to adapt itself to changing circumstances. The land is in some ways less
311 productive than it was 80 years ago. But, as population does decline, eventually more
433 land ought to be available for each remaining family and, if properly used, should enable
them to increase the proportion of their incomes derived from agriculture. Thus depopu-
lation could have beneficial effects provided it were not haphazard nor complete. The
rate and ultimate extent of depopulation could be controlled to some extent if a realistic
assessment of the possibilities of each district were made, followed by a vigourous attempt
to realise these possibilities. This must be done locally because the problems and possi-
bilities of each district, sometimes of each township, are different. How can this be done?

288 2) It is not realistic to plan for any extensive development of industry nor for any sub-
stantial further development of forestry or fishing. Lewis is suitable for the development
of industry - the phenomenal growth of the Harris Tweed industry, with an annual output
worth £5 million, much of it for export, is proof enough of that. But when it is difficult
to get industrialists to invest in lowland Scotland there is little point in living in perpetual
hope in Lewis. To constantly cry, as some politicians do, that 'the government should
send industry to Lewis', is not helpful, either, for no government has ever had sufficient
power, nor is it desirable that it should have, to force a firm to invest against its will.
If there is to be some industrial development it must come willingly; it would be unwise
to depend on it. It follows, therefore, that agriculture must be made a more efficient
basis, though not the sole basis, of most crofting communities. The present heavy
dependence on casual or seasonal employment, and on permanent employment away from
home, can never provide the bases for a truly viable community though it may provide a
useful outlet for some younger folk. On its present scale it leads to the neglect of the
only widespread natural resource, the land, as well as encouraging permanent emigration.

311 3) Crofting agriculture, as at present carried on, on most crofts, does not make the
433 best use of the local resources. The land is marginal in many respects and the develop-
ment of an economic form of agriculture requires:

(a) particular skill in farm management, including initiative and technical ability to take advantage of new materials and methods, and
(b) a marketing system on which the crofter believes he can depend. At present it is the uncertainty, as much as the poverty, of the reward that deters young men from taking up agriculture seriously.

427 4) The small size of holdings need not be a serious disadvantage. Since the time of our
survey subletting is no longer necessarily contrary to the conditions of crofting tenure;
since it represents a voluntary evolution towards larger holdings it, rather than wholesale
reorganisation, should be further encouraged.

5) It should be recognised that if a croft is not properly stocked it cannot justifiably be
the subject of any of the privileges of crofting tenure. Failure to maintain a properly
balanced stock is damaging to the land and to the ultimate well-being of the community as
a whole. At one time the factors, through their ground officers, maintained a degree of
control over the stocking of township lands and this could, in some way, be resumed - if
not by the proprietors then by the Crofters Commission, - though the best way would be
voluntarily, through the township committees. This would depend on establishing soumings
which fairly represented the grazing capacity of the township lands; and on restricting the
unlimited substitution of sheep for cattle. At present many soumings depend on restate-
ments of old ones the validity of which is very dubious; soumings are unlikely to be res-
pected unless they are reasonable.

181 6) Few crofters possess sufficient technical knowledge and confidence to make the best
use of their land. It is particularly difficult for men with such limited resources of land
and ready cash to embark on new agricultural enterprises; they are naturally reluctant
to take risks and therefore tend to be excessively conservative. This cannot be put right
quickly nor so long as the majority of those working the crofts are middle aged or older
men who have spent the greater part of their working lives in other occupations. Such
men require special help but, above all, some of the younger men must be encouraged to

THE PATTERN OF CROFTING

427 Crofting, a distinctive system of land tenure, is confined to Argyllshire, Inverness-shire,
241 Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland, the seven Crofting Counties of
178 Scotland. Small agricultural units sharing rights in common land, usually pasture but in some
423 districts arable land also, survive in 151 out of the 163 parishes, and these holdings form the
477 nearest equivalent to peasant communities in Britain, although only a small minority of crofters
own their holdings, and the true subsistence element, implicit in any definition of peasantry, has
all but disappeared.

175 Before 1886, the crofter was a tenant-at-will, with no security of tenure, and no right to
427 compensation for improvements. The Crofter's Act of 1886, defined a croft as an agricultural
241 holding in a parish where there existed, or had existed, rights of common grazing, and where the
423 annual rent paid was less than £30. Security of tenure, and compensation for improvements
were the main provisions of the 1886 Act; the rent qualification was later raised to £50. In all,
there are about 20,000 crofts in Scotland today[1] and Collier[2] estimated the crofting population at
161 about 100,000. The number of crofts in Park is 215, with population of 908. Thus Park forms
162 a 1 per cent sample of the crofts, and a 0.9 per cent sample of the estimated crofting population.

Crofting Organisation, Layout, and Settlement.

423 The characteristic settlement unit is the crofting township: Figure 3 illustrates the areal
427 distribution of the 12 townships in Park. Each township comprises two main elements, the
061 individually held croft land, and the common grazings. The number of crofts per township
311 ranges from 6 in Caversta to 43 in Gravir.

632 The individually held croft land (1,839 acres) is partly 'outrun' or permanent pasture and the
233 holdings are usually but not always consolidated - in Gravir (Fig. 4) and Cromore some of the
crofts comprise as many as five non-adjacent pieces of land. Each croft is normally separated
from neighbouring units by a drystone dyke or fence but in Park, such demarcation is the
exception rather than the rule.

The croft land is separated from the common pasture by the township dyke, a stone or turf wal
The Park common pastures consist of 22,023 acres of moor grazing - generally very poor, ill-
drained land with a large percentage of bare rock, areas of peat, and numerous lochs. In Park,
only Oronsay common pasture is fenced, the limits of the remainder being faintly marked by
crumbled turf dykes. Each croft has a defined right of grazing or 'soum' on the common pasture;
the 'soum' is the number of beasts which may be pastured, a term comparable to the
obsolescent 'gates' of northern England. In Gravir, the soum is 1 cow and follower or young beast
up to 6 quarters old (i.e. 18 months), and 8 sheep, per £1 rent. There is also a system of stated
equivalences (Gaelic 'coilpeachadh') in most townships whereby substitution of cattle for sheep and
sheep for cattle is permissible: in Gravir, the exchange rate is one cow for five sheep. Soumings
and equivalences vary throughout Park. In former times, when a subsistence economy prevailed,
soumings were enforced but nowadays the majority of the crofters do not even know the souming of
their croft.

113 1 Crofters' Commission, Annual Report 1958.

113 2 Adam Collier, "The Crofting Problem", 1953.

ed sons into the house. Family solidarity was strengthened 175* 178* 427 593 591
ch cottage came to be the home of a three generation family
. Adjacent crofts, more likely than not, were bound to-
r in a network of collateral and affinal relatives. Two
e underlying principles of the clan were reaffirmed. The
r was the source of the means of subsistence, and the
g, almost sentimental, attachment for the land was an
ssion of the sentimental tie of kinship. Economically,
vision was paving the way for disaster. It forced a
ily increasing dependence on the potato; the people
not grow enough grain for household needs.

Commercialization means more than the conversion of land 175* 178* 361 621
source of monetary revenue and the supplanting of customary
s by contractual relationships. For its fulfillment it
res the growth of villages and the development of a di-
n of labor which allows specialization. Events in England
owland Scotland, could not have left the island untouched.
irst rumbles of the Industrial Revolution had been followed
vigorous growth of urban centers. The mass movements of
ural population into these communities, as their rights
e land were disregarded and the people were driven off
de into wage laborers, were creating a new cultural
rn. The benefits of the towns to the nation had the
rance of being unlimited. It was inevitable that villages
d be advocated, planned, and fostered on Skye, the most
ous of all the Hebrides. It was no less inevitable that
ges should have limited attraction for the Sgiathanach.

While the process of commercialization proceeded against 175* 178* 348 231 439
persistent efforts of the people to maintain their tradition
way of life, events in Great Britain were beginning to have
onounced adverse effect on the local economy. The end of
Napoleonic Wars brought the cattle boom to an end. Al-
gh the droving trade remained brisk, the value of the stock
ined markedly.[37] An increase in the number of cattle on
grazings, as a means to maintain an economic equilibrium,
impossible. The island was already overstocked and had
devastated by this practice. At the same time, develop-
of large scale commercial farming in the Lowlands had
oached on the right of way of the drovers, and the Skye
le were suffering at the markets from competition with
oved, better nourished breeds from the northeast and south-
. The end of the wars also witnessed a decline in the
market.[38] Parliament finally completely undermined kelping
ecurrently reducing the tariffs on foreign substitutes.

The crofters, who had suffered rackrenting to get their 175* 178* 427
l strips of arable, found themselves without the means to
the rents which had been set at the peak of the cattle and
markets and without enough land to meet subsistence needs.[39]
striking thing is that in spite of increasing economic [161]
ship, the population continued to grow. They became hostages

o the health of the potato and their own fertility.[40] Many
ere forced to labour on a part-time basis, but once again
the initial success was short-lived. Others supplemented
their diminishing incomes from the croft by seasonal employment
n the Lowlands. Crofting had ceased to be a subsistence
economy; the people had lost their self-sufficiency. Nor were
they ever again able to escape from a dependence on some form
of supplementary income to provide the bare essentials of life.
The difference between conditions then and now is that the
pressure of the population on the means of subsistence increased
until it approached a Malthusian ceiling.

In the thirties epidemic and famine began to take their
toll. Destitution became widespread and there was no system
of relief beyond the moral obligation of the proprietors to
provide grain. The marriage rate fell. In Kilmuir the average
annual number of marriages fell from twenty-one to six. Cohabitation was forbidden, but it was too late. In two districts
of Kilmuir there were 190 bols, crofts, and farms to support
1841 families in 1841. In all of Skye, after the emigration of
at least 1500 people, there were 1900 crofters and 1531 cottars;
despite the fact that oats had become as big a luxury as meat
and the fact that many were living on potatoes and fish, the
population continued to increase. By 1841 it reached 23,074.
Finally, the economic structure collapsed.

In the winter of 1845 there were no potatoes. A blight
destroyed the entire crop. Although the famine was universal

ruled by elders, and a heritage which had never admitted
compact, non-rural population centres. These basic cultural
values and patterns were given religious sanction.

Year by year throughout this period the following and
the influence of the "Men" increased. As the ministers were
removed, especially as the old hereditary families of ministers
closely related to the old gentry were replaced by ministers
from the people,[52] the "Men" became influential in the Church
as elders. Now they could not only exhort the people but
also judge them, by determining who was worthy of communion
and whose children might be baptized. The strength of their
control, however, did not require holding office. In Duirinish
well. Destitution became widespread and there was no system
of relief beyond the moral obligation of the proprietors to
provide grain. The marriage rate fell. In Kilmuir the average
annual number of marriages fell from twenty-one to six. Cohabitation was forbidden, but it was too late. In two districts
of Kilmuir there were 190 bols, crofts, and farms to support
1841 families in 1841. In all of Skye, after the emigration of
at least 1500 people, there were 1900 crofters and 1531 cottars;
despite the fact that oats had become as big a luxury as meat
and the fact that many were living on potatoes and fish, the
population continued to increase. By 1841 it reached 23,074.
Finally, the economic structure collapsed.

Period III (1845-1886)

By the beginning of the third epoch of the modern phase
of Skye's culture history, all the elements necessary for a
social and economic reshaping to the wiser commercial,
contractual society had begun to function. The socio-economic
changes in the preceding periods, especially the partial
commercialization of the land, the abolition of the tacksman
system of tenure and runrig farming, the establishment of a
village, and the extension of regular communications, had paved
the way for the final stage in the process of commercialization.
It was now an aforesaid fact that industrialization in Scotland
was to be a lowland phenomenon. The disparity between the
Eastern and Western Highlands was already well developed.[54]
The former had become a region of commercial farmers, men
with the incentive and ability to make technological advances.
Now economic deterioration led the landlords to attempt a
basic change.

The bankrupt proprietors, anxious to recoup their losses,
found sheep farmers eager to buy or lease the virgin grazings
of Skye. Sheep farming meant the landlord would have a secure
rental several times that his tenantry crofters and cotters
could pay, and he would not have to spend any capital either
on behalf of the incoming tenant or on behalf of an indigent
tenant unable to make his own way. The sheep farmer had the
capital and, even more important, the incentive to adopt
scientific methods. The crofter, obviously, had neither the

[54] Cf., e.g., Collier, The Crofting Problem, pp. 43-51.

means to acquire capital because he worked on very narrow
strips of land and was unable to improve his holdings because the
system forced him to conform to traditional techniques.

The trend to sheep farming, developing from an early
as 1810, led to a sweeping disruption for the customary rights
of the Skyemen. The factors (estate managers) of the absentee
landed gentry, the new landlords, and the crofters had no
associations with the tenantry and no use for their labor.
Thinking only in commercial terms, they were only interested
in seeing the higher grazings, the crofters' shielings, under
sheep flocks in summer and the lower pastures, including the
crofters' arable, in use during the winter. Thus, the
"Clearances" took two directions.[55] The majority of the people
seem to have lost their common grazings. In Kilmuir, according
to several informants, they were left with only one small area
of hill. Glenaile suffered from the same policy. Many of the
tenants were removed from their township, by force or persuasion.
To be exact, no fewer than sixty-two townships were cleared
of their people. The evicted people were left to
their own devices to reclaim a piece of the open moor, settled
in existing townships, or banished from the island. In the
area immediately to the north of Portree, forty crofters and

[55] For details on the "Clearances," see Alexander MacKenzie, The History of the Highland Clearances (Inverness: A. and W. MacKenzie, 1883), passim.

This work, as it is commonly referred to in Great Britain. See also Alexander MacDonald, The Past and Present Position of the Skye Crofters, sheets 9-13, 21-22.

eighty cottars in four townships were replaced by two shepherds
brought in from the mainland.[57]

As the interests of the proprietors and their tacksmen had
changed at an earlier time, those of the landlords and their
stewards were now irreconcilably opposed. The appearance of
the Lairdsquabble in England has been described as being characterized by absentee landlords, pauperism, and a decline in
the rural population through death and migration.[58] A process
which had begun three centuries earlier in England and which
had reached the British Borders two centuries earlier had
at last become operative on Skye. Let us examine the effects
of full scale commercialization on the Skyemen.

The effects are evident. Commercialization and the
evictions, which were a necessary counterpart, prompted
emigration and confined the people within narrow limits, often,
on inferior land.[59] By 1861 it was possible to describe Skye
as a quiet pastoral land, desolate and deserted.[60] The people
had been pushed into a few isolated, badly subdivided townships.
In Bracadale, the first parish to be fully commercialized,
there were nine thirty-six runrig farms; in 1861 there were six
large grazing farms.[61] The bulk of the population, 920, were

[61] Hanlon Report, p. 15.

cottars without any legal hold on the land. In Duirinish
parish, which includes Glenaile, only twenty-one families had
enough land to meet even subsistence needs.[62] In one Glenaile
township, Holmisdale, some crofts of four acres had as
many as fifteen people to support.[63] Part of this extreme
congestion was due to the continued practice of subdividing
the crofts even as could survive. Although the population
in 1841 had fallen to 17,660, from 23,074 in 1841, almost
every township had two or three times the number of families
which had lived in them in 1841.[64]

The loss of the summer shielings and the common grazings
meant few could keep sheep.[65] The sheep were almost the
only cash crop that could be based on the value of livestock
and was wholly or partially paid from the sale of cattle, all
oats, which the graziers' sheep did not eat, went to feed the
cattle. The mills were all but idle. The people had to buy
flour, meal, and bread imported from Glasgow. Almost all
were heavily in debt to the local merchants, who seem to have
been successors with more aspirations with the graziers than
the crofters and cottars. Milk became a precious commodity.
Frequently, the old cow had only enough for her calf. Unable
to keep horses, the women became beasts of burden. They carried

[62] Ibid., p. 112.

[65] The following is drawn from the evidence presented to the Napier Commission by the crofters and cottars of Skye; see Napier Report, Appendix I, pp. 1-20.

the dung from the byre, the peats from the moor, and the oats
from the fields. When the land had been turned by ploughs
they toiled therefore to a harrow. The crofters, in Kilmuir,
elsewhere, lost the right to the rivers for fish, to the moors
for game, and to the coast for sea weed. The land became exhausted from over tillage. They had clung tenaciously to the
old methods. Even if they could have obtained credit and could
have broken with the ways of their forefathers, the fear of
rackrenting would have deterred them.

A degree of preciousness can be given to this general
picture by comparing the arable acreage and stocking of Skye
in 1810, the year grazing first appeared, and 1870. In 1810,
30,000 acres were listed as arable, either cultivated or
susceptible to it; there were 18,000cattle and 40,000 sheep.[66]
By 1870 no more than 8,331 acres were considered as arable;
there were only 9,341 cattle, but there were 136,077 sheep.
The magnitude of this change can be emphasized by adding the
fact that there were less than 14,000 sheep on the island at
the turn of the century.

The end of the existing life brought an end to the
traditional reason for crofting. Destitution forced a post-
ponement of marriage and an absolute reduction in the number of
marriages. As a natural consequence the birth rate fell.
In the decade 1861-1870 the birth rate of Skye stood at 26.1
compared with 34.4 for Scotland.

[67] Ibid., II, 553; III, 247; IV, 131; XVI, 148, 225, 537; XVIII, 126.

sufficiently to make age contrels an irresistible force, the
prestige status of the small number of the "elect," those
who had experienced a saving change, and, in particular, the
elders gave them complete control over all social and religious
activity. In a later chapter I shall have more to say about
these facts. The important fact which I want to emphasize now
is that the religious patterns provided a framework in which
the culture could find continuity and through which the society
could achieve a reintegration. The abhorrence of pagan-like
customs resulted in a change of content, but the same
positive results as well as negative ones was a change in
focus for the culture and society. The decadent belief in
clan brotherhood was replaced by a sense of belonging to a
known religious brotherhood.

Summary. The third period of the modern phase of Skye's
culture history saw the culmination of the process of
commercialization of the land. All the influences necessary
for the conversion of the subsistence economy, which a subsistence
proletariat economy, had begun to function. Sheep farming,
on a commercial scale, formed the basis for the new economy.
Newcomers with the incentive and ability to introduce improved
methods of land utilization were replacing the conservative
and impoverished crofters and cottars. As the commercial
farmers consolidated their holdings, the common grazings
were being abbreviated. The concept of individual possession
of the land was replacing the customary rights of the small
tenants, and a clearly defined social hierarchy, based on

wealth, rose above the indigent crofters and cottars.

These changes had a pronounced effect on the culture and the population. Economic hardship and evictions prompted emigration, forced many men and women to seek seasonal work away from home, and led to a reduction in the marriage rate. Crofting which had already become part-time agriculture now was a spare-time pursuit. The Gaisthanach was dependent on money, on the wider economy, for the satisfaction of most of his needs. The croft was providing no more than a few potatoes for the table and some oats for the cattle, the crofter's only export. Still, no landless wanting force appeared. Pastures had grown and there was a woolen mill, but there does not seem to have been any marked movement into the village by the crofters.

While much of what was meaningful to the people was being lost, the religious Revival continued. The conservatism of the "Men" became an ideal policy of a new church. The emotional approach of the ministers and the "Men," who were now elders in the church, and the emotionalism of the large outdoor meetings functioned to restore the social disequilibrium. Although the extended family, township, and nuclear family suffered from instability, the people found intelligible roles within the religious sphere of activity. Their religion was reinforcing their way of life. The abhorrence of much of the old culture was accompanied by a strengthening of many traits which reaffirmed the desirable status values. The culture found a new focus in congregational religion and was able to maintain a continuity while the content changed.

tection and endowed with privileges and immunities by which self-regulation, stability, expansion, and improvement might be attained. Additional provisions called for the replacement of the repudiated customary usages by national laws of land tenure.

The Crofters' Holdings (Scotland) Act of 1886 embodied many of the Commission's proposals.[80] The crofter became, perhaps, the only class, as a horizontal segment of the population, with a minimal legal definition. He was a pastoral agriculturalist who resided on his holding, the annual rent of which was less than £30, (later raised to £50) in a crofting parish. Such an individual was entitled to a fixed, fair rent, just compensation for improvements made by himself or his predecessors in the same family should he leave his holding, security of tenure, and modified right to bequeath the holding to a member of his family. Except for the statutory conditions that he must not alienate the holding from his family, sublet without consent, or violate the rights of his neighbors or his landlord, including withholding rent and contributing to the deterioration of the land and dwelling, the crofter was given all the privileges of a landowner with few of the responsibilities. A Crofters Commission, with executive functions, was established to carry out the provisions of the act and to assign "available" land to the townships as

[80] I owe a debt of gratitude to innumerable government officials in Portree, Edinburgh, Glasgow, and London for their patience and cooperation in providing me with the necessary information to discuss this final period of the history of Skye. The facts are theirs; the interpretation is my own responsibility.

enlargements when the proprietor would not lease it on reasonable terms. Thus, the government began to protect the crofter from potential abuses and to restore the land to the descendants of the clansmen, who had, to say the least, manifested a persistent disinclination to accept any other system of land use. A complete refurnation, however, was not yet possible.

The crux of the problem of maintaining the crofting population was succinctly stated in 1851 by the chairman of the Highland Destitution Board. The people could not support themselves, at a subsistence level, unless each crofting family were given ten acres of arable land plus pasture. Not only was there not enough land, but without credit facilities, a man could not find local employment until the land began to produce, and, if he sought employment at a distance, he could not work his land to free himself from the necessity of working for a wage. In 1883 it was estimated that a 50 percent reduction in population would not leave enough land to give each family an adequate holding, ten acres of arable and 277 acres of grazing land.[81] Now right they were. Today the population is less than half that of 1883, and still very few have what was considered an adequate holding a hundred years ago. Let us see what measures the government took in the attempt to solve this problem.

At first the land reorganization program was thwarted by a lack of available land and by the continued tendency of

[81] Napier Report, pp. 100-101.

the people to overstock. No land could be assigned as an enlargement if it would impair the value of a sheep farm or a deer forest. The remainder of the island was already possessed by crofters. Moreover, there was no one to regulate the use of the common grazings. As the Crofters Commission usurped the functions of the landlord, estate management became lax. The township constable had disappeared. The cotters, 36 percent of the population, had been omitted from the provisions of the Crofters Act. Later when the government provided for a grazing committee to draft voluntary regulations for sharing the common grazing and, finally, coerced the crofters to elect a grazing committee, the regulations could not be enforced, except by appealing to the sheriff.

At length another commission of inquiry visited the Highlands to decide how the resettlement program might be extended. Then, in 1897, the Congested Districts Board was created. The Board was given power to purchase land for enlargements and for creating new holdings, to resettle crofters and cottars from congested districts, to foster the development of stock breeding, agriculture, fishing, and home industries, and to improve communications. It was not intended that the government should become a landlord. The crofters, like the Irish small farmers, were supposed to have acquired a desire to own their own land. In 1904 the estates of Glendale, the present twelve townships, and Kilmuir, the whole parish and part of the parish of Snizort, were purchased. On the Kilmuir Estate there were 450 crofts in 35 townships and 10 large farms.

heavy rackrenting in the past had led to dissatisfaction and arrears in rent, the crofters' weapon against the landlord. The rents were revised and most of the arrears were cancelled. All of the farms but one were subdivided to form 79 new holdings in 7 unenumerated townships and to make enlargements to the other crofts. The Glendale estate received similar treatment, being made over into 147 crofts in 12 townships plus a jointly held club farm. Both estates were sold to the crofters on a fifty year annuity basis. Then came a rude awakening. Within ten years the crofters found ownership to be a dubious privilege, especially since it excluded them from the benefits of legislation favoring the small tenant. The Kilmuir crofters were released from the contract, but the government refused to accept the petition of the Glendale people, who still are not pleased with their rather unique position. Private ownership of the land might be said to be as alien to their heritage as village settlements.

Land settlement continued, with the introduction of certain refinements, the most important of which was the power to use compulsion to acquire land for crofting in the national interest. Today over half the island is owned by the national government and administered by the Department of Agriculture. The tendency in recent years has been to create more adequate holdings. On the Kilmuir estate the number of crofts has been reduced from 530 to 442. The process of resettlement, or de-commercialization, has been carried further on Skye than in any other Highland area.[82] It has also included the only major

[82] C., op. cit., pp. 90-111; and Dance, op. cit., pp. 61-63, 64-65.

migration scheme to be attempted. In 1923 sixty-eight families from the Isle of Harris, in the Outer Hebrides, were brought over to Skye and settled in Braeadale. Probably, close to 300 new holdings and in the neighborhood of 200 enlargements have been made since 1897. This clearly reflects the limited space available for crofting at the end of the "Clearances."

In addition to land settlement, the government has continued to stimulate improvements in stock breeding techniques and to foster more efficient land utilization. Credit facilities, by grant and loan, were offered to enable the crofters to purchase stock, especially sheep, and to build new cottages. Grants and subsidies, in an ever increasing number, have been made available to promote a fuller use of the land. Initially, under the Congested Districts Board, these facilities were devised specifically for the Highlands. By the time the Congested Districts Board was abolished, the crofters had become officially integrated with the national agricultural scene so that specific subsidies, grants, and loans were replaced with an opportunity to apply for assistance within the national program of agricultural development. Instruction in scientific methods of agriculture has been another continuing function of the government through a series of advisory services and, more recently, by a program of demonstration crofts and farms. Access to markets has similarly been facilitated by improving communications by land and, to a lesser extent, by sea.

Security and protection for the crofters has been another unfailing interest of the government. Again, with official integration, the scope of legislation has been extended to

include all small tenants in Scotland. The landlords have lost their right to evict a crofter for breach of conditions. Since 1911 only the Land Court, which replaced the Crofters Commission, can remove a tenant who is guilty of bad husbandry. Moreover, such action can only be taken after the general circumstances of the crofter and his need of the croft for a home have been considered. To date, no Highland crofter has been removed. In fact, security of tenure has been carried to the extreme that the individual no longer has to reside in Scotland much less on his croft. Although this change is now regarded as inadvertent, the courts have ruled in favor of the small tenant. The only remaining functions of the landlord in estate management are to collect his rents and pay compensation should a tenant desire to leave. Both the rents and the compensation are determined by the Land Court.

Accompanying the integration of the Island with the national scene, politically and economically, were extensions of social services. Prior to 1872 education was the responsibility of the church, charitable agencies, and, especially in the Highlands, the local proprietors and their financially secure tenantry.[83] Although the parish school system was national, the administration of each parochial school was local. The ideal of a school in each parish was neither adequate nor easily obtainable. The result was a few regularly taught schools.[84]

*175 crofting system. Both the communal nature of the system and
*178 the smallness of the crofts deter improvement. Although the
●427 government reversed the trend toward making the land an im-
241 portant source of wealth and individualization of the land, by
[84] replacing customary forms of tenure with national laws of
tenure, and has tried to correct the disadvantages under which
the crofter labors, if not always successfully, the Skye
crofter has made only a partial adjustment to the larger,
[31] specialized national culture. In fact, the land is used less
systematically than it was in the past, in the times of the
[31] shielings. The crofters have not only ceased trying to
reclaim arable but also have allowed much of the arable to go
back to grass.

*175 Ever since the closing years of the first period of
*178 the modern era, Skyemen have sought employment as a part of
464 the national labor force. During the third and fourth periods,
they joined the landless labor force in the Lowlands. There
is practically no local opportunity for a landless man to
support a family. The majority must remain pastoral agri-
culturalists who depend on seasonal employment, or some other
form of financial assistance, to augment their income.

*175 Improved communications and the ensuing development
*178 of commerce has brought a village to the island. It functions
361 as a market center and as the administrative center for the
island. It has not served to bring the island together; it
is still something alien to their heritage. Accompanying
the growth of the village, there was local development in the

While
the Irish and Scottish Highland systems of land use
427 reveal many underlying similarities, they are distinguished
3 by their respective systems of land tenure. The Irish small
farmer owns his land, like the Glendale crofters, and has a
self-contained holding, like the large crofter on Skye.[3]

Croft Size. As the foregoing discussion has suggested, there is a wide range of croft sizes. Some crofters have only a few hundred square yards of the poorest soil. A few have large, relatively fertile holdings. One of these large crofters, for example, has 88 acres of arable land, 27 acres of pasture, and 1261 acres of grazing. The most common size is less than five acres, and not more than 500 of the 2200 crofters have over ten acres. If all of his land were of equal potential agricultural value, the individual with ten acres might be able to attain a satisfactory standard of production. Unfortunately, not more than half of most crofts can be considered as suitable for crop cultivation. In Glendale, for example, the average size is ten to fifteen acres, but when the boggy ground and the area in drainage ditches are subtracted, it is indeed a fortunate man who can profitably cultivate more than five acres. What, then, does he do with his land?

Land Use. Between spring ploughing and the harvest season, the best land is planted in oats, potatoes, and, in some cases, turnips. On most crofts, for every two or three acres of oats there are a half acre of potatoes, and perhaps, a quarter

[3]Arensberg, The Irish Countryman, pp. 36-38, 43.

427 acre of turnips. All of the oats and a large share of the
241 potatoes and turnips are used to feed the cattle during the late
231 winter and early spring. Some crofters, by no means all, have a small kitchen garden for cabbage, onions, and other vegetables. Usually, at least half the croft is left under grass, part of
427 which is cut for hay. After all the people in the township
233 have finished their harvest, on a day set by the grazing committee, the individual holdings in all but thirty of the townships are opened to communal use as winter grazings.[4] It might be added that the sheep and cattle often find the village of Portree a very lucrative pasture. It is not only the grass which entices the cows. More than one villager has had a tug-of-war with a cow bent on devouring clothes off the line. Another favorite food for the cattle is coal. As one man in the Braes said: "We burn half the coal; the cows eat the rest."

The Value of the Croft

427 What does a croft mean to the Sgiathanach? In terms of
511 everyday economics, there can be no simple answer. For a few, probably no more than fifty families, the sale of cattle, sheep, and wool provides an ample income. The families are able to obtain the necessities of life and enjoy a comparatively high standard of living. The majority live on crofts which cannot begin to support a solitary individual. Expecting little more

[4]F. Fraser Darling, G. C. Hayes, and Averil Morley, "The Agricultural Situation," The West Highland Survey, F. F. Darling et al. (mimeographed, 1951), Part V, pp. 14-15.

427 than the bare essentials, these people just get along. Even
511 so, they would be unable to get by were it not for some form of
464 supplementary income. This essential prerequisite for the
659 individual or family who upholds the crofting tradition may take the form of seasonal employment on the island or away from home; contributions from a child or, less frequently, a brother or sister; or payments from the government in the form of unemployment compensation, relief, or a pension.

427 Many a Sgiathanach thinks of his croft as a home more
131 than anything else. There are men who have found full time employment. Some in this catagory work the croft in the evening. Others expect their wives to care for the crops
887 and stock, or they leave the land untouched. Then, there are the old men and women who have returned to their an-
167 cestral homes to spend the twilight of their lives. These exiles come back from cities as near as Inverness and from places as far away as the sheep ranches of Montana or the cities of Australia. Perhaps, the most significant point is that for all Skyemen the croft cannot be evaluated merely in terms of acreage and income. As we shall see, it is a way of life in which an attachment to the land, as an embodiment of kinship, plays a very important part.

427 The incomes of three representative crofts clearly
514 reveal the financial difficulties under which the crofting family labors. Although I have somewhat arbitrarily divided the holdings into small, medium and large on the basis of acres of arable land, it should be remembered that this

427 normally determines the "souming," the number of stock which
511 each tenant is entitled to carry on the common.

427 The small croft has less than ten acres of arable and
241 improved grass land. The average "souming" is two cows and
231 followers (heifer or bullock calves) and usually ten to twenty sheep. Approximately 2000 of the crofts fall into this classification. The medium croft, representing about 250 land-holding subjects, has between ten and twenty acres of land fit for crop cultivation and improved grass. The typical "souming" is two to seven cows and followers, forty or fifty sheep, and occasionally, a horse. We might recall that the sheep may be either a club stock or a private flock. The large croft consists of almost 120 arable acres and, even more important in the predominately pastoral economy, an independent, self-contained grazing of 200 to well over 1000 acres. These diminutive ranches easily carry ten or more cows and followers and several hundred sheep.

427 For those who prefer to think in terms of area rather
231 than stock, the relative magnitude of these self-contained
632 holdings may be stressed by adding the fact that only thirty townships on Skye have more than 200 acres of common grazing. There are, for example, Linicro with 729 acres of grazing in 19 shares, Totescore with 500 acres in 12 shares, and Borneskeitg with 273 acres in 47 shares. Over half the townships have less than 100 acres of grazing land.[5]

[5]Ibid., Table 3.

427 The Income of a Small Croft. The small croft is regarded by
241 local agricultural experts as having a potential income of
231 £20 a year. In addition, it provides a home, potatoes, some
434 vegetables, milk, eggs, and the right to cut peat. Even if not quite legal until June, 1954, it frequently supplies mutton and, less often, beef for the family. The budget for this type of holding in my sample reveals that even when fully stocked and the ground tilled, the income may be negligible. Let us look at the cash income and net profit for 1952 and 1953.

In 1952 the cash income for the croft was £8 13s. 11d. The net profit, which takes into account depreciation and stock valuation after sales was £2 1s. 11d. In 1953 the cash income was £12 8s. 9d., and the net profit was £5 8s-. These figures include money from the sale of stock, government subsidies and grants, and home grown produce eaten by the family. Unfortunately, I do not know the number of hours which were spent earning this meager return. The crofter's wife said about 300 hours of her labor. To this we must add seasonal cooperative labor.

This particular croft is rented by a middle-aged married
464 couple and a spinster sister of the wife. The man works full
594 time as truck driver, leaving most of the work on the croft to his wife. The stock is two cows and followers and sixteen to eighteen sheep. There are six acres of arable land, half of it under hay and grass. The remainder is planted in oats, potatoes, and turnips. The budget may not be typical. For

427 241 231 434 [124] [125] one thing, an attempt is being made to build up the value of the sheep and cattle stock. Then too it is hard to obtain information on personal income. Not a few Highlanders are reluctant to share in the cost of maintaining the government and, consequently, equally reluctant to discuss their income. Still, it does give some indication of the potential income for 80 percent of the Skye crofters. It should not be forgotten that a large proportion of the small crofters will have absolutely no income from the land.

The Income of a Medium Croft. The medium croft, according to experts, has a potential income of £150 to £200 a year. Like the small croft, it provides a home, potatoes, vegetables, milk, eggs, meat, and peat. The budgets for one croft of this classification for 1952 and 1953 show a cash income of £203 17s 2d. and £170 15s. 11d., and a net profit of £169 12s. 1d. and £96- 11d. The marked fall in net profit is accounted for by a decrease in the acreage under oats, increased expenses, and the sale of fewer and younger stock, which also affected the cash income. The total hours devoted to crofting are estimated at 600 to 800 hours.

This croft supports a family, a married couple and their children, supplemented by seasonal auxiliary employment on the part of the father. As presently worked and stocked, it could not be left to a woman with any expectation of the same return. The stocking is two cows and followers and fifty sheep. There are 16½ acres of cultivated land, all but a quarter under grass.

427 241 231 434 This budget is nearer the estimate of the local Department of Agriculture officers and may be regarded as typical. It also reveals that crofting is not a dependable livelihood. My budget for the large croft manifests the pitfalls in crofting by an even more striking contrast between the two years.

The Income of a Large Croft. The large croft is said to have a potential income of £800 or more each year. The holder will be a full-time pastoral-agriculturalist. In reality, as mentioned earlier, the large crofter is a small farmer and often has more land than some Skye farmers. His holding cannot be regarded as providing a home, even though his rent and taxes will be extremely low compared to the farmer's. Nor does it normally, if ever, provide peat for fuel. The peat is there, of course, but the crofter does not have time to dig it. Indeed, if he were to take the time or hire someone to do the digging for him, the cost of peat, in terms of man hours approximately £10 a ton, would make it uneconomical, especially since it has only a quarter the caloric value of coal which he can and does buy for less. Like the smaller subjects, the large croft provides vegetables, meat, milk, and eggs for the table. The sample budgets which I obtained for a large croft show a cash income of £536 11s.5d. for 1952 and £802 7s.1d. for 1953. The difference is explained in part by increased sales of stock and in part by increased government subsidies. The net profit for the two years tells a far different story. In 1952 it was £829 6s.5d., but in

1953 it was only £313 2s.1d. This marked fall was due to the loss of sixty-nine sheep and one head of cattle, the effects of which would not be felt until the following year. 427 241 231 434

This croft is inhabited by a married couple, and the husband's father and younger brother. It requires the full attention of both brothers and, occasionally, hired labor, in particular in the spring when the sheep demand a great deal of attention. The income in 1953, it may be added, was considerably more than most Scottish tradesmen and not far below that of a university lecturer. The stock averages between five and ten cows with followers, ten head of beef cattle during the summer, and 400 sheep. The cultivated acreage is fourteen acres, usually half of which is under hay and grass. I regard the large croft in my sample as typical, but it is typical of less than 1 percent of all Skye crofters.

The Income of a Farm. For comparative purposes, I should like to briefly consider the cash income of one farming subject. The budget I obtained is far from typical. With twenty-one farms each with its own peculiar advantages and each farmed under differing technological conditions, I doubt that a representative type could be singled out. Moreover, the only way I could obtain a farmer's budget was to secure it surreptitiously; therefore, I do not know the details of stocking or the number who derive their support from the farm. We may be certain that it is one of the larger sheep farms. Despite an expense for hired labor of over £1000 each year, [124]

the cash income was £1044 3s 3d for 1952 and £1527 3s 9d for 1953. I do not know the net profit. 427 241 231 434

Summary. The foregoing facts and figures should make it abundantly clear that a man with less than ten acres of arable land and with a "souming" of less than three or four cows and fifty sheep can expect only a meager and definitely inadequate return for his investment of time and money. Several crofters thought thirty or forty acres were required. This would mean a "souming" of 10 or 12 cows and 200 sheep, if the present proportion of grazing land to cultivated area were maintained. Some said 300 to 500 sheep would be closer to the mark in order to make a good living on the land. The budget for the large croft confirms this view, but even then we have seen crofting to contain a precarious element of risk. Most crofters felt that with twice their present acreage and "souming" they would be faced with a less hopeless proposition.[6] This, of course, would involve a further, coerced reduction in population. But this is all a matter for future planning. What we want to know is the contribution of crofting to the local and national economy.

The Contribution of Crofting to the Economy

If we are to determine the value of agricultural production from crofting, we must consider not only the crops and 231 241 651 657

[6] It is not only the Skyemen who want more land; see The Report of the Commission of Enquiry into Crofting Conditions (Edinburgh: Her Majesty's Stationery Office, 1954), pp.18-19.

The maximum is harder to determine, economically. There is some limit to the number who can stock a common grazing with individually owned stock without becoming involved in complicated entanglements over right, obligations, and questions of ownership. The few townships containing more than thirty crofts in the Western Highlands (91 out of 957),[13] and the negligible number on Skye (only ten), suggests that less than thirty holdings per township, no matter how much fertile land surrounds the cluster, has been found to be the optimum. Most of the townships contain between five and twenty crofts. The fact that many large, adjacent townships, such as Bornesketaig in Kilmuir and all those in the Braes, are losing their population is a reflection of a many faceted condition we have been exploring throughout this chapter--the vast majority of the crofts are too small to provide an adequate livelihood. One of the primary causes for this state of affairs would seem to be overcrowding on the land.

<u>Congestion</u>. In almost all but the recently established or replanned townships, congestion is a legacy of the increase in population during the first century of the modern period, often aggravated by coerced subdivision during the period of the "Clearances." Because of this, over-all statistics have little meaning. It is quite correct to say there are some 2300 crofts on Skye and approximately 2200 crofters, but this does not mean each family has a croft to itself. To take

---

[13] <u>Ibid</u>., table 1.

extreme examples, Bornesketaig in Kilmuir consists of 47 crofts held by 35 crofters, but Aird in Sleat has 39 crofters who rent 20 crofts. In one badly subdivided township, Calligary in Sleat, one holding is held in the following shares: four men each have five-twenty-fourths, one has one-sixth, and one has "a part." The whole, indeed, is more than the sum of its parts. Moreover, townships with a balance of crofts and crofters, and even those with fewer crofters than crofts, often show the effects of subdivision. Another Kilmuir township, Herbusta, is laid out in eight holdings. Although there are an equal number of landholders, several of the crofts are divided into half shares. Then, there is Kilvaxter, also a Kilmuir township, with 11 tenants and 12 crofts; one man has three full shares while two others have only half a croft each. Multiple crofts are not necessarily adjacent. Some crofters hold land in two different townships. One of my informants rents two crofts separated by over twenty miles. On foot, it takes him two days to make the trip between his two holdings.

Subdivision, frequently carried to its ludicrous extreme, is not a problem confined to the Highlands of Scotland. All over Europe the traditional laws of succession have had a similar result. In consequence, the governments of all European countries have been striving to initiate reform. Generally, the aim has been to consolidate scattered patches, but almost always the schemes have become more comprehensive, attempting to create economic farms and increase productivity. Since the

where the population has suffered the greatest decline and, therefore, where enlargements, by legal or illegal means, have been the most extensive, crop production has declined the most. Nor has the decline in population, accompanied by land redistribution, altered the fundamental problem.

The cottars (subtenants) have almost disappeared thereby easing the excessive pressure on the land and removing the threat of recurring destitution. Today they are found only in a few scattered dwellings and isolated clusters. Most of them have secured some form of employment or have reached the age when a government pension is sufficient to satisfy their needs. The number of crofters, on the other hand, has increased. If the figures 2043 and 1227 can be accepted as nearly correct for the respective numbers of crofters and cottars in 1886,[15] they have increased at the expense of the latter and, also, the sheep farmer, whom they have replaced.

To briefly summarize the foregoing discussion of the township, let us look at Kilmuir. Table 3 shows the number of crofts and crofters in each of the nine townships together with the acreage and "souming" rights available to each individual. Although replanning during the past fifty years has benefited many of the local residents, crowding upon the land is still apparent.

from the ways handed down from the past. We might note at time that even the progressive crofter is not always quite rapport with modern techniques. There was, for example, a with two calves infested with liver fluke. Convinced that medicine was the only solution, and equally convinced that person cannot believe everything he reads, he obtained a bo of liver fluke medicine which was plainly marked: "for shee only." When asked how his calves responded to the treatmen he responded, "Och, they both died."

Because of the restrictions which the township system imposes, there has been a growing, perceptible rumble of agitation for supplanting unanimous consent with majority r Few, however, would go as far as a retired seaman who retur to Skye after forty years. He would like to see the townsh system abolished. Another small group believe the Sgiathan would be better off if the Island were given over to commun farms. Most seem to favor the continuation of the present system. Of course, the majority is composed of the conserva tive old men.

The Aged and the Absentee Crofter

No appraisal of the crofting system is complete withou a discussion of two additional factors which have affected use of the land and the present unsatisfactory economic cond of the Island. One of the factors is the aged tenant, who, as we have just seen, exercises a strong control over the younger men through township government. He has also influe

CHAPTER V

THE ISLANDERS' ECONOMY

The basis of the local economy, in terms of the contribution of the Sgiathanach to the national economy and the number who depend on the land for all or part of their livelihood, is the crofting system. We must, therefore, explore the economic aspects of this cultural pattern in detail. As a system of land use and tenure, crofting is an anachronistic survival in Western Europe. Elsewhere, the medieval agrarian systems have been repatterned along four principal lines.[1] In central and some parts of northern Europe peasant proprietorship became the characteristic feature. In southern Europe the métayer, a peasant who paid a rent plus a share of his crop, appeared. Northern Europe became an area of large farms. In England and Lowland Scotland tenant farmers received most of the land. There is only one survival of the old open field village farm in England.[2] Despite individual efforts of Highland landlords to bring about at least a partial assimilation of the increasingly backward economic patterns with those of rural Britain, crofting has been perpetuated. Certainly, the legal enactment of 1886 helped to

[1]Barnes, The History of Western Civilization, Vol. I, p.636.

[2]Lewis and Maude, The English Middle Classes, pp. 169-170.

restore it from the throes of disintegration, but even more important was the disinclination of the people to accept any fundamental changes. Indeed, only the following three features essential to crofting distinguish the system from that characteristic during the days of the clan: (1) individual arable land held in compact, permanent plots rather than dispersed and shifting cultivated strips, (2) the payment of a money rent rather than providing services and a share in the produce to the landlord, and (3) legal protection of the tenant from the potential abuses by the proprietor or an intermediary.

The Croft

Land Tenure. The majority of Skye crofters rent a small acreage of arable and improved grass land from a landlord or the Department of Agriculture for Scotland. Although the crofters pay an annual rent, their rather unique form of tenure, granted under the Crofters' Act of 1886 and subsequent legislation, confers upon them almost all the rights of land ownership with few of the responsibilities. The crofter has security of tenure, the right to bequeath his land to a member of his family, and relative freedom in deciding what use shall be made of the croft. His nominal rent very often has not been increased since the time of the Crofters Commission. Even where the Land Court has revised the rents, they are not substantially higher than those set at the turn of the century. If his rent is nominal, his taxes are negligible. In Scotland property tax is paid in equal shares by the owner and occupier. Thus, as an occupier, the

427 651 crofter pays only half of the assessment, which is based on rental value, and he is granted an additional benefit by having the land devalued seven-eighths for purposes of taxation. The majority pay £3 a year, or less, in rent, and, with a rateable value of 5s, or less, between 1s and 2s in taxes annually. Many pay no taxes.

427 342 423 On his small plot of land the crofter has his cottage. Here we find another rather unique interpretation of the laws of land tenure. Although the crofter is an occupier of the land, he is the owner of his dwelling. If he or one of his ancestors did not build the house, frequently with a grant and/or loan from the government, he will have paid "compensation" to his landlord for the dwelling upon accepting occupancy. Should he, at any time, relinquish his right to the croft, the crofter, in turn, will be entitled to full "compensation" for the value of the improvements on the holding as determined by the Land Court. The crofter's home is not entered on the county valuation roll and, therefore, is not subject to assessment.

427 241 233 In addition to the land under crops and improved grass, the crofter's rent entitles him to a share in the unimproved township grazing lands which are held in common and used under [628] [629] a system of allocation known as "souming." In each township, the collection of individual holdings, the crofters elect a grazing clerk and committee. They determine the number of cattle, sheep, and horses the individual is allowed to put out to graze. Usually each crofter has an equal share, but in

some townships the large crofter is given an allocation in proportion to his rent. The payment of his rent also entitles the crofter to gather seaweed along the coast for fertilizer and to cut peat for fuel on the common grazing or in special peat areas. In a number of townships he has a further right to pasture his rams in a "tup park" and his horses in a "horse park." These are lowlying areas of improved pasture. There is the general picture. 427 241 [233] [222] [314] [233]

There are three important exceptions to the typical means of land tenure. First, there are the Glendale crofters who own their land. Each individual has purchased his croft, and the members of each township own the common grazing collectively. Before the law they are no longer entitled to the [654] benefits of crofting status because, by legal definition, the crofter is a small farmer who rents his land. Second, there [233] are the crofters of six Kilmuir townships who have individual areas of "outrun," good lowlying cattle pastures, in addition to the normal crofter's holding. Even though the Glendale crofters are landowners and the Kilmuir crofters have their own cattle pasture, they are subject to "souming" regulations. Third, there are a few large, isolated crofts which are self-contained units. The individual has his own cultivated land, pasture, and rough grazing. In reality, many of these large holdings are farms, but as long as the annual rent does not exceed £50, the benefits of crofting status are not withdrawn. The crofter, of course, stocks his holding as he thinks best. While the Irish and Scottish Highland systems of land use 427 423 421

427 887 231 829 "rich man, the government." Since subsidies depend on the number of stock, he may forget that all or part of his "souming" has been given away. One old crofter, for example, a few years ago asked a young lady to fill out his agricultural return. She knew his estimates gave a great deal of reason to doubt his veracity, but, preferring not to question the point, she entered his figures. When it came time to sign the report, he was canny. "Och," he said, "just put a tremble in your hand and sign it yourself." There are other crofters who puzzle the authorities by returning the same number of cattle and sheep year after year. Although even the best crofters and farmers lose a few sheep and an occasional cow, they insist [629] that their stock has produced as many as have been sold. As a means of protecting the government from paying for non-existent stock, the police have to be notified when the annual stock counts are to be made. Even when they do supervise the counting, allowances for stragglers have to be made.

654 427 888 So pernicious is the effect of non-residence and decrepit crofts, that a recent government commission has recommended the severance of the house from the land in the case of the aged and the eviction of the absentee, as a means of bolstering the economy and alleviating the widespread condition of bad 427 888 husbandry.[17] This could be the final blow for the culture. Not uncommonly, the croft is subjected to both absenteeism and the infirmity of old age. The heir does not return until he has passed the age of retirement and begins to think, "It would be

[17] Report of the Commission of Enquiry into Crofting Conditions, pp. 42-43, 46-47, cb.

427 888 fine to go home to Skye to die." I might add, "and to live on a pension."

427 423 It is not only the tenant crofters who are non-resident. About 20 percent of the owner-occupiers in Glendale are non-resident. Only two townships have no derelict crofts. Those who have sublet their homes and land have an additional problem. Apparently unaware of the full implications of the Small Landholders legislation, they have received a rude awakening. The people whom they thought were their subtenants are, in the eyes of the Land Court, crofters entitled to security of tenure.

511 427 One reason for absenteeism, as for emigration, is a felt need for a higher standard of living than the croft can [178] provide. This desire, common to almost all European peasants, as well as American farmers, has assumed increasing importance with the extension of communication and education. The outstanding exception in Europe is Italy. There the métayer population has increased markedly since World War I. Today 92 percent in the métayer category have a substandard livelihood, judged in terms of sheer necessity.[18] Only 800,000 families out of 5,000,000 have enough land to meet subsistence needs. The difference between the European peasant and the American farmer is that the American lacks any traditional

[18] Information from the files of the Italian Statistical Institute, as reported in the Glasgow Herald, Feb. 22, 1954.

511 attachment to the land, or his attachment is not strong enough
427 to offset his desire for material rewards.[19] Regionally, a possible exception in the United States is to be found in the Southern Appalachians, where the majority have a net annual income of less than $500.00.[20] These mountaineers, significantly, are largely of Irish and Scottish derivation.[21] The Skyeman who leaves in his youth returns in his old age, if he can. We may logically ask what opportunities exist on the island for employment which might enable the Sgiathanach to raise his standard of living without forsaking the land.

Fishing

226 Fishing, it will be remembered, was once a traditional
181 and functional activity in the economic cycle of the Sgiathanach, but as far as the Skyeman was concerned, it was no more than a supplement to crofting. It was fine to be able to bring home some fish to be smoked or salted for the winter. The wages earned as a hand on an east coast vessel during the summer months were also welcome. Beyond this, he did not care to become involved with the sea as an occupation. His attachment to the land was too strong.

[21] Campbell, The Southern Highlander and His Homeland.

I hardly need to add after our discussion of the islanders' 582
economy that the chances of a young couple finding a vacant 427
croft are slim. It may be of interest to indicate just how slim they really are. In 1953-54, in 82 townships, which I visited, there were only eight vacancies. Six of these were no larger than cottars' gardens. There were no vacant holdings in Kilmuir or Glendale. I am not talking about derelict crofts in the hands of absentees. Moreover, if the individual decides that 464
working in Portree is better than leaving the island, his 582
prospects are no better. The County Council had sixty-six units 362
in a public housing scheme under construction, in 1953, in addition to fifty-six completed since the end of World War II. There were three applicants for each apartment. The county sanitary engineer, who was responsible for allocating the apartments, began to think half the population of Portree was dying, and the other half was dead. In order to get priority, the people were claiming disabilities, "some of them with names as long as your arm." Many of the people, especially young people, regard winning out in the competition as an indication of status. But we are getting away from the croft. We still have to consider how a person gets possession of the croft.

As we know, the crofter has the right to bequeath his 427
croft to a member of his family; however, he seldom bothers 428
to exercise his right. Here is another example of their incomplete adaptation to the higher socio-cultural level. The land and the house have very little monetary value. Usually, the man who leaves a will has been talked into it by an officer of the Department of Agriculture. He, then, assigns

the economy by subjecting many fertile acres to disuse because of his infirmity. The other factor is the absentee tenant, an individual who has obtained possession of a croft, normally by inheritance, but who has failed to take up his inalienable rights of tenancy. Let us very briefly review the economic trends of the last fifty odd years and, then, try to assess the importance of the absent and the aged.

Although the Sgiathanach has refused to become a specialist, fully involved in a money economy, he has become increasingly dependent on the products of the wider commercial society. Long ago he gave up growing the old staples, barley and oats. Not for many years has he grown enough potatoes or turnips to feed himself and his cattle. In place of these home grown subsistence crops, he now imports a great deal of his food. In an average year Skye imports over 700 tons of bread, 10 tons of vegetables, 300 tons of canned goods, 300 tons of potatoes, 500 tons of flour, and 100 tons of milk. To pay for these products, he exports cattle, once his only marketable produce, and an ever increasing number of sheep.

Hance, writing about the Outer Hebrides, sees the growing tendency of the crofters to buy their food as indicative of an increasing cash income.[16] To a certain extent, this may be true. There are, however, additional factors involved. Ecological limitations have played their role. That the climate and soil together make Skye a grassland suitable for stock breeding rather than an island fit for cultivation is an often repeated

problem are the few
state there are
fters. Only thirty

427 241 162 of the holders reside on their land for more than half the year. The lowest rate of absenteeism is found among the tenants of the Department of Agriculture. There are 76 absentees out of a total of 667 tenants. Most of the non-resident crofters are permanently absent. On the small estate mentioned above thirty-seven of the forty-two absentees have not been seen in years. Five of them usually return to Skye to spend their summer vacation.

427 241 311 887 Thus, we have a situation in which, perhaps, a third of the crofts are held by people who either cannot work them because of old age or infirmity, or do not choose to work them because of greater opportunities elsewhere. What, then, happens to this land? Some of the old people allow a neighbor to use the land. Almost invariably this means the few fertile acres will be used for grass and hay. Absentees "entrust" the [671] croft, house and land, to a landless family. While Parliament inadvertently gave the crofter a right to keep his holding whether he resided on it or not, it is illegal to sublet. So far, this has not concerned the crofters. Other absentees "entrust" the land to someone in the township who uses it for grass.

427 887 231 Turning to the influence of old age and absenteeism on stocking, we find a series of entanglements. If the township is inhabited solely by old people, like Aird in Sleat, the township becomes derelict. More commonly, the absentee and the old person allows someone else to take over his "souming" so [829] that some crofters have far more than their share. Not infrequently, this gives the crofter a chance to outwit that

427 428 his croft to his eldest son. Some reformers feel that the youngest son or daughter who has stayed at home to care for his parents is cheated. When there is no will, the State steps in and assigns the croft to the widow, the eldest son, or the child who has remained behind.

657 745 593 The growth of the welfare state has had its influence in determining this pattern. On the one hand, there are payments to unmarried children who remain at home to look after their parents. On the other hand, there are the old age pensions. While the pension has made the transition of the old couple from active crofters and parents to grandparents easier for the Irish small farmer,[13] on Skye the coming of the pension saw the end of the old pattern of the oldest son returning, with his wife, to care for his parents and raise his own family. With a pension the old couple had little need to work the croft. The children were not needed, and not infrequently the old people enjoyed their independence and their freedom from turning the house over to a woman whose ideas and beliefs conflicted with their own. The common desire of parents today is that one of their children will stay on to take over or return after they are gone. Naturally, no one likes to see his children far from home, but what can they do?

582 Aside from the difficulties of inheriting a croft or finding a vacant holding, it has become increasingly difficult for a young man to find a wife. Most of the crofters' daughters

[13] Arensberg, op. cit., pp. 85-86; Arensberg and Kimball, op. cit., p. 125.

605 592 spouses not too long ago.[23] Perhaps, more than any other 427 factor, it is the tendency of the aged parents to hold on 593 602 to the croft until they die that is strangling the kinship system. Still the extended family is a strong mutual aid 596 602 579 group. Anyone with a recognized degree of kinship is entitled to hospitality. When the exiles return to visit the Misty Isle, they always try to make the rounds of their kinsmen. This is more than a question of not becoming an economic burden on a favorite aunt; they do not want to be guilty of slighting anyone. There is reciprocity here. 202 In return for food and shelter, the visitor freely gives his kinsman all the news he has gathered about the activities of their distant kin. He acts like a roving reporter, cementing the solidarity of an otherwise fragmented group.

602 764 The expression given to the degree of consanguinity and affinity is revealed most completely at a funeral. As one of the two occasions on which the extended family comes together, the other being a wedding, it reveals a host of significant traits. The first thing I noticed was that although the inavailability of land and the illegality of subdivision enforces neo-local post marital residence, burial is ideally patrilocal. On more than one occasion the steamer came in at night with a body which had been shipped home from Glasgow or 602 Edinburgh for interment in the deceased's neighborhood. This 593 also means that the husband and wife remain integral members of their respective families. The founding of a family of

[23] Morgan MacLeod, Reminiscences of a Highland Parish, p. 196

Beginning with a population which is believed to have been 161 relatively stable due to recurrent crises, including epidemics, famines, and wars, the pendulum of population growth and decline for the Sgiathanach has been found to be highly responsive to cultural innovations and social adjustments. Between 1750 and 1841 the Skyemen increased in numbers from 10,671 to 23,074, an increase of more than 100 percent. From 1851 to 1951 the population has steadily decreased from 22,536 to 8,603, a decrease of 62 percent from maximum. Associated with the 161 decline were changes in the age structure. In 1861 34 percent 162 of the population was under fifteen and only seven percent was over sixty-five; today only 22 percent of the population is under fifteen while 19 percent is over sixty-five. How can we account for these changes, or, more correctly, how can we account for the changes in the birth, death, and emigration rates?

Broadly speaking, the increase was favored by the direct 161 and indirect involvement of the Sgiathanach in the process 175 of commercialization, with all of its associated consequences. 178 One by one, the natural checks on population growth declined in importance. The pressure on the means of subsistence was eased. The former clan chiefs, preferring the society of Edinburgh and London, absented themselves. After converting 161 rents from kind to money, they provoked the withdrawal of the 175 tacksmen by resorting to rackrenting. The former clansmen, 178 who became joint-tenants, received a larger share in the land 427 and were freed from the obligation of feeding both their own families and those of the superiors. At the same time the

The growth of the population ended with a prolonged famine. 161 The proprietors, finding that the people's only justification 731 for crowding the estates and looking to their landlords for 427 help were some nebulous customary usages, facilitated the decline by disregarding custom and throwing as much land into sheep farming as was possible. While evictions were not new, 427 only after the famine did they result in an absolute reduction in numbers. The Sgiathanach, fettered by a lack of capital 182 and an inability to break with the past, could not make the final adjustment required by the process of commercialization, specialization. In addition to emigration, the Clearances 167 and general economic hardship forced a postponement of 582 marriage. There was neither land nor regular employment to 464 provide a livelihood.

Later in the nineteenth century new influences began 161 to play a role in the continuing decline of the population. 167 Following the passage of the Crofters' Act, the nature of 178 emigration changed. Seasonal migration became negligible. 427 The provisions of the Act, and ensuing legislation, made it 671 possible for a man to remain away during his active years and return to the parental croft to spend his old age. The ex- 871 tention of education not only equipped the youth for life in the larger society but also created demands for objectives which could not be attained at home under the existing order. Thus, as in the period of population growth, the persistence of 161 many features of the old traditional culture, and the renewed 167 importance of others, were factors of no little consequence. 182

I were to adapt this argument, I might even be convincing, but 178 my dissertation would have a fallacious conclusion. Emphatically, 182 irreparable cultural disorganization is not a characteristic of the culture history of Skye.

Continuity has been maintained through a reintegration. 178 In part, Skye has made an adjustment to the higher socio-cultural 182 organization of Great Britain and Western Civilization. This phase of the culture's readaptation, however, is an incomplete adjustment. The Sgiathanach has remained enisled geographically and culturally. A readaptation has also been made in the older, traditional culture.

The national culture has played no insignificant role in 178 the readaptation. Parliament turned back the process of com- 182 mercialization in 1886 and undertook to rechannel the trends 423 toward ever increasing commercialization of the land, ulti- 427 mately leading to the socialization of the land. The essentials of 657 the old system of land use and tenure were not only reaffirmed but also given legal sanction to insure their stability. The nation confirmed the customary usages. In many townships and in whole neighborhoods the crofting system was restored. As far as the Sgiathanach is concerned, he has never known any other economic structure than communal use and tenure of the land. There are only three significant differences between the runrig farm, whether the farm was a tacksman's or the common holding of several joint-tenants, and the crofting township. The arable acreage is held in compact, permanent blocks instead of dispersed and shifting strips; the crofter pays a money rent in place of goods in kind and services; and national laws

of tenure function to protect the individual from potential 178
abuses by a landlord where customary usages once fulfilled the 182
need. Moreover, even though the tenure of the cultivated soil 423 427
grants all the rights of a landholder, including the rights 657
to bequeath the house and land to a member of one's family,
for more than half the year it is used communally.

The Sgriathanach has never adjusted sufficiently to become 178
a specialist, not even a specialized grazier. For him the 423
land has always had a more fundamental value than merely being
a means of livelihood. It is the ancestral home. There is a
sentimental attachment to the land which is an expression of
the affectionate bonds of kinship. The people have never lost
the tribal tie of the land and the group. Although the former
patriarchs disclaimed any sympathy with this point of view,
the landlords on Skye today have kept what little land they
have only because of its sentimental value. Indeed the atti- [656]
tude of the largest landholder, the government of Scotland,
is that the crofting tradition is worth while preserving, if
for no other reason, because in the predominantly urban and
industrial civilization it has a romantic value. There are
other reasons. The Islands have long been looked upon as a [702]
human reservoir for the armed forces, and, more recently, for [464]
Lowland industry.

As a result of their partial adjustment to the higher 178
socio-cultural level, there have been changes in crops and stock 231 241
The British market has influenced the crofters' output, within 433
ecological limitations. The old subsistence crops of oats and

311 There are 144 crofts in the village (nine of
241 which, in South Shawbost, were added after the turn of
[175] the century by non-crofters encamped on common grazing
[420] land who applied to the landlord for crofter status).
Thirty-four (almost a quarter) of these crofts are
vacant; that is, the holders of the crofts live else-
[527] where. One of the vacant crofts is used by its absentee
[493] tenant for holidays, and one sports a trailer (called
[485] a "caravan" in Britain) which may be rented to tourists
during the summer. The rest are cultivated or used for
[428] grazing by crofters or non-crofters in the village who
[427] by inheritance or by formal or informal subletting have
gained use of the land.

241 A little over half of the crofts are worked as
individual units; 44% of the crofts are worked as
combined units of two and three. Twenty-four men have
the use of two crofts each, and five men the use of three
crofts each.

16 A feature of crofting townships usually emphasized
is their disproportionately large number of aged people
and small number of young people, who tend to migrate
to the cities. An age-sex "population pyramid" of the
Highlands is not a pyramid but a top-heavy hourglass
(see Table I).* Most persons of child-bearing age have
migrated from the area and the number of children is
*[See p.vii--Analyst]

264 The only occasions on which it is customary to feed
574 someone an entire meal is at a work party, such as peat-
576 cutting. On such occasions the preparation of meals is
[461] done in an atmosphere of competition and mutual scrutiny,
[476] and the meals are often elaborate. At other times, the
requirements of etiquette can be minimally fulfilled by
giving foods which are still relatively abundant, but
which were much more abundant when the land was cultivated
[242] and cows kept. Such foods are barley bread, oatcakes,
clotted sour milk, cream and fresh butter. These foods
264 are usually offered to visitors along with tea, and in the
57 past this custom served to minimize the economic disparities
574 between villagers, to spread scarce resources. A similar
[737] function was served by the practice of giving part of
[431] each catch of fish to old widows and other villagers in
need of aid. Even though food is more abundant and diverse
today, the taking of tea, and especially food, during a
visit is still very important.

173 A 50-year-old man who "married into" a croft recalls,
[581] "I came from a family of ten children. Everyone had to
[428] leave, or marry a girl with a croft. Only the eldest son
could inherit the croft." There was little room for
422 romanticism in the fight for scarce land among the sons
581 of large crofter and non-crofter families. "The most

592 unmarried sibling. Eleven households consist only of
siblings who have never married, men and women who in
1971 were 45 years old or older. Two widows live with
[589] their unmarried siblings. Sixteen widows or widowers
live alone, and sixteen unmarried persons live alone.

241 The large number of households occupied by single,
592 elderly people reflects the use of the croft as a place
423 of residence rather than as an agricultural unit, a
671 view of the croft that was given legal expression in
888 1968 by the Miscellaneous Provisions Act. Before 1968,
[423] the croft went automatically to the eldest son if a
crofter died intestate. Since 1968, the rights of
different claimants must be considered and tenancy by
a new person must be confirmed. District and county
councillors argued for this change, saying that a widow
was often left on the croft and her security endangered
because the eldest son was usually far away from the
island, in Canada or some other country. In other words,
rather than an agricultural unit which should naturally
be taken over and worked by the male head of the house-
hold, the croft is seen as a place of residence for
the infirm and for the aged, and especially for the aged
female.

659 The Crofters Commission has suggested that elderly
185 people be allowed to rent small plots of land on which
423
888

to notice the absorption or suppression of rights held in common in 'the North and West', together with the abolition of the duties of fellow-workers to one another. Too frequently they have not troubled to enquire into the former existence of common rights and fellowship duties, the observances of which have so much to teach. Yet to judge from the completeness of the Hebridean evidence, and from wider evidence to be touched upon with reference to Norse and Lowland conditions, suppression caused a profound social and moral revolution.

Indeed, the profound character of that revolution makes it hard to recognise the common origin of features which may differ greatly today. To choose four examples, the long succession from father to son, found from end to end of an Island township, contrasts with a restless movement of farm servants, and even tenant-farmers, all too common until 1939 in Lowland Scotland and parts of Northern England. The ideals held by fellow-workers in Gaelic tradition, of kindly and courteous co-operation, contrast with the avowals of rugged individualism made on many a farm even of the southern Highlands today, and certainly of the Scottish Lowlands and Northern England. Languages have changed as English has advanced during 1500 years: the Lewis crofters' children still speak Gaelic, but children in Stornoway ceased to do so forty or fifty years ago. And in the recorded religious life of Gaelic hamlets far from any priest (or later, minister), the part of revered men and women is very different from the part played in Calvinism by the Minister and the male Elders of the Kirk. All these four contrasts are due to revolutionary changes in home, work, language and religion. Such changes, of which all trace may be lost elsewhere, are traceable from the fullest evidence among the Gael.

Harris; South Harris is ringed by a road, extended recently to take in the more isolated 'Bays' townships.

2. *The Crofts and Crofting Ways*

The prevailing modern unit of cultivation and tenure in the Islands is the croft, the land held individually by each small landholder or 'crofter'. The Anglo-Scottish term croft (Gaelicised as *croit*) meant steadily cropped, infield land, manured and never left fallow, and distinguished from the unmanured outfield with its long fallows and poor out-turn. This term came into common use in the Highlands and Isles in the eighteenth and nineteenth centuries with the splitting up of the older unit of cultivation and tenure, the small joint farm, with its little team of fellow-workers or 'small tenants'. By 1830 group tenure had been replaced by individual holding of crofts, but with the pasture still held in common, as it is to the present day, and an allotted strip of the machar.

The Lewis croft consists of a nominal five acres of crops, of oats, barley (or bere) and potatoes, sometimes with recent additions of turnips, and more often a small hay crop. The word 'nominal' is used because during the nineteenth century the croft had often been subdivided between two or more sons, without addition by reclamation to bring each subdivision up to the acreage of the original croft. Moreover, in the hilly southern part of the Island, cultivation is in little patches instead of in continuous fields. There, narrow ditches have been dug and the soil heaped up to form little ridges about ten feet by four, banked up by turf. These are known as *feannagan* in Gaelic, or in English, 'lazy-beds'—a term in use as early as the time of Burt, two hundred years ago. Thus only about two-

175 growing family could increase the size of his holding. Secondly, in the absence of fences
427 a certain discipline of agricultural management had to be maintained; moreover the
311 proprietor, through the factor, grounds officers and township constables, saw to it that
632 it was. This "good husbandry", albeit at a rather low level, was maintained in the interests of tenants and land-owner alike. After the arable land was lotted permanently to individuals, there was less flixibility and less need for communal management. But the absence of fences between the new lots, or crofts, meant that they were still common land during the winter months. In some cases the proprietors paid the tenants to erect fences round the newly lotted inbye land of the whole township but, even when a ring fence existed, stock was allowed to graze indiscriminately within it from November until April.

It is fortunate that the first Ordnance surveyors were at work in Lewis just as the lotting was coming into effect. The new lots were not divided by fences, therefore they were not marked by the surveyors, but in several townships they arrived in time to plot the clachans and in some - Breasclete, for example (fig. 6) - the first edition six-inch maps show some of the new houses, neatly spaced out on the new lots. The arrangement of the latter is recorded in the Factor's sketch books, of which fig. 7 is an example.

175 Thus whilst we have little evidence of the appearance of the former rural landscape,
632 we have an excellent record of the birth of the new. The characteristic units of the new
178 lotting were townships divided into long narrow strips, arranged parallel and fan-wise more or less in the direction of steepest slope. Such an arrangement was simple to lay out; it tended to give everyone a fair share of the land of each kind - ill-drained and well-drained, high and low. And, if a road or track passed through the township it was usually possible to give each lot or croft direct access to it without the necessity for side-roads.
[367] Consequently the houses, when re-built, were usually put on the crofts. A dispersed pattern of settlement replaced the little huddles of the clachans. The extent to which it was dispersed depended on the width of the lots; the greater the number of tenants to be accommodated in a given area, the narrower were the lots. In extreme cases they might be as little as 20-30 yards in width and then the houses, aligned along the road or access track might form a virtually continuous terrace or street.

CHAPTER THREE

THE CROFTING STRUCTURE

427 In the parish of Uig about 90% of the families are crofters. That is to say, they owe their presence in Uig to their hereditary tenancy of a small-holding of croft status. To these holdings they have a deep attachment; many of them have been inherited through
[428] several generations. Others were obtained more recently during the process of re-settlement of farm land which followed the Napier Commission report and 1886 Act. Many older crofters regard the resettled townships as the fruits of a hard-won victory. Nevertheless, we have seen, very few of the holdings are in fact more than 110 years
[166] old. And, whilst some families can certainly trace their ancestors in the district for several centuries, there has always been a good deal of movement between townships. Thus the claim that they occupy holdings which were carved out of the barren moor by the toil and sweat of their ancestors is, in most cases, metaphor rather than strict truth.

I hardly need to add after our discussion of the isla
economy that the chances of a young couple finding a vacant
croft are slim. It may be of interest to indicate just how
they really are. In 1953-54, in 82 townships, which I visi
there were only eight vacancies. Six of these were no larg
than cottars' gardens. There were no vacant holdings in Ki
or Glendale. I am not talking about derelict crofts in the
hands of absentees. Moreover, if the individual decides tha
working in Portree is better than leaving the island, his
prospects are no better. The County Council had sixty-six
in a public housing scheme under construction, in 1953, in
addition to fifty-six completed since the end of World War
There were three applicants for each apartment. The county
sanitary engineer, who was responsible for allocating the a-
partments, began to think half the population of Portree was
dying, and the other half was dead. In order to get priorit
the people were claiming disabilities, "some of them with na
as long as your arm." Many of the people, especially young
people, regard winning out in the competition as an indicati
of status. But we are getting away from the croft. We stil
have to consider how a person gets possession of the croft.

As we know, the crofter has the right to bequeath his
croft to a member of his family; however, he seldom bothers
to exercise his right. Here is another example of their
incomplete adaptation to the higher socio-cultural level. Th
land and the house have very little monetary value. Usually
the man who leaves a will has been talked into it by an
officer of the Department of Agriculture. He, then, assigns

AGRICULTURE AND FISHING

This lack of a local fleet fishing in the Minch and associated waters on a full-time basis has inevitably brought reluctance on the part of Government bodies to invest capital in, say, harbour improvements, knowing that they would fail to yield an eventual return. Just after the first world war Lord Leverhulme formulated ambitious plans for a full-time fishing fleet based on Stornoway. More than thirty years later, in 1954, the Taylor Commission, set up to investigate the problems of crofting, summed up:

> Gone are the days when the crew of the fishing boat could haul up their craft on the beach and leave it there in safety. The modern seine-netter is much too heavy to be beached in that way and far too costly to be exposed to risk in unsafe anchorages . . . The capital outlay required for their purchase is such that it is not possible to operate them except on a full-time basis. It is still possible for smaller boats to be employed in fishing for lobster or crab, but the general trend of development is against the man who combines fishing with the work of the croft. We do not think it possible to reverse this trend; it should be accepted and an attempt made to establish a full-time fishing industry in Western waters.

The first vital step to do just this was taken in January 1959 when the MacAulay (Rhodesia) Trust announced the introduction of a scheme to 'increase the number of modern boats with efficient crews operating from or based on Lewis'. This Trust was set up under the will of the late Murdo MacAulay of Ness, who left Lewis with little English, less money, but plenty of Gaelic and enterprising spirit, to acquire a considerable fortune in Rhodesia. He bequeathed the bulk of it to be applied for the good of his island home. Anyone applying for assistance under the scheme was required to give an undertaking that he would prosecute fishing on a full-time basis; further, no one would be assisted unless, in the opinion of the trustees, he was likely to make 'an energetic and successful fisherman'. This pioneering venture directly assisted three young men in Kirkibost, Bernera, to acquire one of the best-equipped lobster boats in Scotland; and secondly it acted as a useful prototype for the Government scheme which was to augment and largely replace it a year later. In January 1960 the Government officially instituted the Outer Hebrides Fisheries Training Scheme. Free training was offered to men pre-

[TEXT CONTINUED ON PAGE 109]

Lewis and Harris

sold, one such causing legal history. The chief garage proprietor 175*
in the town applied to use for his business a site he had purchased 632
at a road junction near the western end of the town, close to the 429
principal new housing schemes and opposite the main gate lead- 175*
ing into the Castle grounds. It was a mistake in planning, and 632
public disapproval began to make itself felt. The Trust, in an 429
effort to redress the situation, sought to distrain the garage pro- 691
prietor from extended use of the area. The parties went to law,
and the case was fought through the courts until, in the House
of Lords, the Trust finally lost and had to pay a bill of some
£4,000, equivalent to a fine of £4 to £5 from every family in
the burgh. The Trust drew its lesson, and since has formulated a
more alert and constructive policy.

The town is well served by its shopping centre, with multiple 632
stores jostling for custom with smaller private business concerns. 366
Prosperity for all, however, depends on the well-being of the Harris
Tweed industry. If there are recessions, as there have been in the
past, the tills rattle spasmodically. Also standing to suffer are others [365]
such as the bus companies (who provide the efficient town ser-
vices and link up Stornoway with the rural areas), the builders
and the haulage contractors. In the ever-present climate of un- [464]
employment it is the policy of the mills to employ male labour, [462]
despite the fact that women would be cheaper. The mills, run
by natives or by Lewis-born incomers of the second and third
generation, realise a social obligation in recognising that in Lewis
the strong tradition is that the man should be the head of the
family in every sense. The mills also carry a proportion of surplus [466]
labour to offset the unpredictability of those workers who, with
crofts to look after, occasionally have to take a day off 'at the
peats' or some such activity. This is another of the island's dis-
tinctive traditions.

On Cromwell Street is the shop of James MacKenzie & Sons 366
Limited, dealing in hardware, furniture and china. Nothing un- 632
usual in that, at first sight: yet it is another unique aspect of life 747
in Lewis, being conducted as a charity for the benefit of, among
others, the aged and infirm persons of Stornoway. The business
was established in 1830, on its present site. In 1964, the then [429]
principal shareholder presented the building and the business as a

STORNOWAY

366 going concern to a trust which was set up to receive the gift and
632 whose first object is to assist aged and infirm residents in the
747 burgh. In effect, all profits earned by the shop are passed to the
429 trust for distribution to those in need.

Almost half the houses in Stornoway were built by the local
362 authority. The Town Council has never been afraid of rooting
632 out unfit houses. By 1937, under the 1930 Slum Clearance Act,
[175] one person in four in the town lived in a council house. The housing schemes, though large, have still that element of community with personality, something often lacking in newly developed
362 areas of other towns and cities. The Council also supports private
427 housing by taking up sites, clearing and servicing them and then
632 feuing them to private owners. The rents policy is to have no housing deficit beyond the statutory rate contribution (which works out at between £6,000 and £7,000 per annum). The Council's tenants co-operate with rent collection to a unique degree: collection figures are something like 99 per cent and on occasion 100
362 per cent. A vigorous housing policy is important to the town, as
128 its population is now over 5,300 and still growing, mainly at the
162 expense of the rural areas. Development plans at present envisage
161 a 1981 population of about 9,100 persons within the parish
632 boundary and including the burgh.

632 Stornoway is an island town and is an island's town:
369 its rhythms of life are those of the island, regular and timed by nature, but with an added syncopation—the result of an urban
632 outlook. In this context, Gaelic is the language, though English is
197 the lingua franca. Deeper still in the methods used for communication is a kind of patois based on Gaelicised English, Anglicised Gaelic, with some other words that defy investigation into their origin. Many words find their natural forebears in Scots, American and the maritime tongues of Europe, which might be expected in view of Stornoway's importance as a sea-port of significance a century or two ago. The Stornoway language, as spoken by true-born natives, recognisable anywhere by another native, reflects the life of the cosmopolitan, sea-faring people.

632 Apart from its industrial opportunities, Stornoway has many
871 of the more sophisticated urban facilities that people everywhere
[369] seem to crave, particularly with regard to education. The senior

FISHING

for the steamers, he thought that any improvements in connection with the fishing industry should be paid for largely by the fish-curers themselves—though he did spend about £1,000 on constructing fish-curing houses. Why Sir James, with his experience of business, should have taken this attitude is not clear; certainly the fishing industry could have been given just the right impetus with his interest, personal and financial. As it was, the industry was left to develop on its own lines, with odd injections from time to time.

228 175* [504]

Fluctuating prosperity

That the potential in the fishing grounds of the Minch was enormous was realised before 1850 by fish-curers from the Scottish mainland. But deep-sea-going boats were needed, and so new designs were called for. James Methven of Leith, a pioneer of deep-sea herring fishing, sank capital into the development of a large class of boats known as the 'Anstruther build', or in the islands as 'Eanstrach'. These craft served the islanders well, and Lewis prospered, as did Stornoway. In the five years 1870 to 1875, for example, the average number of barrels of herring cured at Stornoway for export was some 80,000. From 1875 to 1900 the average Stornoway district catch of white fish, much of it caught by local boats and some of it cured at Carloway, was worth over £100,000; it was sent to Ireland and the Clyde. After 1900, fresh-trawled fish replaced the cured and the market fell away. In 1921, the market value of cured fish from Stornoway was about £500, ½ per cent of the 1900 value.

[501] [401] 228 175* 43•

The herring fishing held its own, against the decline of the white fish. Stornoway, as Lochboisdale in the Southern Isles, became for a while one of the world's most important fishing ports. Prosperity was in the air; even when the fishings did eventually fall away, there still remained, decades later, the whiff of past success among the neglected curing sheds, the hangdown boats in the quays, and the silent kippering houses. From 1917 to 1935, the annual landings of herrings (in crans) varied from 25,486 (in 1934) to 221,519 (in 1927). In that year, a record one, it was reported that 'even landsmen could hear the roar of herrings in Loch Erisort. So dense were the shoals that their progress in the

264 574 576 [461] [476] The only occasions on which it is customary to feed someone an entire meal is at a work party, such as peat-cutting. On such occasions the preparation of meals is done in an atmosphere of competition and mutual scrutiny, and the meals are often elaborate. At other times, the requirements of etiquette can be minimally fulfilled by giving foods which are still relatively abundant, but which were much more abundant when the land was cultivated [262] and cows kept. Such foods are barley bread, oatcakes, clotted sour milk, cream and fresh butter. These foods 264 are usually offered to visitors along with tea, and in the 57 574 past this custom served to minimize the economic disparities between villagers, to spread scarce resources. A similar [939] function was served by the practice of giving part of • [431] each catch of fish to old widows and other villagers in need of aid. Even though food is more abundant and diverse today, the taking of tea, and especially food, during a visit is still very important.

173 A 50-year-old man who "married into" a croft recalls, [581] "I came from a family of ten children. Everyone had to [428] leave, or marry a girl with a croft. Only the eldest son could inherit the croft." There was little room for 423 581 romanticism in the fight for scarce land among the sons of large crofter and non-crofter families. "The most

574 584 on troubled waters," or bringing the two families together.[2]

585 The most important of the ceremonies surrounding marriage was not the church service (posadh) but the wedding dinner and dance following the church service (banais, from bean meaning "woman" or "wife," and feis meaning "feast").

"House weddings," as they were called, were held • [431] in the home of the bride. For several weeks beforehand, neighbors and relatives brought gifts to the bride's house, where they were displayed in a room set aside for them along with the dresses to be worn by the bride and

---

574 584 184 [2] Morag MacLeod of the School of Scottish Studies describes a custom still existing on the Isle of Scalpay off the Isle of Harris, called reiteach mor (big reiteach), in contrast with the reiteach bheag (small reiteach) or simple dinner party which existed until fairly recently on mainland Harris. The reiteach mor is a dramatic event involving a humorous exchange between male speakers for "the groom's side," and male spokesmen for "the bride's side." The bride is hidden, and the groom's men ask for the bride indirectly. They desire a sheep, perhaps, or a length of tweed. The desired object constitutes a theme which is developed in humorous give-and-take between the two sides, as various females are brought out one by one by the bride's people, from the most undesirable old maid to the bridesmaid and finally to the bride. Until the bride finally appears, the groom's spokesmen must find something wrong with each female presented, along the lines of the chosen theme. The sheep's fleece is not curly enough, and so on. The bride sits at the table after she appears, is given a glass of whiskey which she sips and then passes to her fiance, and the performance is over.

585 bridesmaid(s). The house was filled each night with
• [431] visitors bringing new gifts or coming to see the latest additions. Enough presents were given during this
[203] time to set up a household. Invitations to the wedding were issued verbally, by persons going around to each
[602] house. Anyone could come to the church ceremony, which was relatively informal and jovial, but only the "closest" relatives were invited to the sumptuous wedding dinner which followed the service: the bride and groom, their parents, aunts and uncles, first cousins and usually second cousins. Many more were invited to the wedding supper which started after the dinner, at about 10:00 p.m., and continued throughout the night.

Three main nights were distinguished, although
585 preparations and festivities might go on for weeks. The
252 first night was the night before the wedding, when women of the village brought hundreds of chickens, which they plucked and cooked. Meat, usually mutton, was also cooked and sliced. Butter was rolled into balls. Neighbors brought milk and other provisions and assisted in the baking for a week beforehand.

585 On the second night, hundreds of villagers ate the
[535] chickens and mutton prepared for the wedding supper,
[533] and danced to the music of a piper or other musicians.
[273] Many young boys had their first taste of beer or whiskey on these occasions.

585 on these occasions. At some point during the night the bride and groom were prepared for their wedding night together. The bride's female companions undressed her, prepared her for bed, and put her into the bed with a hot water bottle. She shared some sherry with them, and they went out, whereupon the groom was brought in by his male companions. After much joking the couple were left together.

[574] On the third night, a dinner was given for the older persons who had not been able to come to the "big" wedding.

[273] For some time after the wedding, the married couple
• [431] visited relatives and neighbors who had been unable to come to the wedding, taking a bottle of whiskey with them.

585 House weddings declined in number during the war when
178 food was rationed, and as more persons changed from the
[342] "black house" to the less easily cleaned and more
[485] elaborately furnished "white house." Most weddings are now held in hotels, and consist of a single wedding dinner and dance; they are often held on Thursdays, the day of the banais in the past. The emphasis on community participation still exists: even though the practice of holding hotel weddings has limited the number of guests, an effort is made to invite someone from each household in the neighborhood. In part to avoid disappointing the

585 In part to avoid disappointing the
178 vast number of relatives who by custom must be invited
[602] but for whom there is now not enough room, many weddings
• [431] are held away from the island in places such as Inverness and Glasgow. Gifts are still given in great numbers and displayed, despite the decrease in numbers attending the wedding dinner and the feeling that only those who are invited to the wedding should give presents. The
[202] custom still exists of neighborhoods or entire villages placing flags outside their homes on the day of a villager's wedding (except when the wedding is held away from the island); isolated flags within a village signify that the household is related to someone in a neighboring village who is getting married. And when the wedding car has picked up the bride and is leaving for the hotel in town, the road is often littered with barrels and other barriers.

Couples now often leave the wedding dinner and dance and go to undisclosed destinations for their honeymoon. But when they return to the community they must undergo a simple rite of passage that gives sanction to their new social status. On the first Sunday following their return, they are expected to come to church with the other members of the bridal party, a process called kirkadh (a slightly Gaelicized rendition of Scottish "kirking").

585 For some weeks after returning, the couple goes visiti
178 with a bottle. The scope of visits seems to have narro
to close relatives unable to attend the wedding, and sometimes the custom is referred to as old-fashioned.
• [431] The bride usually mails pieces of bridal cake to
[205] relatives who were unable to attend the wedding.

758 2. Death: At a time of illness or injury, an
574 individual may see persons he has not seen for years. The house is filled with a constant flow of visitors, and the visitors recount every detail of a sick person'
[763] pallor and movement. The room is usually occupied by visitors when a person breathes his last.

763 In the past, work ceased in every house in the
46 surrounding neighborhood when a person died. This no
[178] longer occurs. (The story is told of a weaver who call
[288] a mill in Stornoway to say that he could not finish an urgent tweed because there had been a death in the village, and was told, "You keep on weaving till the
[535] weaver dies.") However, dances in the village are
[444] cancelled, and the bothan (an isolated hut in which liquor is sold illegally) may close. Outdoor work, suc as peat-cutting, which would be widely seen is avoided.

763 Word of the death spreads throughout the village a
[203] beyond within a few hours. From an immense, accumulate inventory, memories of the deceased are brought out,

273 village locations such as hotels and bothans (see Chapter
[154] 6). Drinking situations provide an important opportunity for relatively uninhibited expression by males, and will be discussed further in Chapter 6.

522 The role of clown or "character" is well developed
156 in Hebridean townships. In an environment which encourages
154 quietly watchful and somewhat anxious, conformist behavior, the character is rude, raucous and outrageous, a bite of fire in cold waters. He represents a reversal of normal behavior. The villagers shake their heads, agree that he is impossible, but encourage him to continue, urge him on when he flags, and bring up his escapades for discussion during moments of boredom. There are usually several such characters in a village.

156 Reversal of low-profile and other "normal" behavior
154 is also allowed on particular occasions such as New Year's,
527 this time among all villagers. In the days of horses and
[522] carts, boys went around the village on New Year's night
[883] stealing carts and hiding them on the moor or down by the
[574] shore; today they steal gates. Between Christmas and
• [431] New Year's, groups of boys visit houses in their neighborhood, collecting tea, sugar, biscuits, or money to be used for a party in one of the houses. Such boys are called
796 balaich na bannagan, or boys of the bannag. In some
431 Gaelic-speaking areas, bannag refers to a gift that is
184

796 given at Christmas; in Lewis, Christmas is identified
• 431 with Catholicism, and is an insignificant event in
184 comparison with New Year. To give two examples, a New
527 Year's dance is given, but not a Christmas dance; and
796 the mills continue working on Christmas if it occurs
184 on a week day, but close for at least two days at New Year's. In Shawbost, bannag is defined as a party associated with Hogmanay (New Year's eve).

527 In the recent past, until about ten years ago,
292 the boys dressed in women's clothes or wore masks. They
178 took turns wearing a cow's skin as they went from house to house. In each house, the boy wearing the skin was
[539] hit by the others as he chanted the rann na bannag (rhyme of the bannag):

Here I come again renewing Christmas.
(Or, in another version: This is the New Year's night
I'll take the bread without the butter,
And the butter without the bread,
And the cheese by itself.
Then we won't be empty-handed.
One thing I refuse is a mangy potato.
It gives a heavy feeling.
It's not healthy.
If you don't give me my bit of butter and my lump of cheese,
Everything you possess will be gotten by the crows on St. Patrick's Day.

527 As the balaich na bannagan left the house in which
431 they had received gifts, they blessed it. All food and
178 money was given to the woman who prepared the bannag.
[788] Today children tend to receive money more often than food, and use some of the money to buy sweets at the post

527 office or general store, preferring to divide the rest
178 between themselves for use at a later time. A 50-year-
● 431 old woman observed, "They don't appreciate the bannag
like we used to. They get this kind of rich food all
527 the time." The practices of wearing costumes and speaking
178 the rhyme are disappearing. Children used to have the
bannag until they left school at age 14 or 15; now only
the younger children go. "Children grow up more quickly
today."

527 New Year's is celebrated perhaps most intensively
562 by the men, who after seeing the New Year in by watching
273 a special New Year's program on television go visiting
574 neighbors and relatives with bottles of whiskey. The
[184] custom of "first-footing" on New Year's eve is found
throughout Scotland; but in the Hebrides such visiting
and heavy drinking may last from New Year's eve until
the following Sunday. During this time, the woman of the
house, who usually refrains from drinking and to some
extent controls the drinking done by the males in her
house, relaxes her attitude, and may even participate.
The comment, "It's only once a year," is often heard.
[589] During this time, the shyest and most retiring bachelor
becomes a Romeo; this is the only time of year he may
be heard to mention the word marriage. For example, one
bachelor in his 60's chooses a "bride" each New Year, and
takes her with him on his all-night visiting.

273
571
156 a while. It would be an insult not to take a drink
[576] them; you musn't miss your round."

273 The usual practice when drinking with friends i
571 for one person to buy the drinks; everyone drinks
156 together, and then someone else buys the next round.
● 431 drink slowly is to indicate that you intend to miss y
round. A relative who returns to the island for a ho
usually pays for more rounds than he receives, and ma
spend as much as L80 in a single week.

If a man wants more drink than his fellows, he ha
several choices. He may step up the pace of drinking
buying more rounds, which means that he is likely to pa
a larger share than the others during the evening as th
will be ready to quit before he is; or he may keep a b
hidden outside the room, and disappear periodically for
private nip, after which he returns to the group.

273 As incomes have grown, excessive drinking, which wa
571 once confined to a small number of occasions, has also
156 increased. In the days when money was scarce, people sh
178 with others what they had. Elaborate and relatively lav
434 ceremonies in which all community members participated
were possible because of the contribution in labor and go
of members of the community. The custom prevailing today

his croft to his eldest son. Some reformers feel that the youngest son or daughter who has stayed at home to care for his parents is cheated. When there is no will, the State steps in and assigns the croft to the widow, the eldest son, or the child who has remained behind.

7 The growth of the welfare state has had its influence in determining this pattern. On the one hand, there are payments to unmarried children who remain at home to look after their parents. On the other hand, there are the old age pensions. While the pension has made the transition of the old couple from active crofters and parents to grand-parents easier for the Irish small farmer,[13] on Skye the coming of the pension saw the end of the old pattern of the oldest son returning, with his wife, to care for his parents and raise his own family. With a pension the old couple had little need to work the croft. The children were not needed, and not infrequently the old people enjoyed their independence and their freedom from turning the house over to a woman whose ideas and beliefs conflicted with their own. The common desire of parents today is that one of their children will stay on to take over or return after they are gone. Naturally, no one likes to see his children far from home, but what can they do?

Aside from the difficulties of inheriting a croft or finding a vacant holding, it has become increasingly difficult for a young man to find a wife. Most of the crofters' daughters

the present harbour facilities are the result of this, with a causeway to Goat Island—a small snippet of land off the Newton shore—the King Edward Wharf extension to give a depth of 24 ft at low water, and the construction on Goat Island of a slipway and slipway jetty.

The present facilities are valued at several million pounds; they evoke, however, a blank stare of disbelief. Much of the industry for which the quays were first envisaged has now gone. The days of 300-400 fishing boats and the landing of several thousands of crans each week, with the attendant bustle and activity, belong to the past. The harbour remains reasonably active, with a considerable extent and variety of shipping: general traffic due to the Harris Tweed industry has continued to increase in recent years. The introduction of the ferry service direct from Skye to Tarbert, Harris, has however had perceptible effects.

When Leverhulme parted company with the people of Lewis, his gesture of farewell offered the island to its people. This brought into being an agency for the people of Stornoway and its rural areas, so that they were in effect in control of their own future to a degree unique in Britain. The Stornoway Trust was formed in 1924. Besides property in the burgh and its suburbs, including the Castle and its park or policies, the Trust owns virtually the whole of the landward area of the parish, from Arnish Moor northwards to the township of Tolsta. Freshwater fishings are in its hands, as are the resources of the sea and inshore fishings on the shorelands. During its first five years the Trust was faced with a growing deficit, though this was redressed partly through agricultural derating and partly through the registration of the Trust as a charity, thus exempting it from income-tax demands.

The Town Council, the Harbour Commission, and the Trust have overlapping representation, for harmonious work on behalf of the community. Indeed, by the conditions of the Deed of Trust drawn up by Leverhulme (in 1923-4), the Stornoway Trust must include the Provost of the burgh as its chairman, together with magistrates and councillors. Throughout the years of its existence, the Trust has sought to increase its usefulness, but at the beginning decisions were often taken piecemeal. Portions of the property were

763 relived and shared. The person's exact age and the
764 identity of his closest kin are discussed. A van is
574 immediately dispatched to bring benches from the church,
[493] which are set up throughout the house of the deceased,
and over the next few days a constant stream of visitors
[431] fills the benches. The visitors bring tea, sugar,
biscuits and other provisions for the days and nights
of communal trial. The tigh fhaire, "house of watching,"
as this wake is called, continues until the day of the
funeral.

764 In the past, persons sat up all night with the body.
[825] "It took so long to get a coffin. You didn't want to
[178] go in and find half the face eaten away by rats." This
custom is dying out, but lights are usually left on in
the room in which the coffin is placed. When an all-night
wake occurs, the atmosphere is one of relaxed story-tellin
and the sad laughter of reminiscence.

764 At least two nights of "waking" usually precede the
574 funeral. During this time, hundreds of villagers attend
[152] the tigh fhaire. Grief is expressed throughout the vast
network in which the dead person was enmeshed. On rare
occasions when a single night precedes burial, the house
is filled to overflowing.

Throughout the day and evening, waves of newcomers
enter, and other sitters slip quietly away. Kinswomen of

those who do not do their full share.

The year for the part-time crofter begins with the preparation of his fields. As a general rule both the man who spends his winter working for the British Railways or away at sea, and the one who finds summer employment near home is found on his croft during this period. Following the example of the large crofter some use a tractor while others continue to plough by horse. More and more are tending to take advantage of the contracting service of the Department of Agriculture and hire a tractor and driver. Once the crops are in, the majority are free until the lambing season. Conservative in his belief that too much handling of the sheep is harmful or individually faced with the almost prohibitive task of singling a small flock out of several hundred sheep, he tends to omit the March dipping. During the lambing season, the several crofters of the township either take turns on the hill or hire a shepherd. The first chore, then, which brings them together as a group is the marking of the lambs and the first dipping of the sheep without lambs. The July shearing and the statutory dips in August and November are cooperative ventures shared by all crofters no matter what size croft they occupy.

In sundry ways, economic interests, judged in terms of commercial efficiency, play a smaller part in determining the economic cycle of the part-time crofter than in the case of the full-time crofter. The part-time crofter does not think it worthwhile to ship his few head of stock to the mainland auction markets. He sells them locally at the tri-annual sales.

As far as I know only one attempt has ever been made by the smaller holders to sell their cattle at the large mainland markets since the last drove left Skye in 1906. There was a feeling at the close of the Second World War among the crofters that they were not receiving a fair price at the local sales. The Scottish Wholesale and Cooperative Society, which had become interested in the Highland Problem, offered to handle the marketing. Their cattle buyer, a man of wide experience, found the Skye cattle to be of high quality and suggested shipping them to the Stirling market. This is one of the largest in Scotland has the advantage of attracting a full range of buyers. Since the cattle were not at their best after the long sea voyage, they were provided with hay and pasture for a week after arrival. Unfortunately, a disease epidemic in the South forced a postponement of the market. Nevertheless, they arrived at the auction block in good condition. The prices obtained, an average of £1 or £2 more than they normally received at the local sales, convinced the crofters that there was no advantage in selling on the mainland. Actually, if the Society had not paid the expenses of shipment and feed, the crofters would have suffered a slight loss. Those who attend the Dingwall sales say they used the wrong market.

While the man who devotes all of his time to his pastoral-agricultural occupation finds it uneconomical to bother with gathering seaweed for manure, fishing, or cutting peat, the crofter of the category we are discussing often adheres more closely to the traditional cycle. After the

436 belief. Since agriculture is a poor risk in the best of years,
241 the present tendency to use more and more of the land for grass
233 and hay can be regarded as a more complete adjustment to the
439 environment. The partial involvement in the outside contractual world encouraged and made possible the change. The same reasoning applies to stock production, including the declining number of horses, cattle, and, especially, dairy cows. The exports, obviously, reflect market demands. A couple of
[262] crofters have unsuccessfully tried market gardening. The Sgiathanach is not a vegetable eater, and the commercial establishments, apparently, find a more dependable supply
436 elsewhere. A few crofters do sell potatoes in Portree, but
241 they will not compete with the large, east coast potato
432 farmer. In 1953, as soon as the price fell below the pre-season high, the crofters decided it was not worth the trouble
437 to dig the tubers for sale. The same held true for eggs.
436 Many crofters barter eggs with the food vans which serve the
235 rural areas for tea and meat. When the Scottish market was glutted in the summer of 1953, the crofters refused to trade at lower prices. They preferred to obtain their protein from the eggs, believing that the spring egg prices were the fair prices. For the sake of emphasis, I repeat, the involvement of the Sgiathanach in the world of commerce is only partial. Finally, in accounting for these changing economic trends, the aged and the absentee crofter must be taken into account.

887 The old people frequently cannot work their crofts or
241 cannot use them fully. The age at which the work becomes too

e pulled out of Lewis to go south to Harris,
e offered—such was the character of the man—as thanks for
the '98 per cent support' he got from the people of Lewis, to each
ch man his own croft as a free gift, and the Lewis Castle, ge-
gether with all his property in Stornoway, to the people of the
town.

In 1919, Leverhulme became proprietor of Harris, and con-
entrated his efforts in Obbe, now called Leverburgh, in South
Harris. The harbour at Obbe lacked the natural advantage which
Stornoway had, so he spent large sums on making it navigable.
Roads were constructed, piers built, numerous buoys and beacons
were set up to guide vessels into harbour; new quays were built;
and kippering sheds, and other buildings necessary for packing
and curing herring were erected. Among his other undertakings
in Harris were the provision of a mill for making tweeds, and he
built half the crest of the 34 miles of road between Leverburgh
and Finsbay. In 1925, after a visit to the Congo, he died in Bru-
ssels. His Harris scheme came to an abrupt end. And the remains
of a financial history are still to be seen in the quietness of the
little township named after one of the most stormy of business
petrels that Britain has ever seen.

Tourism

Tourism has always been a perfunctory and casual affair, until
the introduction of the fast ferries which now link the mainland
(via Skye) with the Outer Isles. Some 10,000 cars cross each year
from Skye to the Hebrides. In 1971, the Stornoway Tourist
Association had a struggle to increase the number of visitors to
the town, to establish it as a tourist resort. It is much the same
today with the Western Isles Tourist Association, which is having
difficulty in integrating tourist facilities with crofting activities. In
Lewis, the Stornoway Trust has assisted in establishing pony-
trekking, a venture which has the potential to mirror the success
of a similar one in the Isle of Skye.

PRESENT INDUSTRY

Almost an echo of the kelp-burning industry is the alginate in-
dustry. It provides employment for only small numbers, but is a

(c) SLOW CHANGE: 1945–59

1. The Land, the Sea, and the Loom

When Leverhulme parted company with the people of Lewis his gesture of farewell was one of generosity; the offer of Lewis to its people. The Stornoway Trust was formed, and this accepted the gift of the adjacent crofting townships of the Parish, and of the Castle and its beautiful Park or 'policies'. In crofting townships, however, the people declined the offered gift of land, finding that they could not afford the augmentation of rates entailed by ownership. So the remainder of the estate was offered for sale in several lots, which were bought by individuals and have proved safe investments. The letting of sporting rights adds a further, albeit a variable, return of income to that of the rents received. It is indeed anomalous that a crofting estate, such as a Lewis parish, can yield a good return to a purchaser, yet that the crofter-occupiers themselves would lose by receiving it as a gift.[1] Much-needed improvements in housing would also be discouraged, for fear of increase in their rates. It is true that if (under existing laws of assessment) all the farmers and crofters, cottars and squatters of a county were to become owners at the same time, there would be a great increase in assessments would either be repaid in greater services or met by lowered rates

[1] The reasons (as indicated in Chapter IX (d) are briefly that a crofter (or 'small landholder') as occupier of an agricultural holding, was only to assessed at three-eighths of the occupier's half of the assessment on his Fair Rent, or less than a quarter of the whole rental. Although he may have built a good house and other buildings he is not assessed at their full value; neither is his landlord. Were he to become owner he would then be liable to assessment both as occupier and as owner, on the full annual value of land and of buildings (so; with deduction of five-eighths on the agricultural value as occupier only.

A [see pp. 320–323—analysis]

—or by a compromise between. But as it is, if one crofter, or a small group of crofters like those of a township or parish of Lewis, were to become owner-occupiers (even by gift), they would be penalised as compared to others. Hence the Lewismen preferred to go on paying rent as statutory crofting tenants. Leverhulme sold the land and received the price; the new owners paid for it and received an investment; and the only 'loser' on this curious transaction was the Local Authority, the County, which failed to make more in rates!

Further reasons why the great majority of crofters declined Leverhulme's gift have been given by the Lewis Association's Economic Committee (1944):

(a) As individual proprietors, they would lose the advantages of the jurisdiction of the Scottish Land Court in dealing with their disputes, and any litigation would take a more costly form.

(b) They would be debarred from obtaining loans from the Department of Agriculture for Scotland for the improvement of their holdings or houses; as the Department would no longer have the " Corner Stone " of a landlord to fall back upon in the event of non-payment.

(c) The crofters were afraid that as individual proprietors they would forfeit their share of the Common Grazing rights.

(d) Should they wish to put their holdings they would be compelled to find a buyer in the open market, instead of remaining in their landlords and getting valuation.

(e) There is a feeling among Lewis crofters that they prefer to have a landlord before whom they can lay their difficulties and disputes, and who will attend to their wants; an authority that relieves them of responsibility.

As the historical evidence has shown, a lack of responsibility has been greatly due to the undermining and then the abolition of the authority of the township's own elected Constable.

The visitors each give the child a gift, especially a silver
coin. This coin of good luck is placed under the child's
pillow. The relationships, then, are essentially reciprocal
and individual.

The child's position within the extended family is also
fixed at the time of birth by his naming. As a rule, the first
son is named after his paternal grandfather, and the first
daughter, after her maternal grandmother. The second son is
given the name of his maternal grandfather, and the second
daughter, that of her paternal grandmother. There are ex-
ceptions to this pattern. One grandmother was adverse to having
her granddaughter named after her, because nowadays, with
late marriage, the naming frequently follows the death of the
individual. By far the most common exception occur when
someone in either parent's family of orientation has passed
away. Where the mother's father has died, the first boy is
named after him. The same is true for girls when the father's
mother has passed away. When a brother or sister of either
parent has died, especially without issue, the second born is
named "in honor of his memory." In these days of small
families, this has led to giving a girl the equivalent of a
man's name. There was, for example, Anguina who had been
named after her uncle who was killed in the war. Again, with
delayed marriage, the couple may have only one child. In or
she is given the names of both the paternal and maternal
grandparents, such as Ian (for father's father) Duncan (for
mother's father) or Morag (after mother's mother) Flora (after
father's mother). Aside from serving to identify members of

Thus the first place he had ever worked where his men did not
have to lock up their tools at lunch time, and the windows
were not broken as fast as they went into the frames. Still
there is some theft.

As might be expected in any area of low per capita
income and seasonal employment, some people succumb to temp-
tation. Clothes, new and used, first the temptation of a
candy bar, a shiny pocket knife and other such items which
newspapers may have on the counter too strong to resist. The
striking thing is that they always share their loot with
their schoolmates. Around New Years, when unemployment is
at its height and a man needs his bottle to see in the New
Year in the traditional way, some men turn to theft. It
never takes the form of house burglary or armed robbery. As
far as I know, the only case of armed robbery in which a
man from Skye was involved happened on a train in England.
His weapon was a rolling pin. The people at home were very
amused when he said he was taking the rolling pin to his
mother. The usual forms are to take a cow or sheep or to
loot a shop. No answer can be given to the question, how
much theft is there? The responses vary. "If you stood on
the corner and forgot who you were, they'd have you off in
five minutes, so they would," was one man's opinion. The
police say, "There's quite a bit of it." An old whisky
smuggler said

Cattle are kept on 120 of the 217 crofts. In all there are 1,200 cows of three years and over, 47 young cattle, and 1,200 ewes. The chief practice is to mainle the calves, and sell them as soon as they satisfy the ide' ard'ne. This practice is to enable the calves, and sell them as soon [274] The breeds of cattle are mainly Shorthorn and Shorthorn crossed. In one of the reasons for this practice. [275] Other function of the cow is to provide milk for the household, basically the Highland cattle. The [276] cattle are housed stalls. Cattle are sold at the twice-yearly market held at Garyvaul. No prices [277] are forthcoming generally. The terminalge of Park certainly is not the main market for cattle.

Sheep are more important than cattle in the crofting economy in Park. The breed is the [278] native Blackface, a small, lighter type of the Scottish Blackface breed. The sheep are pastured [279] on the common grazings in summer, and are grazed on the croft land in winter. The number of [280] sheep on the common grazings is subject to a rather strange system of cast ewes or ewes a defined breeding [281] age are sold every single year. The lambing percentage for 1956 was about [282] 65 per cent and the number surviving in August comprised 55 per cent of the ewes 12 per cent, [283] and 8 was generally agreed that 1956 was a poor year. A further indication of the poor quality [284] of the flock is that in the fishing township, a few hundred years ago, the average weight of a fleece was 2 lb 10 shillings. And a lesser [285] weight in the lamb crop. The lambs are sold at Garyvaul, and the ewes are sold in the late of good grazing and in good condition and lesses in a transhumance common [286] pasture raise the mortality rate. In general the sheep flock is not a very profitable enterprise [287] sufficient of shepherding although the more progressive crofters hold the ewes and hogs in [288] and weather.

The majority of the crofters in Park are Presbyterians, a minority in Garyvaul, real adi- [289] tional growing in Park Over Forest, paying a fixed sum for each year. There are three township [290] each better prices, in the other townships a few crofters and lower rate some are sold to the [291] Stornoway butchers. In many fields, were provides the only income from sheep.

It is evident from Table 2 that the income from sheep is greatly extended. In the calculations, ewes [292] are taken as one unit, and 'other sheep', wedders and gimmers are taken as half a unit each. [293] On this basis, the ar-ral sheep stocking is exceeded by 70 per cent and is only just over 1 unit per [294] crofter. The stocking is a-de-quating. Overstocking has been encouraged in crofting districts by [295] the ewe subsidy which is paid on a maximum of 10 ewes. The ewe subsidy is a factor in the [296] recorded in the Outer Isles township with 1956 which is notable that the rate is partly or entirely [297] Overstocking is without doubt the chief reason for the high stocking rate in Park. Calculation of [298] the overall relation of the actual and ideal sheep stocks in the whole Scottish Highlands and Islands [299] of Park are overstocked by 14 per cent. It is, however, impossible to calculate an exact figure [300] for the ideal stock in Park. The ideal stocking rate for the Highlands and Islands is based on [301] individual croft tenures and in Park Over Forest was not ascertained. It is also evident from the [302] stock equivalent to 197 cow units or 12 per cent of the total, who have no rights of grazing, have [303] contributing an average stock fairly close to the stocking, but the cattle-stocking ratio of 1:10 is too [304] low for proper management of the pastures.

In general, a low standard of husbandry obtains in Park, but it is clear that the agricultural [305] township are much more efficiently operated than the fishing township. Generally speaking return in [306] excess of the twice tenurgiie and sgo stock are, without exception, higher than the twice ennuie, [307] In Richland as a whole, the number of sheep recorded declined from 6,007,156 in 1938 to [308] 7,108,898 in 1956.

[Scots]

Drift is found near the shore and lapa round the three hills nearly up to the road, pro- [309] ximately twelve-thirty-eight with small tracts. Peat is replaced shows the by peaty loam on [310] rock. At one time, here was grown on the heavy drift. There is peat accumulation on the [311] flat land near the road and the drift of about four feet and there are now no rye peat beds. [312] Vegetation's peat; there is no bracken or cover and within the crofts, mentated grasses and [313] and weed cover. Cultivation is by the crofters, the land is divided into three to three [314] and weed cover. Cultivation is by the crofters, the land is divided into three to three [315] Eero's Pink Clinker Wonder on potatoes, turnips and carrots. The potato main crop is generally [316] for cattle, the turnips are used for sheep. Manure is applied to the land, 10 tons per Kraal Plan [317] for cattle, the turnips are used for sheep. Manure is applied to the land, 10 tons per Kraal Plan [318] has certainly not been grown since 1939, and probably not since 1929. The [319] [320] [321] [322] [323] [324] [325] [326] [327] [328] [329] [330] [331] [332] [333] [334] [335] [336] [337] [338] [339] [340] [341] [342] [343] [344] [345] [346] [347] [348] [349] [350] [351] [352] [353] [354] [355] [356] [357] [358]

Chapter 3

CHANGING ECONOMIC STRATEGIES:

LAND, SEA AND LOOM

In Lewis, the change from a relatively self-sufficient community in which land and sea provided the economic base occurred in the context of the phenomenal rise of the Harris Tweed industry. In the following pages, the history of Harris Tweed is discussed in relation to changing strategies involving exploitation of land, sea and loom. Associated features of social life are discussed. Social boundary systems are defined and discussed in Chapter 4.

A. The Sea

Around World War I, nine boats, as long as 27 to 30 feet, driven by sails, used to go out regularly from the Shawbost harbor. From five to seven men, usually neighbors, had "shares" in a boat. They would go out fishing during the night and return the next day. "We baited our lines with eel, for ling. We would catch maybe two or three hundred. I remember once we caught 1300."

195 On one of the crofts along the strand are the
228 ruins of two curing houses, where the fish were salted
(348) and dried. Ling, cod, skate and halibut were cured
(637) and sold to local merchants for export. "The same as
(171) they do in Iceland this very day. That was the main
195 industry. Then the English came with their steam
648 trawlers; they ruined the fishing here, and then went
229 west to Iceland and the Faroes. In Iceland they get
fined for poaching, but here the trawlers often ignore
● (433) the three-mile limit. But the fishing was the mainstay
here, before the Harris Tweed came along."

195 One man returned from sailing in 1932 and bought a
228 boat for L24. He had 12 lobster pots, and made 17 one
429 June by selling the lobsters at a shilling apiece.
501 Another man, who returned from the United States in 1934
(454) because of the depression, bought a share in a 14-foot
(491) boat. It was made in Ness, at the northern tip of Lewis,
(494) and cost about L14. He and his partners went out every
night possible; the fish provided an important part of
their income. The boat was sold in the 50's. "It wasn't
195 being kept up anyway." Around World War II there were as
228 many as twenty boats; men fished at night, after a day's
501 work. Today there are four 12-foot boats in Shawbost,
178 each shared by four or five men. The boats are used
521 intensively for fishing during certain times of the year,

283 developed from the concentration of power in the hands
170 of the merchants. In the early days of the industry,
441 all the processes involved in the production of a
297 finished length of tweed were carried out by individual
228 families. A man used wool from his own flock, and with the
433 aid of other family members, dyed it with vegetable dyes,
175 carded and spun it by hand, wove it, washed and shrunk
(346) it, and found his own buyer. Dyeing wool, spinning yarn,
286 and washing ("waulking") the finished length of tweed
228 was usually done by women. In Harris, the entire process
170 of producing a tweed was carried out by women, but in
462 Lewis the weaving was done largely by men.

A woman in her 80's recalls the process of weaving
175 when she was young. Hand-spinning had died out by this
286 time, although the question of whether tweeds woven with
such yarn could legitimately be called Harris Tweed was
not resolved until 1934.

"About 1916 or so it took about two weeks to a month
175 to do a tweed. You bought the wool from the Agricultural
283 Board. Sixteen bags of wool, costing about L20, would
(436) do four tweeds. You needed four one-stone bags per
● (433) tweed. Then you would spend a day gathering a bag of
(389) scraped from rocks and used for dye). One
(226) bag per one bag of wool was required for the dye. After
(283)

175 dyeing the wool it was spread out, dried and sent to
283 Stornoway to be made into yarn. The yarn was then sent
back, and the weaver wove and washed it. About six women
were required to do the waulking (the process by which
(642) the cloth was washed and shrunk).

"In those days the weavers designed their own
175 patterns, and sold their own finished tweeds. I remember
286 going into town with my brother, we had two tweeds in the
432 cart. We went into a shop to sell the tweed, and the man
said it was poor weaving. He didn't want to pay the full
price for it. I told my brother to roll it back up, we
would take it somewhere else. As we left the shop, he
told me I had 'good cheek.' In the next shop the merchant
didn't say anything, and gave my brother the regular
price. We went home with L60."

The great demand for tweed encouraged the development
286 of more efficient methods of production. One by one the
283 various processes of production were taken over by
170 specialists, and gradually these specialists were brought
● (433) together under one roof. Large boilers for dyeing wool
(434) were supplied as a result of actions taken by the Congested
(443) Districts Board, which was formed in 1897. The Scottish
(396) Home Industries provided chemical dyes. The most
(226) difficult and time-consuming processes were carding and
(283) spinning, which small mills on the mainland began to do

175 the 1934 decision to change the word "crofter" to
170 "islander") led to the weavers living in council
283 houses in town and working in loomsheds behind the
(341) houses. Unequal distribution has also contributed
to Shawbost's relative prosperity, and to the decline
of weaving in more remote parts of the island. The
(644) unequal distribution of tweeds has made it difficult
to maintain a large labor force, which in turn limits
the growth and development of the industry.

283 2. Instability of the Industry: The Harris Tweed
● 455 industry has undergone a number of crises. Periods of
170 depression have alternated with periods of prosperity.
(458) (See Appendix B for the fluctuation in the number of
yards stamped each year with the Harris Tweed trade-
mark.) The very conditions which give the tweed its
(455) market value—the decentralized, non-mechanized human
(444) element—also limit the possibilities of growth in the
industry, and contribute to the industry's instability.

288 When a business remains small, it must collect
441 orders before it can provide work to have the orders
filled (except when demand for an item is strong, as
occurred around the time of the previous world war;
during the war and for a few years after, tweeds could
be made first and then marketed, because any cloth
(471) could be sold). Only a large business can keep weavers

241 The Department of Agriculture dispenses subsidies to
654 all Scottish farmers, not just to crofters, and handles
about 210,000 claims per year. Lewis produces 0.46
● (433) of the agricultural output of Scotland, and 8.1% of the
agricultural output of the Scottish islands.

The major subsidies available to Scottish farmers,
654 including crofters, are for raising hill cattle, beef
235 calves, and hill and upland sheep. Sheep and cattle
subsidies were made available in 1941, in the early years
of the war, to increase their production. During wartime,
Britain was more dependent than formerly on her own
resources, and attempted to encourage production. Between
(458) the two world wars, agriculture had undergone a recession,
especially in the hills and uplands, because of a number
of events in world economics, such as competition from
New Zealand and Argentina in production of cattle. As
part of the scheme of the postwar Labor government,
agricultural support was made statutory.

For example, a man who keeps hill cattle may receive
L18.70 per cow as well as L5 for each acre cultivated to
feed his cattle during the winter. He receives L5 for
each cow which is tested for brucellosis. In the 1970-71
agricultural year, Shawbost received over L2,000 in sheep
and cattle subsidies, divided among 37 men receiving
subsidies for cattle and 36 men receiving subsidies for
sheep.

F. The Decline in Self-Sufficiency

175 Until the second world war, when weavers began to
433 earn larger sums of money for their weaving, the
● 175 township was relatively self-sufficient. The land was
433 more thoroughly cultivated, and the village boasted a
(240) number of local specialists. These specializations
175 were linked with particular family lines. Certain
463 592 families were blacksmiths; others were undertakers,
joiners, cobblers, or midwives. As generations succeeded
one another, occupations were not thrown open in the
competitive, individualistic way of the mobile city.
Certain occupations were seen to be "naturally" linked
with particular families. Sometimes it was said that
people of a particular family (which might include quite
a number of collateral lines) had hereditary characteristics which suited them for particular occupations.

"Taggy was an expert bone-setter. He wasn't a doctor
(159) at all, but he could set bones better than any doctor.
And he used to let blood, when people were dizzy with
threatening strokes, or had pneumonia. It was in the
people. He was a direct descendent, through his mother,
(829) of the Murrays of South Shawbost, the people who had the
mill and were the blacksmiths for generations. He got
that ability from them."

Appendix C

Balance Sheet of a Croft

*159 "The Mullean" has one croft and a two-acre buaile.
241 In 1970 he planted one-eighth of an acre with three bags
244 of potatoes, two of which he bought for £1s/16, and
*433 [435] harvested 22 hundredweights. This was sufficient for
his family's needs and provided some feed for his live-
stock for all but two months of the year. A small plot
is planted with cabbages, for domestic consumption.

Seven-eighths of an acre is planted with oats; one-
[311] and-a-half acres with grass and hay; and two acres
[296] are used for rough grazing.
[233]

The Mullean is interested in new ideas and techniques.
*159 He goes to meetings and discussion groups sponsored by the
232 North of Scotland College of Agriculture, and has bought
233 prize rams from the mainland to improve his flock. He
tries to raise a few sheep using techniques of good husbandry
rather than a large flock which would be given less
effective care. He is teased by other crofters for "over-
feeding," and for keeping his sheep on the croft and the
township reseeding rather than out on the moor. "His sheep
get homesick when they get out of sight of the croft." He
wins the prizes at the Carloway Cattle Show each year, in a

4 COMMUNICATIONS

000 FROM the earliest times, the provision of communications in one form or another has been a matter full of incident and high colour. Gaelic folk-song contains many references to
533 the hazards of crossing the impatient waters of the Minch. One
[481] such, a vaulking song still known today, commemorates the death of Iain Garbh Mac Gille Chaluim, of Raasay in Skye, who was drowned in Apr[illegible] 1617 on his way home from visiting the Earl of
Seaforth in Lewis; it is said that he was drowned through the workings of his own 'muime', or foster-mother, who employed several famous witches to raise the tempest in which his ship foundered.

12 For well over a century the subject of adequate communications has aroused continuous argument. The strength of any island community lies in its ability to live within itself, while accepting the periodic injection of certain external items necessary for living or for work. A Londoner once expressed amazement at the isolation of Scarp, in West Harris, commenting that in Scarp they would not know what was happening in London. The indisputable rejoinder was 'Nor do they know in London what we would be doing in Scarp.' However, to a large island community, with a certain degree of economic significance, communications are the basic lifeline.

SEA ROUTES

50 When in the early 1800s formal sea communications were being
*175 established between the island and ports on the west coast of
[481] Scotland, down as far as the Clyde, most of the islanders were of
[731] merchants little affected. Except for the professional classes (mer-
433 chants, ministers and the like), they had little use for the sea links
provided for them. Their economy was not yet a cash economy,
[433] and travel was thus a luxury they could not afford. In the nature
*175 of local life began to change with the infiltration of some of the
179
431

AGRICULTURE AND FISHING

429 With the disappearance of the middlemen, their sub-tenants be-
*175 came tenants of proprietors; and the descendants of these are
most of today's crofters. Mr Thomas Knox, who became Cham-
berlain of Lewis in 1833, was examined before a Select Com-
mittee of the Houses of Parliament on the question of emigration
from the island in 1841. At that time there were 1,913 small
tenants on the island who paid yearly rents varying from 63s 9d
[433] to 72s 3d. He stated that the country produced sufficient corn for
[731] the use of the people in most seasons. The years 1836-7 were
exceptional and outside relief became necessary. But he did not
167 consider that any person in Lewis was poor who had a lot of
424 land, however small it was demonstrably stocked. There were,
*175 however, in the island, small tenants occupying land unsuitable
for raising grain; and in order to avoid such distress as had
occurred in recent years he had advocated the emigration of
about 6,000 people, the vacant ground to be put under sheep.
This course had been followed in 1838, when five families num-
bering about seventy people were removed and the land they had
occupied was converted into sheep farms.

In the end, however, only a small fraction of the proposed
6,000 persons ever left Lewis under Knox's scheme. Those who
were left worked their land under a cloud of increasing distress,
in a system which had them in an iron grip. Eventually the bubble
burst, as indicated in Chapter 2. The prevailing social conditions,
and the events of historical progress, were manifested first in the
social action against the agricultural system and finally in the
legislation which gave the crofter certain rights.

CROFTING CHANGES

*175 In general, the island during the last century was able to support
204 its population, failing to do so only when disease struck at the
731 staple potato. Each family unit in the crofting township was self-
433 sufficient in most grown produce and the milk products from the
family cow. Very poor families grew potatoes only and depended
on neighbours for milk. But when the potato crops failed, distress
knocked at almost every door, the fishing communities on the
006 island tending to relieve hunger by looking to the sea. The removal

CROFTING CHANGES

The removal

of crofters from good to poorer ground was a significant factor in 241
the destitution years of the nineteenth century, with the self- *175
sufficiency factor becoming smaller and the dependence on im- 438
ports (when there was money to buy these) increasing. Today, 433
the crofter is of course not self-supporting, his economy being 434
based on fishing and weaving with the produce of the croft yield- 798
ing an annual average of some £200.

Acreages under certain crops show this trend to dependence on 241
the produce of mainland farmers. In the island in 1911 some 178
3,675 acres were under potatoes, the present acreage being 433
one-third of that. The number of people per acre of potatoes for 438
Scotland as a whole is 22:1. In the island it is about 15:1, indicat-
ing a heavy domestic consumption. Yet substantial imports of this 231
crop are required to satisfy demand; a relevant point is that the
milking cows commonly share the potatoes. The barley crop, once 274
much used in Lewis's former small distilleries, has been reduced
to some 10 per cent during the past fifty years. On the other hand,
the acreage of sheal crops, oats, rye and mixed corn, generally fed
to cattle, has about doubled. Oats in particular are in favour for
cattle fodder; even before the turn of the present century oats
were not widely used for human food, and oatmeal has for
centuries been imported into the region. The turnip acreage has 231
halved over the past fifty years, perhaps the result of the general
disappearance of the horse, its steady labour and its dung being
required to put good heart in to the land.

As the crofters' cropping policy has changed over the past half 231
century, so has their animal husbandry. Animals are a main sell- 178
ing product, particularly cows and sheep. Horses, of course, have 493
been drastically reduced from their total of 1,672 in 1911, as
tractor, lorry and van have taken over their work. And though
some cattle are raised, the numbers are now about 60 per cent
below those of 1911. At that time the density of cattle per 1,000
acres was heavy (46-60) in the north-east of Lewis, less (31-45) in
the north-west, and still less further south. The present average
is around 18 beasts per 1,000 acres. This decline, in particular, 202
in the milk-yielding animals, has compelled Lewis to import 438
1,000 gallons of milk a day from the mainland.

It is sheep which today claim pride of place on the croft, valued

AGRICULTURE AND FISHING

228 and its neighbourhood becoming the centre of the growing in-
*175 dustry. In 1793, the Lewis Parish contributors to the *Old Statisti-*
cal Account of Scotland indicated that upwards of 183 boats were
[463] fishing off the island. In Uig no less than 275 netmakers were
[286] recorded, showing that the fishing industry was prosecuted with
some measure of enthusiasm. 'All the people dwell in little farm-
villages and they fish in the summer season. The women do not
[462] fish; but almost at all times when there is occasion to go to sea,
they never decline that service, and row powerfully.' In the parish
[239] of Barvas in the eighteenth century some 9,000 Scotch pints of
oil were taken each year from dog-fish livers and sold to Stornoway
merchants at from 6d to 8d per pint; it is related that the
tenants of Ness were able for a long time to pay their rents with
the oil proceeds. Cod and ling were the principal fish caught by
433 the men of Lochs, an annual average of 24 tons being cured and
sold in Stornoway. Generally, other fish caught were consumed
locally.

Loch Roag on the west of Lewis proved to be about the best
fishing ground; in 1794 about '90 sail' from all parts of the United
Kingdom were at the herring fishing there. At one time Loch
228 Roag-cured herring was exported exclusively to Sweden. The
*175 minister of Stornoway, contributing to the *Old Statistical*
439 *Account*, gives figures showing the quantities of fish shipped from
the port from 1791 to 1796. During these six years some 14,000
barrels of herring were exported to the Continent, and 20,000
sent for consumption in Britain; some 350 tons of cod and ling
were destined for Continental markets. Herring, cod, and ling were
thus pursued during the following years with growing vigour,
though the inshore white fish took favour. The herring fishing did
not make great strides, mainly because to the middle of the nine-
teenth century catches were confined to the inland sea lochs; the
people for the most part were not familiar with deep-sea fishing,
and their boats and nets were not suitable for it.

228 Indeed, when Sir James Matheson bought Lewis in 1844, he
*175 gave scant attention to the potential in the fishings round his
[504] island. Though he expended considerable amounts in securing a
regular steamer communication between the island and
island, and spent over £2,000 in building a quay at Stornoway

FISHING

for the steamers, he thought that any improvements in connection 228
with the fishing industry should be paid for largely by the fish- *175
curers themselves—though he did spend about £1,000 on con- [504]
structing fish-curing houses. Why Sir James, with his experience
of business, should have taken this attitude is not clear; certainly
the fishing industry could have been given just the right impetus
with his interest, personal and financial. As it was, the industry
was left to develop on its own lines, with odd injections from
time to time.

Fluctuating prosperity

That the potential in the fishing grounds of the Minch was
enormous was realised before 1850 by fish-curers from the Scot-
tish mainland. But deep-sea-going boats were needed, and so
new models were created by James Methven of Leith, a pioneer
of deep-sea herring fishing, sank capital into the development of a [501]
large class of boats known as the 'Anstruther build', or in the [470]
islands as 'Eanstrach'. These craft served the islanders well, and
Lewis prospered, as did Stornoway. In the five years 1870 to 228
1875, for example, the average number of barrels of herring cured *175
at Stornoway for export was some 80,000. From 1875 to 1900 43
the average Stornoway district catch of white fish, much of it
caught by local boats and some of it cured at Carloway, was worth
over £100,000; it was sent to Ireland and the Clyde. After 1900,
fresh-trawled fish replaced the cured and the market fell away.
In 1921, the market value of cured fish from Stornoway was
about £500, ½ per cent of the 1900 value.

The herring fishing held its own, against the decline of the 228
white fish. Stornoway, as Lochboisdale in the Southern Isles, be- *175
came for a while one of the world's most important fishing ports.
Prosperity was in the air; even when the fishings did eventually
fall away there still remained, decades later, the whiff of past
success among the neglected curing sheds, the hangdown boats in
the quays, and the silent kippering houses. From 1917 to 1935,
the annual landings of herrings (in crans) varied from 25,486 (in [433]
1934) to 221,519 (in 1927). In that year, a record one, it was
reported that 'even landsmen could hear the roar of herrings in
Loch Erisort. So dense were the shoals that their progress in the

AGRICULTURE AND FISHING

228 water could be heard on shore.' Yet cash returns were poor:
*175 demand was falling off as foreign markets organised their own
fleets, and the Scottish fishing industry as a whole was not com-
*433 mercially efficient. In 1936 landings were 40,829 crans; in 1937,
31,969.

From about 1850, Stornoway had begun to see the nucleus of
what was to be a great fishing fleet in its harbours; but it had

[501] A 'Zulu', a type of old fishing wherry used in Lewis at the turn of this century

something of the sort much before then. A pamphlet on the fish-
ing industry published in 1790 tells us that the trade of the Storno-
way merchants began to grow after the Union of the Parliaments
in 1707, when Scottish herring were first admitted to the English
colonial market. 'Some twenty-five or thirty years ago, all the
fish they caught were carried for them to their port of destination
by hired vessels; but now they can show their own harbour, in the
fishing time, upwards of thirty sail of stout handsome vessels, from
20 to 70 tons burden, all their own property.'

[501] Towards the turn of the nineteenth century, the number of

228 452 175 off all their debts) much hard work was called for, as well as skill in locating herring shoals. The seasonal migration of herring is still a puzzle to marine biologists; it contributed to many a Lewis fisherman drawing a blank, to his ruin, while his neighbour came home flushed with success.

228 175 435 The financial values of the fishings of the island, particularly Lewis, are some index to its fluctuating prosperity. In a *Guide for Scotland*, intending visitors to Stornoway were told that the annual figures for herring exports were, in 1860, some £60,000; for cod and ling, £13,600; smoked haddocks were valued at £1,600; lobsters at £1,396. Herrings caught in Harris and Lewis in 1889 were valued at £57,071. Two years later, the figure was £90,738, but after that year it steadily declined to reach a little over £20,000 in 1894. Increasing again, the catch in 1898 was valued at £128,707. There was a subsequent decline, picking up a little at irregular intervals, which continued until the effective demise of the industry just before the second world war, that is so far as Lewis was concerned. These catches of valuable herrings were not made solely by Lewis boats; the catches of many stranger boats, from the east of Scotland, must also be taken into account, to leave about 20 per cent as direct return to the island.

In 1938, the total catches of herring amounted to £98,000 for fresh fish and £162,400 for cured herring. This catch was obtained by 111 steam-drifters, five of which were locally registered at Stornoway, and some motor-boats, of which one-third were strangers. Harris has never been particularly prominent in the herring-fishing industry; shell fishing has been more profitable. In the years just before 1900, the average annual value of shellfish caught in Harris was £2,306, only £500 below the Lewis figure. The Harris proportion of the aggregate herring and whitefish returns in the same period was just over £17,000, compared with the Lewis figure of £1,137,000.

Since the second war

228 175 433 435 Just before the second world war, Stornoway Fishery District furnished some 10 per cent of the Scottish cure of herrings, which averaged well over half a million barrels in 1937 and 1938, valued at about £1,500,000. Of demersal (sea-bottom) fish, the District

Lewis and Harris

6 TRADE AND INDUSTRY

IN the earliest times, the folk of the island of Harris and Lewis were self-supporting; all that they needed for life as it was lived in those days was available at near hand; their existence was self-contained, the economy virtually self-sufficient. By and large, the only commodities often imported were salt, iron, and, to a certain extent, wood. Rents were paid largely in kind: the produce of agriculture, fishing and labour. Surplus produce was directed to southern markets to bring in the odd shilling or two for which there was really very little need in the island. But once money became important in the national economy, it was not long before it was required in the island economy too. By 1790, if not well before, two or three open boats set out each year from Uig to Glasgow, laden with salt beef and dried salt fish. At about this time, too, changes were making their slow appearance in the island way of life and living. Specialists were being required: smiths, tinkers, shipwrights, netmakers, boatbuilders, weavers, tailors and millers. Each of these craftsmen generally held some cornland, either individually or in shares, and also had some rights in the common ground of the township in which he lived.

175* 511 (439) (427) (434) (436) 175* 178 511 463

CROFTER INDUSTRIES

From the pure crofter class there emerged the crofter-craftsmen. In Lochs, for instance, by the turn of the seventeenth century 80 per cent were registered as fishers and netmakers. In the west, in the parish of Barvas, some 70 per cent were also fishers, with kelp-making as a seasonal occupation. In Stornoway parish, where sub-tenants paid 30s to 60s in rent, with twelve days' service, they sold ling to their tacksmen at 5d each, earned 20s a month on herring boats, made kelp at 30s a ton, and worked on roads for 8d per day.

175* 463 (427) (434)

In Harris in 1895, the eight trained male weavers worked for the gentry only. Weaving for the populace was done by the

286 462 175 433

286 462 *175 • 433 273 *175 433 [427] [438] womenfolk, giving a ratio of only one male weaver to fifty-five families. In Lewis, male weavers were more common: one to every twenty-five families. The making of whisky was introduced about the seventeenth century. This was in addition to the old drink of home-brewed beer or ale *(lionn)*, and much of it was made to pay rents; it must have consumed a considerable quantity of valuable foodstuff. However, the spread of distillation as a legitimate home industry by which the rent could be paid, in kind or by sale, was followed by legislation prohibiting all but very large stills; illegal distilling of course went on in a small way.

*175 511 It was, then, by a very narrow margin that subsistence was won in the island some two centuries ago. Many times famine showed how close was the wolf to the island doors. The introduction of the potato, and the interest in the fishing industry led to an increase in the population, though as discussed in Chapter 3 this in turn brought more problems. Basically, the island economy had never been organised on a sound foundation, with the result that winds of change blew where they would with little or no control.

*175 824 323 388 433 A new factor in the island economy was introduced after 1750. This was kelp-making, the cutting and burning of seaweed on the shore for subsequent use in the manufacture of alkali for the glass and soap industries. The first tentative move in the island was made by MacLeod of Harris in 1748, when he allowed some Irish labourers to make kelp on his shores; so little was the product's value realised at the time that he only charged them 2s per ton manufactured. As the burning of kelp came to be understood, and the marketable value of the product ascertained, the native population set to. Between 1772 and 1864, about 50 tons were produced in Lewis each year, compared with some 800 tons per annum in the Uists; the Harris figure was 500-600 tons. The growth of the industry began to snowball, and the Minister of Lochs, writing in the *Old Statistical Account*, states that at the time (1796) some 50 tons were being produced in that parish [221] per annum. In Stornoway parish, though no figure is available, the minister reports that kelp-burning was the principal manufacture, and that everyone able to fill a creel, or carry one, was employed at it for about three months of the year. Little of it seems to have been done in Barvas parish. The price of kelp varied

according to the amount of barilla (its great competitor, a carbon- 175* ate of soda made from plant ashes) which found its way into the 824 British market. When the American war interfered with the im- 323 ports the kelp price was as high as £22 per ton. Prices began to 388 decline about 1810, and from 1822 successive reductions in duties 433 on salt and barilla resulted in the decline and demise of the kelp industry. As a consequence great distress appeared in those districts which had founded their whole economy on seaweed.

The weeds of most value to the industry, because they yielded [137] most salts, included *laminaria digitata*, *laminaria bulbosa*, *ascophyllum nodosum* and *fucus serratus*. One ton of kelp yielded an average of 8 lb of iodine, with certain quantities of chloride of sodium, chloride of potassium, and carbonate of soda. When subjected to special treatment and distillation, 2-3 cwts of sulphate of ammonia, and several gallons of naphtha, paraffin oil, and volatile oil were also derived.

The fishing industry, discussed in the previous chapter, took 175* over where the kelp-making industry left off and became another 228 king-pin in the island economy. By the end of the last century it seemed set fair for continuing prosperity. In 1900, harbours were [503] being planned and built with State aid in Uig, at Carloway, Ness [653] and Tarbert. Then 1914 came, and with it sweeping changes in international trade. Island fishermen were left workless with [511] wrecked and rotting fishing boats. In twenty years the number of Scotland's fishermen was halved; the remainder were all but ruined. The islanders' fate mirrored this pattern.

Yet another significant source of income for island families for 175* almost 200 years came from the men in military service, who 701 either sent money home or returned home with their gratuities 434 and pay. In the wars of the last century many enlisted in the Highland regiments, the Navy and the Merchant Marine. Even today, the income from this external activity is not insignificant.

EIGHTEENTH-CENTURY ECONOMY

175* Information and statistics about the economy of the island in the 113 middle of the eighteenth century are to be found in Walker's *Economical History of the Hebrides or Western Islands of Scot-*

178 and practical support, could win through to make marks on the island scene.

185 A significant event occurred in 1964: the establishment of 654 the Highlands & Islands Development Board. This was Britain's first regional development authority run by members who are • 433 either full- or part-time. The Board is grant-aided and has two broad functions: to improve the social and economic condition of the Highland people and assist in making the region more significant in a national context. The Board's attention in the Western Isles has been concentrated in the expansion of the [484] fishing industry and the development of tourism. In both these [505] fields there has been a considerable success: upwards of 100,000 visitors per annum visit the islands; and a fleet of over thirty boats, equipped with the latest gear, operate out of Stornoway.

433 Also in 1964 was produced the Development Plan for the 185 County of Ross & Cromarty. So far as Lewis was concerned, the Plan was based on an average decrease in population of some [167] 1,500 persons for every year in the future of the island. This, if carried to its logical conclusion, will see complete desertion in fifteen years or so! However, even if nothing further is done to halt emigration, particularly in the landward areas of the island, the population will remain around a stable 15,000. The County Development Plan contains much food for thought, but as with most county plans, does not indicate actual development projects. Rather, it lists all the resources of the island for the attention of those concerned. Potential developments include the setting up and exploitation of predominantly-fulltime crofts, shell-fishing, and inshore white fishing, herring and offshore white fishing, forestry, tourism and holiday accommodation, minerals, peat utilisation, hill-land improvement, marine reclamation and seaweed resources. This list is significant and merits the attention of the Highlands & Islands Development Board.

Harris, on the other hand, presents possibilities on a much smaller and limited scale. However, there are expansion potentials in tweed, knitwear, and craft industries, with tourism promising to be a good base for the island's economy. As the age-structure of the crofting population changes, there will be a useful re-organisation and enlargement of existing holdings to make for

better economic units. There could well be plants for fish meal 433 • and canning, working in conjunction with fish-farming ventures. 185

Perhaps one of the most significant events which have occurred was the formation in 1972 of the Lewis Development Fund Limited. The Company has the following aims:

1. To strengthen and expand the economy of Lewis and in consequence that of the Western Isles by promoting and encouraging the development of all the natural, economic and industrial resources of Lewis and the Western Isles.
2. To encourage the repopulation of the Western Isles and to encourage industries in the island to obtain the necessary staff and labour.
3. To encourage the building of shops, factories, public works, churches, places of amusement and any other works which the company might think fit.
4. To encourage tourism.
5. To promote and carry on businesses such as building, fishing, buying and selling, agriculture and manufacturing, etc.

The Company has given itself wide powers to lend and borrow money. A target of £150,000 is envisaged, which funds will then be used to help all kinds of economic and socio-economic ventures.

Surveys carried out in the Minch area in 1971 by British 315 Petroleum and the Gas Council have indicated the possibility of oil. While there are no signs of the traditional anticlines—the dome-shaped geological structures—which normally signify the presence of commercial quantities of oil or gas, there are hopes for secondary sources in the more complicated rock-structures which could be oil-bearing. The sea-bed of the Minch is young rock of the type which bears oil in other parts of the world.

The assumption, in 1974, by the Western Isles Regional 185 Authority of most of the functions of the mainland local authori- 433 ties is thought by many to be a chance to sink or swim. Having been for so many decades under the thumb of external influences, the islands now are being given the opportunity to devise relevant methods for ensuring their socio-economic viability in the future.

All in all, the island is going through a period of re-stocking,

185 to recover from the inhibiting influences of centuries-old history, • 433 economic isolation, and the ravages of two world wars. The emergent community, though smaller, will be as rich in quality and personal ideals as it has ever been. To say that of an island, of any island, indicates that its community is more than worthy of support in its endeavours to remain true to itself and its long-standing heritage of island life and living.

121 cannot be changed, as for the future which can—lies in the intensity of its communal traditions, extinguished elsewhere. Much has gone—many of the fishing crews are [178] disbanded and team-work has weakened—but much lives on, and much has been learned. The Gaels have still to [184] make their full offering to English-speaking civilisation. To do so, they must find their own fulfilment within the framework of the Highlands of Scotland.[1]

2. *Scottish Crofts, Farms and Labour-teams: the Rural Unit Today*

184 When, in thinking of Scots countrymen, we differentiate 105 between the men of the Highlands and Isles, the Lowlands and the Borders, what stamp of occupation, society and economic class best characterises the three regional types? The differences we note between them are due not only to their place of birth and region, but to their occupational [433] discipline and social ways. Imagine, for example, a Gael, a Lowlander and a Borderer, all three of whom follow the same calling—say, a trio of farmers, of shepherds or farm servants, or of independent, full-time small-holders. When brought together each trio would find they shared similar interests and aims in their work, and all that follows from it. In fact, they might have more in common than three Gaelic-speaking men who differed from one another in vocation, although, as Gaels, the latter group would find a bond in culture and kinship. But a fourth type of Scot, the crofter of the North-west townships with whom this book is concerned, would stand out, distinctively, from any other, whether his home were Zetland or the Hebrides. Thus not only their home or region differentiates Scots countrymen, but their calling or class; and their families [113]

[1] A. Geddes and F. D. N. Spaven, *The Highlands and Isles* (1949).

511 coat, was thought to be supernatural. The fishing, too, is 226 of good standard: a typical annual catch including 1700 511 salmon, 5000 sea-trout and 1800 brown trout; and it was for this, as well as for the shootings, that the moors pertaining to the different shooting or fishing lodges and hotels 137 were bought at Lord Leverhulme's sale. The absence of 233 foxes was important to sheep-rearing before the introduction of guns, and is still a favourable factor.

5. *Sea-fishing*

226 Fish have always contributed to the diet of the Islesfolk, 178 whether they fished from coracles or boats, or with 'lang wands' from the shore as they still do, and as they did in [262] the days of Dean Monro and, no doubt, right back to [433] neolithic times. The relative importance of fishing and [241] agriculture, however, has always varied according to place and time.

182 Fishing in modern and historic, and also in prehistoric, 226 times—to judge from the kitchen middens of Uig—has 241 always flourished more where there were deep sea-lochs; and settlement resulted, even though rocky hillsides made [178] ploughing difficult or impossible. Conversely, agriculture [172] has offered better opportunity on smooth coasts with a variety of soils, though fishing was poorer there. Thus the men of Stornoway Bay and Eye, of eastern lochs and of the Harris bays, like those of Loch Roag on the west, have long been partly fishermen. In the extreme north, too, men of Ness—with the chance of choosing their fishing grounds on the north, west or east of the island and with their little rocky port giving shelter, of a sort, from south-[461] west gales—were good fishermen; they are good seamen [829] still. "The fishing of the Barvas folk" is an old gibe,

221 and clothing, firing and shelter produced met local needs. 175 Further questions of early economy belong to Part Two, as do those of the festivals by which the seasons were initiated and closed, along with the phases of human life.

221 A century later (as indicated in the lower graph), agri-[178] cultural tasks were much the same, but the character of [433] fishing had altered greatly. Herring fishing was at its height in the Island for some fifteen years, or half a generation, before 1914; but it never recovered from the difficulties of the war and after-war periods. The curves of the summer, autumn and winter fishing indicate the 'full-time' activity of summer, and the 'part-time' work of [462] early winter. Not only the men, but the women participated, the women being employed in gutting and kippering. Boats and men fished further afield. Women were employed in gutting in early summer in the Scots East Coast fishing, which preceded that of the West Coast and was followed by the East Anglian autumn fishing. Some line-fishing continued locally in summer, but it has now almost ceased. The building and repair of roads increased after the middle of the century. The carting of peats, stacked by the roadsides, lessened 'creeling'; but it is particularly haulage by lorry which has replaced carrying by the creel, so lightening women's labour.

[178] Indoors, primitive crafts tended to be superseded as [571] machine-made articles replaced those of native material and manufacture; but the *ceilidh* ('*cailey*'), the meeting 'together', continued, though the arts of song and poetic 462 improvisation declined. In Harris the women had woven 283 and spun for centuries and have continued to do so for home 286 use and sale; in Lewis the women gave up weaving in the last 178 century, few spinning since then and none weaving. Thirty years ago only an occasional weaver, always a man, could be

174 of the Norsemen, lay a succession of earlier periods. A 613 phase of primitive settlements is traceable in archaeo-172 logical remains and in recent and contemporary survivals. 191 It is shown in the physical race-traits distinguishing those in one part of the Island from those in another. Fragments of tradition telling of the first Christian missionaries survived the Norse invasions and settlements, dated from A.D. 800 or before, down to Haco's defeat on the Clyde at Largs in 1256. These fragments can be linked to chronicles and to later tradition, on which they throw fresh light.

[144] A survey of the archaeology has been published,[1] but comparatively little, as yet, on race. Yet different communities are distinguished by marked racial types or strains. Although many, indeed most, of the race-strains of the Island must have entered it in prehistoric times, some are linked to tradition, and history accounts for the more [141] recent immigrants. The striking element of race in the Outer Hebrides is a broad-headed type prevailing from Barra to the Lews, accompanied by medium stature and dark hair; it is also found across the Northern Minch. But within the Island are notable differences.

829 Variety of race being accentuated by difference in ways, the communities still comment pointedly upon one [538] another! For instance, an old saying is not forgotten: "The folk of Cladach, but the gentlemen of Uig!" (*Muinntir a' Chladaich, ach daoin' uasaile Uig*), [433] 'Cladach' being the western 'Beach' district possessing [632] ploughland but poor fishing, which covers the modern [133] parish of Barvas (excluding the north-west cliff-promontory [113]

TRADE AND INDUSTRY

288 Thus were laid the lines of a new form of economic organisa-
75 tion for Lewis. At first, tweed manufacture here, as in Harris, was
62] strictly a domestic activity: the wool of the crofter's own sheep was clipped, washed and dyed, carded, spun at home, and woven into cloth by persons in the township with the skill to produce a suitable cloth; the weaving was a part-time and mainly female occupation. Payment for the weaving was in kind: peats, potatoes, or labour. The waulking or finishing of the cloth was mostly a communal activity carried out by the womenfolk, who turned it into a particular social occasion with definite feminine characteristics. If the cloth made was in excess of domestic requirements, the crofter sold it directly to a customer, or else the local shopkeeper bought it or gave credit for it.

288 With the rise in weaving for a definite market in Lewis, all this
463 changed. Weaving became a full-time specialist occupation and,
75 partly because the flying shuttle made the work heavier, it be-
462 came predominantly male work. With the use of mill-spun yarn
288 there grew up a number of merchants, the Lewis 'producers', who
75 bought yarn either locally or from the mainland, and put it out
441] for weaving and hand finishing on a commission basis. The yarn and the resulting cloth remained their property. At times the cloth embodied a handspun weft; at other times perhaps no handspun was used at all. As pointed out above, it was marketed as Harris Tweed, as was the 100 per cent handspun cloth, yet it cost about 21d to produce compared with 36d for the 'real' tweed. The cheaper type provided Lewis's rapidly-expanding output between 1900 and 1911, and by that year Lewis had outstripped Harris. In 1912, the handspun yardage produced in
433] Harris was 175,000; partially and wholly millspun accounted for some 4,000 yards; and the total value was £26,500. In Lewis the yardage of handspun cloth was some 10,000; but about 340,000
435] yards of partially or wholly millspun was sold. The total Lewis value was £44,000.

The trade mark

288 When eventually the question arose of some mark to distinguish
441 between the two cloths, it was with difficulty that the Harris mer-
75 chants persuaded the Board of Trade that a distinction was neces-

Lewis and Harris

A HARRIS VIGNETTE

HARRIS'S OFFSHORE ISLANDS

Scarp

361 Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile across at its narrowest, coursed by strong [133] tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides; the maximum altitude is nearly 1,000 ft. On the east side lies a 361 tiny marginal belt of good land, machar and soil; on this green 311 shelf, about one-third of a mile long, were all the crofts of the [134] Scarp settlement. Many stand deserted, and abandoned lazy-beds [241] in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the minute amount of land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

*175 Scarp was originally settled about 1810 and was occupied by 361 eight farming families who were reasonably comfortable. Not only did they have the island to themselves, but they had access to good pasturage on the Harris mainland opposite. About 1823 [166] thirteen small townships between the head of Loch Resort, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate their families and friends from elsewhere. In 1861 the population [162] was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

433 The local economy was essentially a subsistence one, with self-241 sufficiency in such products as potatoes, turnips, cabbages, oats, 234 milk and fish. After a break of some years lobster-fishing has 226 recently been reinstated as an occupation. Oil lamps are the only 354 lighting, though a few houses have piped water. The small shop
336 176
000

829 of Ness), while Uig is the most westerly promontory with
433 its natural fishing harbours. The authorship of the pro-
632 verb may be ascribed to the ladies and gentlemen of Uig;
133 yet the personal appearance of the victims, who are more broad-headed, gives the proverb a physical foundation.
174 Again, the tall men of Ness, dark or fair, and rather longer-
172 headed, still form a group apart from those of Cladach, each having taken root in prehistory, *i.e.* earlier than
141 surviving record.

144 Such facts correct several current misconceptions as to race and heredity in their relation to Gaelic society, past and possible. First, it is still common to contrast a 'Celtic' with a 'Norse race'. Now, Norse immigrants belonged to several races, and when they arrived, several race-streams were already mixing and eddying in the Isles. After the immigration of Norsemen, the next recorded was in 1611, consisting of gentlemen-tacksmen from Kintail and burghal settlers to Stornoway, who were composed of Gaelic-speaking families from Easter Ross, where the people of today resemble some Scandinavian types rather than typical broad-headed Lewismen.

Second, it follows that no sweeping generalisations can yet be made as to the ways and habits of particular races. The "Celtic race", one reads, have "never taken to the sea" as have the Norsemen.[1] The facts in the Island are that though the men of Ness, with a possible Norse admixture, were considered better fishermen than those of Cladach, and the present generation includes a great number of seamen, their opportunities have been greater —their cape commanding wider fishing grounds and their little port providing relative safety in storm. And the men of Lochs and of the 'Bays' of Harris, though they show

[1] For example, in the Brand Report on Lewis (1902).

121 by help of oral tradition and of the living witness of con-
174 tinuing usage, we can reconstitute Gaelic life from the
178 view-points of both people and chief. Elsewhere, even in Scotland, only fragments of early life are recorded, in
175 parchments written by the lawyers of landlord and king,
814 and almost always from the privileged side. History is
127 indebted to modern lawyers who have deciphered and published the faded documents of their predecessors. But the very training as solicitor-factors which fitted them for this specialised task, in no way prepared them to view life as seen, experienced and felt by the men and women of the past, or even by the elders or youth of the townships today, with whom they have rarely laboured and whose mother tongue they rarely understand.

(A) THE LABOURS OF MAN AND WIFE, AND THE REWARD

621 We have seen that until the nineteenth century the
632 township in the main was self-contained. Its people grew,
175 reared or caught their food, and also found the raw materials
433 for their clothing; they built their own shelter, and cut
174 their own firing. As a result, both men and women had each to develop "a wide range of simple skills", in the
175 apt phrase of a Lewisman, Mr. Donald MacLean, M.A.
462 Beyond the co-operative effort within a family, a farm group, or a body of 'fellow-townsmen'—in which each was competent to take a share according to sex and age—aptitude and family tradition initiated some local division
463 of labour. The resident smith and the 'caird' (usually a wandering craftsman or tinker) appear in the oldest tales and in the first rent-rolls. In addition there were honorary
759 tasks. The smith might act as the village surgeon, ready

175 usually corresponded to six imperial bushels). The stock
434 was "four milch cows, three to perhaps four horses, and as many sheep on the common as the tenant has luck to rear". Although such estimates, especially of crop yields, are apt to err on the favourable side, a comparison with the same writer's statistics of stock (and rental) shows that this estimate gives only a little over the modern average per family in Harris, and allows an average sheep flock of one score ewes.

175 The briefer Statistical Accounts of Lewis indicate the
434 average stock per family, suggesting comparisons both with the present, and with an earlier time (Chapter II). In 1790
422 the cattle and horses, though small, were greater in number per family than now. In Lewis there were eight head of cattle per rural family, compared to 2·5 today; there were one or two ponies per family (according to the topography and ploughland of the parish) instead of an average of only one horse to five or six families today; the small family sheep-stock was similar; and there were also some goats,
175 say, one to every second family. In addition to these
226 resources, there was fishing; and the number of boats in Stornoway parish, giving one boat to four families, is a guide for the rest. Fishing, with net-making, was a predominant occupation in all parishes by that time, and boat-building was significant too.

175 As to changes, fishing had grown in importance since
433 about 1720, and kelp-making added an important new
434 resource. But one may doubt if the Island supported an appreciably larger live-stock in 1790 than seventy years before; one must rather assume smaller shares per family,
182 for population had increased. A basis for agricultural security was an adequate balance of sandy machar to 'black', peaty, clay land; and the area of machar, a limited

175 natural zone, could not be extended. In any case, the re-
433 clamation of clay land tended to slacken as efforts turned
431 to fishing and kelp-making. The introduction or increased
[182] growing of potatoes added to the human, but hardly to the
[311] animal, food supply. Finally, while the beginnings of
[232] medical knowledge and vaccination had aided the growth
[422] of population after 1750, veterinary science had made no progress, nor did it advance in the Island for many years to come. We may conclude that an average stock per Island family about 1720 was rather more than that of 1790, and the acreage relatively larger, while both were greater than the average of today, particularly in the Lews.

175 What, then, could a family have to eat, from such crops
262 and stock? While in winter even now there is almost no
244 milk to be had on a croft, and there would be little then, there was salt meat, dried or salted cod (or herring) and fish oil; oat and barley meal and some rye meal; cabbages; and, increasingly in the eighteenth century, potatoes. Martin included potatoes among the crops grown even on far St. Kilda in 1697. A century later it was written that the people of Uig, for instance, had, though 'unwilling', been induced to grow and eat them 'forty years before'; and the years tend to be under-estimated where changes are slow and memories long! But it was written of Harris that by June the meal and potatoes had mostly been consumed, "and such as cannot afford to purchase imported meal subsist chiefly on the milk of their cows and sheep, with what fish they may chance to catch, till their wants are relieved by the first fruits of their potato crops early in Harvest".

175 We conclude that with even less money but a little
511 more grain the population in the Island had fluctuated
162 about a mean for some centuries before, as it had in so
171

175 rent-rolls record something of more vital and enduring
241 concern, the unit of community life in the Lews. This was
427 the 'conjoint' or 'group' farm of the labouring peasantry
[476] —though it was overlaid in parts of the Island by the formation of tacks held by gentleman rent-farmers.

175 Both rolls are Judicial Rentals, that is to say, the
241 tenants, great and small, were convened by the Govern-
427 ment Commissioners and examined on oath as to the rents
656 they formerly paid; the accounts were then entered and totalled. Because of the Jacobite resistance, the small amounts of rent and the maladministration of the Forfeited Estates, doubt was cast upon the first rental, of 1718. A second rental was therefore compiled in 1726, upon a different system, which confirms the correctness of the first.[1] All were named, including those absent or 'valetudinary'.

175 Owing to the Island's comparatively smooth land sur-
361 face and access to the sea, the people could group themselves
[182] as they chose. Whereas in the Highland mainland many
[184] a pocket of land is too small to keep more than two or three
[433] families alive and no fishing grounds are available, in Lewis
[476] the people could join together in teams of four, five or six, to work a hamlet-farm or penny-land, definable as a joint-farm of unit size, and to man a boat with "four to row and one to steer".

175 The first point of interest is the equality of the shares,
241 each man paying exactly the same as his fellow-tenants for
427 his 'farthing',—a fourth, or other equal share of the farm.
[436] An average share of rent was a little over 10 shillings sterling
[113] with additional payments in farm produce, though not (as

[1] A. Geddes, "Conjoint Tenants", etc., *Econ. Hist. Rev.*, Second Series, vol. I, no. 1, 1948, pp. 54-60. This reconciles the evidence of 1718, reproduced in the Brand Report (1902), Appx. O, and that of 1726, edited by J. R. N. Macphail (1916).

233 reach their shielings. From Point district (Eye Peninsula)
423 the cattle are still brought inland to the moors south-west
[632] of Stornoway. And from Bernera on the west the cattle are swum to the hills of the main island, just as they once were swum from Bute to the hill-pastures of Cowal in Argyllshire across the Kyle at the 'Strait of the Swimming', Colintraive (Caol-an-t-snaimh). Nothing could be more natural, indeed inevitable, than pasture in common where large, open moors were to be found. The number of animals allowed to each holding was duly apportioned and then, as now, was known as the summing or 'souming', still checked at the annual gathering (*cosgoradh*).

423 Thus a cluster of conjoint farms shared "the grass on
621 the Ben and the tillage on the machar" (*Fiar air beinn agus*
433 *peighinn air machair*). Along the shore, sea-ware, drift-
[175] wood and the like were allotted, too. And, as Carmichael put it, there was even "run-rig at sea", for the fishing
[178] banks were allotted among the available crews. Most of these rights are still shared by the members of a township. But any crew can now fish freely where they choose, and no township can legally keep away strange boats, nor even steamers beyond the three-mile limit. This loss of communal rights stands in the way of remunerative fish-farming and its promise.

621 Profound social implications distinguished these three
423 concentric circles of community: the family; the farm-team
[593] and boat's crew; and the larger, township group. These
[241] implications concerned labour, duty and right. The labour
[476] of reclamation gave a 'right' to the land thus won from the
[632] moor; and the duty of labour together, for fruits equally shared, gave the farm-team and fishing crew cohesion on land or sea—team and crew working for a common purpose. On the other hand, as individual sharers in the common

CHAPTER IX

ECONOMIC CHANGES: 1750-1919

(A) TRANSITION: MIGRATION, FISHING AND KELP-MAKING

175 UNTIL the 'Forty-five the township had lived an
433 almost self-contained life. Its traditional economy
[621] was self-sufficient except for two indispensable commodities—salt for the housewife and iron for the smith.
[427] Beyond this, the chief demand for payment was the rent
[794] to the lord, with tithes for the kirk. For these needs and
[430] demands a step towards production for exchange was required, the more so that what was exported might include the very necessities of life in 'bad years'. The rent was paid largely by the sale of a surplus steer or two, and

175 drovers called for the cattle. By 1790, if not before, two
317 or three open boats set out annually from Uig, for instance,
436 for Glasgow, laden with salt beef and dried salt fish.
[435] Although salt seems of little account today, it once bulked large in the Budget, its price being heightened by duty, especially after 1707: "as dear as salt", was a saying, *cho*
[251] *daor ris an t-salluinn*. Salt was needed to preserve the carcase of a 'cattle-beast' or sheep killed in autumn, and

175 for cod and herring curing. Wrecks were valuable, as on
433 all infertile undeveloped coastlands, both for their timber
[326] and their iron. Cairds or tinkers occasionally brought metal goods; or a packman called, as strange a figure then
[443]

as some Indian pedlar one meets on the road may seem now. An older packman's tale of his long tramps, of the people's poverty and hospitality, must have resembled the mingled plaints and praise one hears from an Indian pedlar today! But in the past only a speaker of Gaelic could find his way among the people. Almost until 1900, if not still later, Gaelic speech was to prove a social bond, but ignorance of English speech an economic barrier.

The transition to increased exchange, with migration, permanent and temporary, tended to make for specialisation. About 1795, *Statistical Accounts* enumerated, for every hundred families, two or three smiths, wrights (or carpenters), a shipwright or some boat-makers, a few weavers, tailors, and perhaps a miller. Each of these held some corn land, individually or in shares, with rights on the common. The line between plain crofters (to use a later term) and crofter-craftsmen was not easily drawn, and different writers wrote as they judged best. In Lochs, 80 per cent were fishers and net-makers. On the open shores of the west, in Barvas parish (in which three-fourths of the men were also 'fishers'), kelp-making was a seasonal occupation. In Stornoway parish, where sub-tenants paid 30s. to 60s. in rent, with twelve days' service, they sold ling to their tacksmen at 5d. each, earned £1 a month on herring boats, made kelp at 30s. per ton, and roads at 8d. a day.

In Harris in 1795 the eight 'bred' (or trained male) weavers worked only for 'the gentry': the laird, the tacksmen and their families. The rest of the weaving was done by the women, giving a ratio of only one male weaver to fifty-five families. But in Lewis male weavers were commoner—one to every twenty to thirty families was the ratio—as if the practice of home weaving by the women was less universal there, even at that date.

About the seventeenth century there was introduced the making of *aqua vitae*, *uisge-beatha* or 'whisky', an addition to the ancient drink of home-brewed beer or ale (*lionn*), a pleasant brew still tolerated by the Excise. In order to pay the rent, the making of whisky from home-grown barley must have consumed a precious foodstuff. The small bulk of whisky facilitated export by tacksman or Factor, and it also served to tickle the palate, cure the ills and cheer the spirits of the crofters themselves. But before 1800 'the Gauger' was in the land, though there were undoubtedly whisky stills that escaped his eye. In some of the old houses a hollow space was left at a selected spot between the inner and the outer walls, to conceal what was not meant to be seen. A pleasant picture survives of the eighteenth century. It is told of a man of exceptional prosperity, that when he laid his head on a pillow "he could hear on the one side the clacking of his corn mill and on the other the babble of his still". What more could the good man want? Nevertheless, the increase of distillation as a legitimate home industry by which to pay the rent (in kind or by sale), followed by legislation prohibiting all but large stills, first encouraged the Islanders in a taste for strong drink, then tempted them to smuggling and breaking the law.[1] Seaforth started two distilleries at Stornoway, importing barley for the purpose. By 1825 these had ousted the illicit stills, but they were closed about 1870.[2]

From a perilously narrow margin of subsistence, periodically overstepped in famines, the Islanders passed to a larger measure of production for sale, and in the second half of the eighteenth century population increased. Its

[1] Cf. D. Stewart of Garth, *Sketches of the Highlanders*, 1821, vol. i, pt. ii, sec. v.

[2] Brand Report, 1902.

175 growth followed the increases in potato-growing and fish-
178 ing, in income and food production, and the introduction
434 of vaccination against smallpox, which had formerly taken
a heavy toll of child life.[1] This increase found an outlet
(433) in emigration to the Colonies, often led by departing tacks-
(751) men though discouraged at first by the Island lairds. For
example, in July 1773, 840 people sailed from Lewis.
175 "Alarmed by this, their master . . . came down from
434 London to treat with the remainder of his tenants. What
are the terms asked, think you? 'The land at the old
167 rents, the augmentation paid for three years back to be
refunded, and his Factor to be immediately dismissed!'"
(214) Although the *Edinburgh Evening Courant*, from which this
quotation is taken, went on to say that it was expected that
the demands would be acceded to, or the Island would
become a desert, the Factor was retained.

175 The pressure of population can be imagined when the
167 appalling conditions of transport overseas are remembered.
505 A case is known of 700 Gaelic emigrants setting out from
the Clyde across the Atlantic in a vessel for which the
maximum human cargo of negro slaves permissible was
400. The regulations governing the transport of slaves
did not apply to the transport of 'freemen'. In quoting
this case, D. F. Macdonald suggests that while it was in
the interest of slave-owners that their slaves should arrive
in the Plantations alive, it was rather in the interest of
manufacturers to discourage emigration so as to keep a
supply of labour at home with which to meet their growing
demands and fill the gaps due to a high mortality, par-
ticularly among workers newly arrived from the country.[2]
It would also seem as if it had not been in the interests of
landlords to improve passenger regulations at that time,

[1] Brand Report, 1902, p. xiv.

(113) [2] *Scotland's Shifting Population, 1750–1850* (1941).

000 landlords to improve passenger regulations at that time.

175 Wars brought enlistment in the Highland regiments,
162 the Navy and Merchant Marine. Owing to migrations of
all kinds, males came to be outnumbered by females, then
(702) as later (100 males to 114 females, 1931).[1] In Lewis in
(167) 1795 the proportion was 100 to 111, and in Harris 100 to
124. From this period onwards the 'export of men' con-
175 tinued, modified by the reserve for war. Men were trained
162 for the Naval Reserve and Militia; and in 1900 for instance
800 men were training at Fort George and 2500 sailor
702 were in the Reserve. The maintenance of a reserve for th
Navy was one of the strongest pleas for the framing of th
Crofters Act.

175 A new resource, important to the Islanders after 175
824 was kelp-making, the cutting and burning of seaweed upo
the shore, for use in the manufacture of alkali in the gla
323 and soap industries. From 1770 onwards the price ros
388 heightened first by an import duty, then by the Napoleon
Wars. Estimating from the high prices, averaging ov
175 £10 per ton from 1800 to 1823, Sir John Sinclair put t
824 value of the annual produce (20,000 tons) at £200,000. "
435 may appear surprising", he remarks, "how that sum co
be of such importance to 80,000 people"; but he g
on to point out that this gave the additional cash nee
to supplement their subsistence. But even when Sinc
wrote in 1825, the industry was in peril. Failure and
occurred almost immediately after, with disastrous effe

175 It is complained in the *New Statistical Account*

Lewis and Harris

175 178 and savings were sent by emigrants who remained faithful
• 433 to parents and home.

167 If it be asked why most of the people kept to their Island home in spite of its poverty and earned so little
175 away from it, one answer must be that their native tongue formed a barrier encircling them as a community at home
178 and cutting them off from the rest of the nation. Seventy-
197 five years ago the new Education Acts were not yet in full operation. Comparing the relative well-being in the
(671) Shetlands with the extreme poverty in the Hebrides at that
(871) time, a northern agriculturist wrote that in Scotland, only in the Hebrides "is the food obtained by the peasant
[511] occasionally so scanty" as to be unable "to maintain a
[184] labouring man in vigorous health". Inquiring why there should be so great a difference between the Shetlanders
175 and the Hebrideans, living in similar, distant isles, he
178 wrote, "We think the answer may be given in one word—
197 *language*. . . . The population of the Hebrides cling to their ancient Gaelic with consequences most disastrous to
182 themselves. . . . It handicaps them in the race for life . . . is a hindrance in the cities and a check to the emigration of both sexes to those world-wide regions where all who speak the English tongue find themselves at home."[1] He concurred with the Census Report of 1871, which stated: "The Gaelic language may be what it likes, both as to antiquity and beauty, but it decidedly stands in the way of the civilisation of the natives making use of it, and shuts them out from the paths open to their fellow-countrymen who speak the English tongue". The Report concludes: "It ought therefore to cease being taught in all our national schools. We are one people and we ought to have but one

Lewis and Harris

423 In May 1918 Lewis was bought by Lever of Port
565 Sunlight, then Baron Leverhulme of Bolton-le-Moors (his birthplace), the head of a great combine with 50,000 white
157 and 25,000 black employees. Meeting him in Lews Castle
124 in August 1919, Dr. Hardy and I found him troubled by a human situation he had failed to diagnose. Short and stocky but very erect, quick-eyed and rapid of manner, and with a wide expressive mouth, he spoke earnestly of his plans; but his eyes flashed and his mouth set, as he rapped out, "They keep putting off, yet they leave the people in houses *not fit for Kaffirs*!" The question, "What objective inspired—or misled—Leverhulme to buy the Island?" is answered by his son and biographer.[1]

159 By 1917 Leverhulme had felt it was time to devolve
423 his personal authority over his business, in the interests of its future. Hence he looked about him for an estate
• 433 in which he could exercise "his passion for changing the face of nature", and his eagerness for 'planning' with drawing board and T-square, and for philanthropy.[2] He nearly bought an estate in the Midlands in order to develop it; but work had already begun there, and he wished to find a place which would be his to remodel from the start. Thirty years before, Leverhulme had visited Lewis and now in 1917 he spent a week there, motoring all over the Island. "He was enraptured . . . he saw not merely a countryside in need of more and better roads, not only a residence and grounds capable of alteration and improvement, but a problem to be solved, a human and racial problem which had so far baffled all who had tried to solve it. . . . He had been told the Lewis man was lazy,

Lewis and Harris

159 stubborn and suspicious; he never believed it. He realised
423 that the backwardness of the Island arose from lack of opportunity, and that opportunity he would do his best
• 433 to provide. Wherever he went he found the same story —things half attempted, nothing done." Leverhulme, one felt in 1919, wanted to do all he could for the Islanders. A greater man would have wanted to work not only for, but with, the Islanders. Then, even if the fisheries had been ruined, as they were, by forces outside his control, he would have shared a moral victory, not shared and suffered economic loss, with moral defeat.

174 In the Isles for centuries before, a family and well-tried
183 friends were valued above all other things. What was more, this was still true in the lifetime both of the elder men and
[178] the women he found at home, and of the absent men, at war. The foundation for this friendly life was a plot of
159 land and work to do, a home and the leisure to enjoy it.
433 Leverhulme, too, valued these things in his own way. He cared for human homes and gardens, and had proved it at
461 Port Sunlight and elsewhere. A pioneer of industry and efficiency, he pled for 'a six-hour day' and leisure afterwards, and he had done much to realise the ideal in his own works. Moreover, he was not without respect for spiritual values, freedom, and a congregation's right to choose their pastor.[1] All these things should have helped to put him into sympathy with Island life, and up to a point they did so.

159 It is clear that Leverhulme had considered the possi-
433 bilities of improving the local fisheries, village by village; and an engineer had reported on possible harbour improve-
228 ments at Ness, Barvas, and elsewhere. But he came to the

Lewis and Harris

159 conclusion—undoubtedly a sound one—that the most
• 433 effective action for commercial fisheries (as then known)
228 must be taken at one Island centre, Stornoway. As a direct result he considered how to feed the growing town, in particular how to give its children fresh milk. He saw the farms round Broad Bay ready to be turned to high-class dairy farms, if capitalised, and for this purpose they were swiftly scheduled in his mind.

159 "His early days were happy ones"—wrote his son—
433 "but they were not to last for long. He encountered the first obstacle on his path in the late summer of 1918, when
423 the Scottish Board of Agriculture declared its intention to take over the few remaining farms in the Island for crofts."
[647] By this declaration the Board spoke for many Islesmen in the Forces. The voices of Servicemen, not those of either a Government or a philanthropic millionaire, counted over-
[727] whelmingly, on the Island and beyond. When the war was over and the men came home, many set about examining their boats and fitting them up with motors, and in a few months the evening's departure for the fishing from Stornoway had lost some of the picturesqueness of the old, stately procession of sail moving out to the Minch at sunset, but had gained in efficiency as the motorised boats went puffing out to find the shoals, sure of return without delay after the catch was hauled in. Yet fishing was still precarious: there might be no catch, and even if there were, prices were a gamble. Hence many a cottar-fisherman wished to ensure a home for himself and applied for a croft, with his eyes on the farms. Farms were few, and not enough to go round more than some 10 to 15 per cent of squatters and cottars. Still, a promise is a promise: the farms were there, why not have them and be done with it? Knowing this feeling in the Island, aware of its support

159 in the country, and foreseeing that the only sure way to
423 avoid irritation, friction and law-breaking was to grant
the farms and have done with it, the Secretary of State for
• 433 Scotland and the Board felt that they could not withdraw
the Government's promise of land. The Secretary for
Scotland, Mr. Munro (later Lord Alness), spoke with
knowledge as a Highlander. A general promise of small-
holdings had been made to all Scotsmen in the Services,
and could not easily be set aside at the wish of one man,
then approaching the age of seventy, however well-inten-
tioned, wealthy and in earnest. Yet Leverhulme declared
that while he would relinquish farms on the west side of
Lewis, his schemes could not go on unless he retained
the farms on Broad Bay to supply fresh milk for Stornoway.
If the farms were divided, he said, he must close the whole
scheme forthwith.

159 Of his earnestness Leverhulme left no doubt. He not
423 only planned but set up a retail agency, Mac Fisheries, and
he purchased drifters and trawlers, the Mac Line, to fish
433 far afield and bring the catch to Stornoway, there to be
228 transhipped by his own carrying service. He set about
building model dwellings in Stornoway itself, each with
its quarter-acre allotment. 'Work and Wages' from
capitalised fisheries were his offer, in further token of
which, road-making and other wage-providing work was
[178] begun. Until 1920 the farms remained undivided. The
farmers, for their part, could only wait for the expiry of
159 their leases, or for the transactions by which their leases
would be foreclosed and compensation awarded. Prices
423 of stock were high at the time, and the valuation would
433 correspond to these. Hence tenants felt they could afford
427 to wait. Meantime crofters' stock wandered over their
farms—whether because of the wilfulness of the stock or

159 of the owners—but farmers knew it was futile to protest,
423 and they suffered with a wry smile and a shrug of the
shoulders. After all, most of the farmers had stayed at
• 433 home and their affairs had prospered, in war-time; whereas
427 all but the older crofters had had years of seafaring or
fighting, and the nation's debt to them had not yet been
forgotten. The farmers kept quiet and waited.

159 Meantime, Leverhulme made public war upon the
Government. Speaking in Edinburgh in November 1919,
668 he declared that "Reports, thick as leaves in Vallombrosa,
433 have been the dominating feature of Government policy
in the Highlands and Isles . . . but the invariable rule
seems to have been, whenever expenditure of public money
was recommended, for the Government either to ignore
such reports or to cut down expenditure so penuriously
as only to result in waste . . . by not spending to the
full amount . . . Lewis and Harris have too long been
[213] the Cinderella in the Government pantomime."[1] The
crofters, reading this in the daily papers, and again in the
weekly *Stornoway Gazette* a day or two later, chuckled
with glee, rolling the phrases on their tongues. They
might not all have been able to explain the strange words,
like Vallombrosa or Cinderella, though they sounded fine;
but all had heard of pantomimes, and some might even
have seen one, without saying too much about it to the
minister. About 'penurious expenditure' they could
have no doubt. Yes, a fine speech, they felt! Yet in
spite of the sting of truth contained in such orations, these
did not make it easier for Government to co-operate with
the orator, to prevent raiding or to deal with it should it
begin.

000 Raiding did begin in the spring of 1920. Applicants

[1] Lecture at Edin. Phil. Instn., 1920. Quoted in Leverhulme (1927).

669 for crofts in Tongue, a township north of Stornoway, took
423 the law into their own hands, seized one of the fields of
the adjacent farms, and threatened to take the remainder.
It is easy to understand that when a man has come home
from the war to his sweetheart, and after being promised
a site on which to build a home (even a black house for
a start), with a plot for potatoes, and 'a cow's grass', a
year's vain delay may breed impatience! Leverhulme
motored to the township, and with his customary vigour
and persuasiveness spoke of his plans for 'work and
wages' to be concentrated at Stornoway. He again de-
clared that if the farms were divided this would cripple
his schemes, and work would stop at once. The majority
there agreed to fall in with his plans; in any case, only a
159 minority could find crofts on the farms. Leverhulme felt
• 433 that he had carried his point. He forgot not only that
his oratory deserved applause and had won it for its own
669 sake, but that the people could not lightly afford to say
'no', if this meant immediate stoppage of wages. It was
the after-thoughts on the morrow and in the following
months, rather than agreement at the moment, that signi-
[228] fied. In 1920 herring fetched a fair price, the herring
fishery prospects were encouraging, and work was resumed
for a time. Yet one raid having begun and "the die having
been cast, lawlessness spread rapidly". Leverhulme
stopped expenditure, and obtained an interdict against the
[423] 'raiders', though he did not prosecute. After further
654 parley, the Secretary for Scotland agreed to suspend
159 division for ten years, and in 1921 Leverhulme resumed
433 operations. "Unfortunately very soon afterwards", wrote
his biographer, owing to "the general industrial depression
which followed the boom in trade after the war", Lever-
458 hulme felt impelled to close down work for the time being,

159 and he was unable to make plans or promises for the future.
• 433 Meantime, it should be said, the Island herring catch and
458 prices fell rapidly (the catch by 50 per cent and prices by
[228] 60 per cent from 1920 to 1921). As a result, crofts now
seemed more precious than ever to the applicants.

159 With what Leverhulme regarded as 'almost indecent
haste', the Secretary for Scotland proceeded to fulfil the
423 promise to divide the farms. Most of the farms remaining
654 were divided into some fifty crofts, of ten acres or so with
outrun, supplying little more than 10 per cent of the
landless men. The Manor dairy farm, near Stornoway
Castle and town, though raided by a few men, was retained
to contribute to the town's supply of milk, along with two
or three smaller farms close to Stornoway (Melbost, and
Stoneyfield with Holm). Leverhulme felt that his offer to
Lewis had been turned down, and he then concentrated
his efforts upon Harris.

159 At the extreme south of Harris (midway along the
433 south-west coast), in the 'Hope' or natural harbour of
Obbe, Leverhulme built new piers. He transferred the
228 machinery of the canning factory and the kippering sheds
he had commenced to build at Stornoway. He started to
build houses, a number being provided on generous terms;
and "at the people's wish", the settlement was renamed
Leverburgh. With the transference of his energy from
Lewis to Harris, Leverhulme's "optimism and determina-
tion were intensified", wrote his son. They were not to
last long. After a visit to the Congo in 1925, Leverhulme
died suddenly in Brussels. How far the new plans might
have succeeded had Leverhulme lived, his son has com-
mented, "remains uncertain". What is certain is that the
second Lord Leverhulme toured Harris, visiting the works
on hand and examining the accounts. No doubt he also

159 weighed the estimated expenditure necessary to complete
the unfinished projects, and their prospects of success,
• 433 comparing these with similar conditions on the East Coast
228 and at Fleetwood, and with the trend of prices. His
decision was to close the venture, and Harris was sold.
[423] The skeletons of the works were left to rust beside the
quay, while the wreck of a coal steamer was left unsalvaged,
to break up slowly upon the rocks outside, a symbol of a
lost enterprise.

2. *An All-Round Policy for Sea and Land*

185 From the 'start' in Lewis, the first Lord Leverhulme
had shown his vision and grasp as a planner. Survey pre-
ceded plan, and decisions were swiftly put into action.
185 Why then had abandonment and failure followed? Per-
114 sonal factors have been over-stressed. 'Crofters' have
been accused of stubbornness, the Scottish Office of
procrastination and Leverhulme of impatience or obstinacy.
Stornoway shopkeepers have also been apportioned their
share of blame; and while all of them welcomed the
advent of Leverhulme as sure to bring money through the
crofters' pockets to their own tills, it is possible that, later
on, some of them did prove Devil's Advocates, having
come to fear the rise of competition by co-operative or
other large-scale concerns, should the town expand at a
[181] rapid rate. Stressing other factors of character and incom-
patibility, one popular Scots author went so far as to praise
the Lewis crofter for preferring a spiritual life with poverty
on a croft, to easy work and high wages in a town. There
runs a story, well vouched for, which might seem to con-
firm this. After Leverhulme had held forth upon 'work
for wages', in a township where there had been pressing

185 applications for shares in the division of a farm, but where
114 Leverhulme now felt sure of his success, an old crofter spoke up slowly: "My Lord, what the crofter wants iss
185 *Contemplaition*". Now, fondness for contemplation is
114 found not only among crofters as they age, but among older fishermen all round the shores of Britain, even if it
181 mellows in the Isles especially. Yet, as Leverhulme saw for himself, there was abundant activity among men in their prime, as they strove to refit their boats on their return. In 1919 hope, not contemplation, was their prevailing mood: hope for an active, fisherman's life.

With all these hopeful human factors on the side of common effort at the start, why then did differences of view-point come to be accentuated, not harmonised, and 'incompatibilities' lead so soon to friction, deadlock and
159 breakdown? Surely one basic fact remains. In 1917–18,
433 when Leverhulme framed his policy and made his plans,
228 the Scottish fisheries, to judge from pre-war years, could still expect to hold high place in providing for a brisk
[435] market in herring and white fish. True, the value of the Island cure of white fish had fallen from £100,000 in 1900 to one-tenth, £10,000, in 1913; but Leverhulme saw that since fresh fish were now demanded, his capitalisation of equipment with accelerated transit of the catch should bring quick recovery. The herring trade had been active at Stornoway up to the eve of the war; and although the Islanders had made leeway following the introduction of steam and of larger motor drifters, Leverhulme thought he saw an opportunity to capitalise the industry, providing 'work for wages'. This forecast was wrong. Consumption declined, and the market fell. Not only so; the proportion contributed by Scots fishermen to the shrinking market declined even more.

185 In 1919, when the men came home to Lewis they could
727 still see reasons for hope. They found a strange proprietor, known first for his outstanding—some said ruthless—
[157] business ability, and only secondly for his philanthropy. They heard his plans and were inclined to listen.

185 Yet, remembering their pre-war losses and the notorious fluctuations of prices and employment in the fisheries, they wished for a policy of insurance, as it were; so, if their home lay near a promised farm, of which they had long
159 meant to claim a share, they claimed this forthwith. Only too soon after, in the early years of Leverhulme's adventure,
458 the fall in total sales and prices of fish brought immediate
433 loss to the keenest and hardest working of the fishermen,
228 and to their financial backers in Stornoway. These losses warned others of the uncertainties of fishing. Now the fall in the fishing industry is not so much as mentioned in the biography of Leverhulme; nor do we remember a
[654] word of it in Leverhulme's speeches. One finds no data to show a substantial endeavour by the Scottish Office to co-operate with Leverhulme in framing policies either to change the trend of European markets or to make local adaptations to combat downward trends. The Fishery Reports certainly record the losses, year by year. As for the Island fishermen, they shared the feeling expressed by other Scots fishermen, that the old markets across the North Sea, eastward to what had been St. Petersburg, could and should be reopened, not closed 'for party reasons' by 'English politicians'. Although ostensibly Leverhulme ignored it, he cannot really have been unaware of the effect of the downward trend of the fisheries upon his own prospects of success, and upon the hopes and confidence of the fishermen. Having been so outspoken upon the shortcomings of Government with regard to local

159 schemes, and knowing how much local fishing depended
458 upon international policy, particularly the resumption of
433 trade relations with the chief customers of the past, Leverhulme, one feels, should have dealt no less outspokenly
228 with these. The removal of trade barriers lay not in the
[656] hands of the Scottish Office or of Scots officials (however internationally minded these might be as private citizens), but in the hands of Ministers of Cabinet rank and leading financiers, of whom Leverhulme himself was one.

In brief, the Scots fisheries suffered after the war as
458 neither Leverhulme nor others had foreseen when first
433 he laid his plans for the Island's prosperity. It seems
228 clear that had this major change been squarely faced by Leverhulme and Government alike, in 1920, 1921 or
[423] even later, they could never have fallen apart about a relatively minor issue, that of the farms. Both sides turned their faces away from this disquieting factor of the Baltic markets, though both knew it to be fundamental to the success of Scots fisheries and the Island's future. Had they faced it together frankly, then, even if powerless to effect a remedy, their sincerity might have prevented a deadlock upon a secondary matter.

159 To Leverhulme, given his large scale of expenditure
423 and return, the division of a few farms formed a minor issue. But to a number of ex-Servicemen, 'crofters'
185 without a croft, the division meant a home and relative
433 stability. Moreover, what was merely a matter for personal decision to Leverhulme, was a lifelong issue to many people
423 brought up in congestion on the wrong side of the boundary
[438] fence. Meantime, milk from Easter Ross was available in Stornoway, at town if not at country prices. Lastly, further possibilities of land-development lay open to Leverhulme,
[114] though not so readily to the unaided people. In reading

114 reports of early speeches by Leverhulme, Professor Patrick
185 Geddes had quickly come to feel that his old acquaintance,
473 Leverhulme the industrialist, might have overlooked such agricultural potentialities as existed, and that he had quite
433 overlooked the social significance of land. Hence, in May or June 1919, Geddes proposed that a survey be made by one who knew the Highlands botanically, who was experienced in agriculture, and who had some knowledge of Highlanders at home and of sociological factors. Geddes
[123] suggested Dr. M. E. Hardy for the task. Leverhulme forthwith accepted the suggestion and commissioned Hardy, whom the present writer assisted on the Island.

311 Examination of the farms, so hotly debated, showed that they possessed little or no initial superiority over neighbouring crofting settlements. That the farms were placed in the best coastal tracts for agriculture is true, but their shores are at the same time the poorest in harbours and fishing facilities. As a result, the crofters dwelling near the farms along parts of the same machars and smooth slopes were 'crofters' who sometimes fished, rather than fishermen with a house-site and a potato patch. As Hardy wrote (in his MS. Report): "The chief superiority of the farms resulted from levelling, drainage and enclosure" by landlord and farmer, sixty or seventy years before. The improved land both of farms and adjacent crofts was reclaimed from peat and machar, or from an admixture of both. "How then", asked Hardy, "did so much value
[423] come to be attached to the farms? The traditional grievance (of eviction) led neighbouring crofters to turn their eyes towards the green patches of the abandoned villages and endowed the old land with special virtues. After the Crofters' agitation of the 'eighties, successive Boards came with their eyes already focused on the farms, by the

311 cottars' claims." Thus a few of the settlements reclaimed
423 out of the common peat by some scores of people, hundreds of years ago, long worked by joint tenants, then by subtenants, "and later turned into modern farms, came to be regarded as the only available land open to crofters in the Island".

311 Hence, Hardy concluded, it was important to tackle
433 some reclamation of peat or of land partially covered by peat, along with the development of the main commercial industry, fishing. The specialisation of commercial fishing was "a wise, indeed an indispensable preliminary step" in a constructive policy framed to deal with the Island as a whole. One saw that the formula "All Lewismen are fishermen" was an exaggeration, and that some of those whose forebears had dwelt by the machars of Broad Bay for centuries were landsmen first and seamen
185 second. Yet the specialisation planned by Leverhulme
311 would not only have given a chance to the seamen of Ness,
311 Eye Peninsula, Lochs and 'the Bays' of South Harris;
[433] it would also have begun to relieve congestion, giving a croft and outrun to some of those who wished to make smallholding their principal means of livelihood and life, and providing a market for fresh produce on the Island itself.

Looking back, it seems clear that Hardy was right to report to Leverhulme (in 1919) that, while the great fishery scheme was indispensable, it should be complemented by a scheme for occupation on the land for those who wished it. The major problem of land being the amelioration of peat, continued Hardy, it should be tackled with twentieth-century knowledge and equipment. Slopes were to be found, favourable to reclamation, where peat had been thinned by cutting, where it was shallow from good drain-
[433] age, or lighter in texture from admixture with sand. Had
[159]

185 Leverhulme grasped the problem in this fresh way, comple-
311 menting his first policy of the sea for the seamen by one
433 of the land for the landsmen, he could cheerfully have
allowed the Government to honour their promise to divide
159 the farms, and thus he would have brought peace to all.
In giving up the farms he would merely have had to reconcile himself to additional imports of fresh milk from Easter Ross, at an extra cost of a penny or two per pint. To do Leverhulme justice, experiments on peat were begun (about 1920) upon a small scale, partly, it is understood, as a result of Hardy's report. Yet in failing to make this reclamation an integral part of his plans, in refusing to adapt himself to promises given and to agree to the wishes of many applicants, Leverhulme of the Lews allowed peace to be wrecked. Why he should have stopped work in Lewis in order to remove to Harris, is not clear. There is nothing to show that crofter-fishermen in the creeks of Lochs and other fishing tracts of Lewis believed less firmly in fishing than their fellows in 'the Bays' of South Harris.[1] Nor was there extensive land for dairying in Harris. To make a second attempt to found a centre, involving fresh expense, at Obbe (on the exposed south-west coast), a much less favourable point on the Island than Stornoway, was to court disaster, not to pilot his way through the difficulties of falling markets to success.

185 Leverhulme, it is true, had seen one side of the 'all-
311 round' policy required: the need for a plot of land for the
Lewis fisherman and his family. In Hardy's words, "A
(114) man's choice of the sea should not prevent his having 'a

[1] In his father's biography, the second Viscount suggests that there was
(828) a difference of character between the (unreasonable) men of Lewis and the
(reasonable) men of Harris. The assertion is unsupported by the facts.
(829) There were raids in Harris, too, comparable to any in similar tracts of Lewis, but in neither were they important.

185 corner he can call his own', a kailyard or garden. His
311 womenfolk might wish to keep poultry, and even a cow.
(114) More than this . . . might tend to make the old amphibi-
ous life begin over again." Where Hardy went further was to see the need for a complementary policy; the development of crofting into skilled small-holding. "Similarly," he went on, "the development of small-holding, by one who chose the land for a career, should not prevent his spending a leisure hour fishing from the shore, or in a neighbour's boat, for haddock, saithe, or flounders for the morrow's dinner. Yet the wish and need for a higher standard of living involved new emphasis on one chosen vocation, and a greater division of labour than heretofore,"
311 whether on land or sea. Some division of callings already existed, be it remembered. Manifestly, in the virtual absence of arable land for them, about 1500 cottar and squatter families had perforce to depend mainly on other occupations than the land. These families included the keenest, most successful, and potentially prosperous fishermen, like those of 'congested' Scalpay (off Tarbert, Harris). The useful "Remarks" formerly published along with the "Creek Statistics" of the Fishery Board, repeatedly contrasted the townships and creeks mainly concerned in crofting with those mainly occupied in fishing. The contrast is to be found from the Shetlands round to
(159) Barra or Kintyre. Leverhulme, seeing a future in the
(433) fisheries, tried to give the almost landless seamen their chance at sea. Had he accepted the complementary policy of giving a number of the now boatless crofters a better croft and means to improve the outrun, his schemes would have been complete.

114 It is a misfortune that Leverhulme's one-sided policy
159 had already hardened in his mind when Hardy (and the
433

159 present writer) came to the Island in August 1919, and still
433 more by November 1919 when Hardy's Report had been completed. Leverhulme had begun to fight for his plan,
(114) rather than use it in a supple way. Yet there was still a chance to put things right had the concept of a balanced
(185) community been clearly visualised by Government and people, by working fishers and crofters and the educated. Had an active 'Lewis Association' existed at that time, it might have turned the scales.[1]

Lastly, during the war and after it, Leverhulme had said, again and again, that it was his admiration of the people which had called him to the Lews. By means of this 'all-round' plan, the very root of Island character
185 could have been renewed, namely, communal life. It was
311 with their communal life in mind that Hardy—in spite of his horror of bad husbandry and of the physical dirt of
114 the byre and black house—wrote, first, that "rural re-

114 [1] Quotations from the MS. Report having been published (apparently without permission, and with somewhat misleading criticisms), reference should be made to these to illustrate the need for survey and collaboration with Leverhulme in the first three years of his proprietorship, and the importance of survey for action today. In 1919 Mr. W. C. Mackenzie (to whose historical researches lovers of Lewis owe so much) had published his belief that "Under the new proprietorship . . . the results [of development] will be at once fruitful and far-reaching", without his making any constructive comment. By 1932 he wrote very differently, criticising Leverhulme's policy and also Hardy's (qualified) approval. At that later time, Mr. Mackenzie would have it that 'the Lewisman' was a crofter and fisherman in one, and that for him to become 'mainly a fisherman' or 'mainly a crofter' (in Hardy's words) would be false to his character and tradition. Now, historically, the element of regional specialisation is ancient in the Island; the crofter-*fishers* of Lochs, Uig or 'the Bays' of Harris have long been rather different from the fisher-*crofters* of Barvas, or of Coll and Gress. Specialisation was strongly marked by 1914–19; it still is. Further, Hardy (and the present writer) had not pled for complete divorce of the two vocations of sea and land. We urged that crofting be given its chance as well as fishing; and that the two callings should be complementary. Allowance being made for a quarter of a century of changes, the facts and the need remain. Cf. W. C. Mackenzie, 1919 (p. 187) and 1932, for the quotations given.

185 construction of the Island must rest upon the improveme
311 of the land": and secondly, that by this means "it v
114 imperative to revive the traditional community spirit, t
essential feature of Hebridean civilisation". Those wo
still hold good. Yet the land itself is too barren and t
soil too poor to provide a living for many by export
(438) fresh agricultural produce to the mainland. Only a lo
market could pay a fair price for most of the products
159 intensive small-holding. Judging from the free, untra
433 melled trade before 1914, Leverhulme held that fishi
could be set upon a commercial basis in the Isles; a
228 there could be few better judges of commercial possibilit
438 than this keen industrial thinker and organiser. If he w
right, as surely he was, to begin with, then the local mar
to be created, or rather enlarged by growth of populati
and prosperity at Stornoway, could have purchased t
fresh milk and eggs, the fresh greens and fruit, raised
enlarged small-holdings and marketed co-operatively.

181 A final comment remains to be made. The commun
476 spirit of Scots fishers from Berwickshire to Barra has go
far to make co-operation among the men of the crews
living thing. 'Work for Wages' offered little outlet
this, indeed it virtually suppressed it; and 'co-partne
ship' on the Port Sunlight model was a very differe
matter from the co-partnership of a crew. Even if at th
time it had been proved impossible to organise free c
operation in fishing, co-operation in small-holding tow
ships might have kept the communal spirit alive, for lat
renewal at sea.

114 It is not easy to assess the after-effects of Leverhulme
433 activity. Leverhulme certainly helped hundreds of famil
by the provision of wages for the building or rebuildi
of roads and other works, of which some were complete

Lewis and Harris

175 for a firmer hold upon the land and for a return to aban-
178 doned sites. The communal possession of joint farms, held
433 directly or under tacksmen, gave place to individual pos-
(731) session of crofts. Yet the legal recognition of perpetual
(166) tenure in 1886 gave not only the crofter's home but the
(167) crofting neighbourhood a security unequalled in Britain.
175 The use of moor and machar in common was retained;
178 but its control for improvement or reclamation by the
423 estate or the township was weakened, rather than strength-
427 ened, by the Crofters' Acts. Confusion grew—both upon
the arable land, subdivided, unenlarged and unimproved, and also upon the common grazing, sorely overstocked in spite of ever diminishing 'soumings' (or family shares) of cattle. Rating difficulties and anomalies appeared. Communal discipline, maintained at sea by fishing, was weakened on land after the abolition of the joint farm-group, and almost nullified in the townships by subdivision and squatting.

175 A year before the potato famine of 1845, a new landlord
178 had brought good-will, capital and pioneering effort to
433 Lewis. These had been directed to experiments in the
(427) reclamation and the industrial utilisation of deep peat.
(311) Helped by employment on these and other works, the
(161) population of Lewis continued to increase, when increase in Harris was arrested for a generation. Yet while neither experiment with peat met with success, little aid had been given to develop fisheries. In both parts of the Island a growing population was supported from the 'seventies onwards by help of earnings derived from the seasonal herring fishing on the East Coast and from inshore line fishing at home. Women added to the Island income by
(167) seasonal 'gutting' and, in Harris, by their spinning and weaving. Money was earned by work on the mainland,

small savings, if any, have been put to the purchase of fishing gear and boats, for fishing, too, was summer work. By 1833 the poverty of the Outer Islesfolk and the bankruptcy of the landlords were such that Parliamentary attention was called to the state of the Hebrides. Poverty continued to be extreme, but need turned the people to fishing. The loss of revenue to the lairds led to their making sheep farms—somewhat unwillingly—with local evictions: in Lewis chiefly from Park and from north of Stornoway, and in Harris notably from the western Machars to the eastern Bays. In spite of this, it also brought about the sale of Harris by Macleod, and finally of Lewis by Seaforth in 1844.[1]

(B) NEW OWNERSHIP AND CAPITAL IN LEWIS: 1844–78

Lewis was bought by Mr. James Matheson, a gentleman of Highland family, whose fortune had been made in China. Sir James (as he became) put much capital, effort and goodwill into the management and improvement of the Island. Of the amounts expended we may distinguish, so far as possible, what he spent as a rich man for his private pleasure from what he spent for the people. No sooner had Matheson bought the Island than the 'potato famine' of 1845–46 broke out. The terrible loss of life in Ireland, and the depopulation of that country which followed, would have been equalled in the Isles but for the action of landowners like Matheson—who were the descendants of 'kinsmen', not of alien conquerors—and also of subscribers

[1] A sketch map of Harris showing the areas cleared (1816–54) and areas settled as a result, together with those re-settled by government help after 1900, is given by J. B. Caird, *Scot. Geog. Mag.*, vol. 67, 2, 1951, p. 94.

grants, then, in the absence of an immediate goal, the combination of the corporate interest in bad work with natural inclination to an easy time proved overwhelming! The problem of assuring good work and prompt repayment is real: it calls for the right appeal to team-spirit coupled with personal responsibility. Many short roads to small new settlements have been economically built.

With regard to loans for settlement and housing, similar contrasts are found. Near Stornoway the farm of Aignish (Eye) was divided in 1905 into thirty-two fishermen's holdings (rented at £3). The Congested Districts Board lent £3600 for housing and spent £1600 on fencing and £450 on administrative expenses, a total of about £180 per holding; but in seven years the holders had paid only one-seventh of the annuities due, and were in arrears with the rent.[1] Yet on the housing loans made on a wide scale since 1919, there was mutual aid among neighbours and the repayment has been satisfactory.

SUMMARY: 1750—1914—1919

The transition from the old economy of mutual aid in self-support, little changed down to the 'Forty-five, to the development of production for sale had proceeded far by 1914. Yet change had not continued steadily. There had been fluctuations, from the land and back again, or towards individualism with returns to common action. Kelp-making, migration, and commercial fishing alternated in importance as means to earn a living without losing the anchorage of home. After the potato famine, a century ago, the people tended to move away from the outlying townships and emigrate; but the next generation agitated

and are of lasting advantage. Yet his projects were conceived impersonally, apart from the people, and to be valued in terms of money alone. Was it to be wondered that more permanent values were liable to be overlooked? Immediate payment and the prospect of further wages rather than a home to build and a boat to adapt, suggested immediate pleasure, for example. The unsettling influences of War, and the natural wish for a big spree after four years of it, led to some squandering of money; and there was heavy drinking at Stornoway by fishers there and from round about. In the end, when payments ceased, the prospects of the crofters and fishers were as barren as ever. Above all, the somewhat conservative though sensible outlook of the people having already been disturbed by the impact of War, their sense of values was further shaken by seeing the control of immense capital resources in the hands of one man, whose efforts seemed, by comparison, to dwarf their own independent struggles and group co-operation. Of definitely spiritual values little was heard, for 'enlightened self-interest' was Leverhulme's declared motive in life. Remembering this, there are men and women of insight in Lewis today to whose judgment a lifetime's disinterested work with the people gives some authority, who believe that in the end Leverhulme's incursion brought little lasting good. Leverhulme certainly showed how to plan boldly and on a great scale. He drove straight for a vital issue, but in an ill-balanced way. The result raises a major question. Can balanced planning be achieved by one man whose personal fortune and pride are at stake, in opposition to a free community, and in face of an international situation of which the prime social issues oppose his desires and declared principles of 'enlightened self-interest'?

of new steadings. The average amount of loans (totalling £166,000) was under £150; repayment has been satisfactory, and the arrangements made by the Department of Agriculture won general praise among the people. Yet 1200 houses were very far from replacing all the 'black houses', and many more are needed.

In terms of cash profit, ten crofters today run their crofts less remuneratively than the farmer they dispossessed; even together they may show little more total production than the farmer. Nevertheless, these ten crofts each allow a part, at least, of the basis for a country home. Hence the weight of public opinion supported, nay, insisted on 'giving back' the land to the descendants of those who had worked it sixty or a hundred years before. The State bought the farm stock at a high valuation, and till lately without adequate reform of crofting use and wont. The farms having now been divided, a great emotional issue, which had smouldered for half a century, has been brought to an end. Although the practical results are small, the crofters feel that justice has been done, and that fact may be a great gain. Now that there is no more green reclaimed land to be had, the reclamation of the peat moor, or the grey 'skinned' boulder clay has to be faced.

By financing the renewal of Leverhulme's brief attempt to reclaim deep peat on Arnish Moor, south of Stornoway, the Canadian, T. B. Macaulay, made a resolute attempt to solve the island's main agricultural problem. Good crops were grown, potatoes and silage produced, and a dairy farm established. But the difficulties called for continuity of effort and research. From the practical point of view of 'demonstration' it had been a mistake to tackle deep and almost level peat, black in colour and viscous in consistency. There was not the light machinery required for cultivation.

left the Island. Yet after 1931 many returned, owing to losses and unemployment both in British towns and overseas. When emigrants began to come home the 'Harris' tweed industry had spread to Lewis and offered increasing employment. Some men still fished in family-owned Island boats, and others as paid hands (on boats from the East Coast), though losses and unemployment were suffered.

Inter-war changes were hastened not only by movement beyond the Island—an influence at work for three or four generations before—but by mobility within it. In 1919 a small mail car made its way daily from Stornoway along each of the five main roads, with an occasional passenger. When crofters crossed the Island to Stornoway they went on foot or took the pony and cart at a slow walk: it was a day's journey. Ten years later, Ford vans, bought second-hand, ran daily to Stornoway from every township. Frequency, ease and relative cheapness of movement came late in an Island with no railway: the mobility of the motor for marketing and shopping brought rapid change.

'Hand-loom' weaving had become an important, if precarious, resource, important because of the capital invested and the labour employed, yet precarious because of its dependence upon name and sentiment, not only upon intrinsic value. In Harris many women had spun and woven for sale for over a generation before 1914, mostly weaving pure hand-spun yarn, and they continued to do so. For many years before 1914, an occasional weaver was to be found in villages in Lewis too, generally weaving a handspun weft upon a mill-spun warp. By 1939 it was estimated that there were about 1200 looms in the Island, chiefly weaving mill-spunyarn, most of it spun in the two principal Stornoway mills. A carding mill

(c) THE OUTLOOK: 1939–54 AND SINCE

How then can the situation be assessed, as it was before the outbreak of war and since then? By 1939 twenty years had been partly lost; for the after-war years of the 'Leverhulme boom' were followed by discouragement and poverty. During that time one might have hoped for half a generation of reconstruction and progress. On the other hand the sore question of dividing the farms was settled, so bringing raiding to an end. Congestion on the existing crofts is less than it was, owing to this fact, and to the provision of feus. The poverty of many breadwinners who had migrated to the cities first cut down the amounts remitted to their Island dependents, then drove them home. A croft, or even a garden site, and the opportunity of building a good house there made life still worth while, when other employment had failed. Unemployment relief, though tempting some to idleness, gave a respite which many utilised to make a fresh start. As fishing waned, many had taken advantage of the easy beginning offered to learn a new trade—weaving. This has made many feel that the living to be found on the Island is better than alternation of 'wage-earning' with unemployment, in Glasgow or abroad. They believe the situation of the Island community to be hopeful. While the land remains little better than before, many, even of the younger people, still care for the Island life among their own kin. Given a clear lead, these could reorganise themselves, and undertake the developments needed in fishing, weaving and reclamation. The homes are sound, 'good neighbourhood' endures, and given fresh opportunity, the community could awaken to new life.

During and since the war, co-operative marketing was

For a year or two after the war many men and women returning from the Services, the sea or the factories found employment in the flourishing Harris Tweed industry. This included work in the spinning mills and hand-weaving at home—work in which the male weaver was helped by his family in jobs such as bobbin winding. Few fishermen dared to sink capital in new boats and gear, and risk losses such as those sustained after 1920. Few women wished to return to the hard, uncertain work of gutting. The whaling station, built on West Loch Tarbert before 1914 and open for a short time between the wars, was reopened in 1950, and employed some 30 men for 18 months before it closed in 1952. Crofting was lightened by some mechanised cultivation. The war-time construction of air-fields had ceased, though some harbour-work and road-making was assisted by government grants.

In 1949 the Harris Tweed industry, now the Islanders' main source for earning, was crippled by the imposition of a 66⅔ per cent purchase tax on hand-woven Harris Tweeds. Parliament decided that as a non-utility product, its export sales alone could be exempt from tax. Viewing the position of the tweed industry in Britain as a whole, there were strong arguments for the extension of the tax to Harris Tweeds: the high-grade industry of the Scottish Border or the manufactures of the West Riding should not be subjected to unfair handicap. At the same time the crippling of a handicraft practised by peasant or artist favours mass-production to the loss or ruin of traditional and experimental workmanship or design to which, in the end, the mass-production is an unacknowledging debtor. The obvious economic handicaps of Island hand-weaving may surely permit some latitude. The export trade in Harris Tweed, in which the imponderable 'sentimental

value' is important, is an appreciable dollar-earning asset; and because of the fluctuating export market, its manufacturing must be stabilised by sales at home.

These and other facts support the plea that if some share of taxation had to be imposed in the national interest, it should have been done by steps to permit of readjustment in manufacturing and of adaptation to the carefully fostered market. What seems indefensible, even in the national interest, was the imposition of the full 66⅔ purchase tax. As a result of this blow, the crofter's web could not be sold, and lay, a prey to moths, in his home, while the mill-owner's stock piled up in the warehouse. 'Hand-looms', newly bought or partly paid for, lay rusting in the sheds and the machinery of the mills stood idle. The hand-weavers with their helpers and the employees in the mills, their savings spent, began to seek work beyond the Island. As the census of April 1951 has shown, the population has been falling as workers trickled away by every steamer. Some adjustment was made, it is true, late in 1951; but the case of the small independent weaver remained as hard as ever.

The amount of tweed stamped with the Orb Trade Mark, which diminished slowly from 4,464,000 standard yards in 1948 to 4,101,000 in 1949 and 3,780,000 in 1950, fell when the tax was imposed to 2,800,000 in 1951. In 1952 there was a recovery, maintained in 1953. Over 5,000,000 yards will have been stamped in 1954.

APPENDIX III

(A) THE STORNOWAY TRUST: A COMMUNAL OPPORTUNITY

632 THE people of Stornoway town and rural parish are in a
175 position to control their own future to a degree unusual in
178 Britain since the general loss of common lands in the eighteenth century. Three or four bodies or groups are important in local governance, and in addition to these an effort to arouse
632 citizenship has taken shape in the Lewis Association. As else-
623 where, the Town Council acts for the burgh and, it should be added, the Grazing Committees for the townships, the District
423 Council and County Council acting for wider spheres. The
361 Harbour Trust has its special charge. In addition, the fact of corporate ownership is important, as vested in the Stornoway Trust. Besides property in the burgh and its suburbs, including the Castle and its park or policies, the Trust owns virtually the whole landward area of the parish, from Arnish Moor north to Tolsta. It should not be forgotten that the resources of the sea are public property and that the inshore fishings, owing to a considerable measure of protection, are virtually in the possession of the coastal communities. Freshwater fishing is also in the hands of the Trust. Thus, not only building property but essential sources of production on land and sea are in communal possession. The Trust was formed in 1924.

623 During the first five years of its existence the Trust was burdened with a growing deficit, but since 1929 it accumulated
• 433 a credit balance, due partly to agricultural derating and partly to the registration of the Trust as a charity and the resulting relief from income tax. Possession without prevision can do little, however; and hence the need for the citizens of town and country to regroup themselves as thinkers for the common

623 good. In response to this realisation, and encouraged too by
• 433 the growth and prosperity of the tweed industry, the Lewis Association sprang into being in 1942–43. The Association's aims are survey, planning and the initiation of action for the public welfare, economic, social and spiritual. Something should be said of each of these bodies in turn.

623 The membership of the Town Council, Harbour Trust and
633 Stornoway Trust overlap, the Town being represented on both
433 Trusts. Indeed by the conditions of the Deed of Trust drawn up by Leverhulme (in 1923–24), the Stornoway Trust must
361 include the Provost of the Burgh as its Chairman, together with Magistrates and Councillors. For some time past the Provosts and Councillors have been chosen from the more important
[369] business men of the town. Indeed as a result of the constitution of the Stornoway Trust, urban interests and outlooks might easily gain undue preponderance at the expense of rural needs. Nevertheless two members with strong rural ties were elected to the Trust in recent years.

In view of the growing burden of deficit, the Trust felt unable to frame a general policy, still less to carry it into action. To meet the deficit, the Trust sold portions of properties without reference to any general plan of town or country. Even after the Trust began to accumulate a favourable balance, hand-to-mouth decisions continued to be made, undirected by any clear policy. The most lamentable case occurred when a garage site was given to the chief Stornoway bus proprietor at a road junction near the western entrance to the town, close to the principal new housing schemes and opposite the main gate of Lews Castle and the Lady Lever Park. The palpable mistake in siting soon caused strong public criticism. The Trust repented, and sought to distrain the garage proprietor
[686] from extended use of the area. The parties went to law and the case was fought through the courts until, in a final decision reached in the House of Lords, the Trust lost and had to pay a bill of some £4000. The lesson of defeat in the court was severe, capped as it was by the equivalent of a fine of £4 or £5 from every family in the burgh. Coming at a time when the need

APPENDIX III

for planning preceded by adequate survey became publicly recognised, this crisis seems to have caused a change to constructive policy on the part of the Trust. It led to the election of a new member of the Trust on a planning platform, and to a general searching of heart and mind in the community.

Meantime the movement for town planning which had spread from the bombed cities to the rest of the country, led to a closer co-ordination of planning aims between the Trust and the Town Council, and there is real hope of progress in collaboration with the County Council as the statutory planning authority.

In brief, the opportunity arose for the Trust to frame a comprehensive policy, one binding together the objects separately listed in the Deed, " to promote the material and social welfare of the community ". The ' material ' provisions of the Deed allow for the promotion of industry—including fishing, of course—of agriculture and afforestation, and of communications by land, sea and air. Medical service is not forgotten. The encouragement of social life and education is foreseen, and bursaries may be provided to enable deserving scholars to proceed to secondary schools and universities.

It is felt by far-sighted citizens that these aims should be properly co-ordinated. Development of resources and social life, they feel, could be combined with education and training deliberately designed to equip young people to return to the Island and use their capacities to serve their own community. Thus among the development schemes which have been mooted are the reclamation of peat, the reclamation of the sandy inlet just north of Stornoway, and local afforestation. All these technical jobs require training, at the levels of engineer and skilled foreman or working hand. Bursaries might take the form of education for such rural tasks. The ' export ' of talent may be necessary when no outlet is possible at home, but in the end it can drain away the community's youth. Hence a policy for the return of talent is required. For fishing, for industry and particularly for the weaving arts, training is required in preparation for possible careers at home. Lastly

Figure 9.

/p. 20/

CONTINUED ON NEXT FICHE

CONCLUSION

121 The importance of the 'regional' movement is inter-
185 regional and indeed international. In the case of the
Island, international order is required for its fisheries to
438 recover, and for its weaving to find purchasers abroad as well as at home. This in turn could allow small-holding to find an Island market in its little burgh, Stornoway. Without this triple basis of fishing, weaving and crofting for its economy, Island society will break up and its culture
[182] vanish, not evolve. It is no less true that only by the best utilisation of each regional environment, economy and society as we find them, will profiteers be held in check at home, and powerful peoples cease to exploit the sweat of others.

121 A pioneer American Report acknowledges the debt of
171 regional survey for the New Deal not only to France and Germany, but to a group of practical idealists, of geo-
[185] graphers, biologists and sociologists in Britain.[1] If nation-
ally we can be proud of Scots and British initiative in
[433] planning, we must own, until recently, to humiliating
[184] slowness in its execution, and in the mobilisation of regional resources for social ends. The chief end of our planning must be the re-making of society. In Britain it is not always realised that in the great developments of the New Deal the execution of concrete schemes which include civil engineering, industrial expansion and agricultural conservation, is accompanied by real cultural achievements, both urban and rural. Not only are geographers and economists, technicians, industrialists, and officials called to survey and plan the Tennessee Valley, but sociologists and educationists are required to complete the work. Not

APPENDIX I

128 An effort has been made to separate crofting from other income, and also to average the income from the sources given of
433 the total rural households, numbering 4700, composed of those
162 on the 3650 *occupied* crofts plus an estimated 1050 others, namely, cottars and squatters, and 'feuars'—*i.e.* holding land in feu.

434 Finally, to the productive income earned on the Island there should be added that received by earnings sent or brought home to dependants, together with pensions, unemployment relief and the like. I am greatly indebted to the appropriate officials for the figures cited for 1937–38 or the year immediately preceding. These sources average £45 per rural household.
(128) The figures tabled all apply to Lewis alone; but many figures having been obtained for Harris also, conclusions are similar there. The concluding Table (pp. 314-315) bears a note on other sources of income, with a similar table for 1953.

(i) *Tweed Industry*

128 After deducting the cost of wool imported from the mainland and certain other costs, the net productive income was
434 taken to be £307,000. The estimate may still err on the high
288 side but it indicates the prime importance of the industry in the Lews. For 1938 the quantity of tweed stamped, and certified as hand-woven by the Harris Tweed Association Ltd., was 2,830,900 imperial yards, rising in 1939 and 1940 to 4,000,000 yards, though falling thereafter. The value of the tweed produced in 1938 was approximately £500,000. The total wages paid in 1938 amounted to £140,000 (£139,600), rather more than half of which was paid to the weavers working at home. In 1940 this had risen to nearly £200,000, a slightly higher proportion falling to the weavers.

(365) In addition to the wages paid and the price paid for local wool, the industry is a valuable customer of the Electricity Company and directly or indirectly provides much other employment
(651) in the Island. The industry also provided a market for a large quantity of Scottish wool and contributed to taxation.
(458) The productivity and earnings of the industry continued to

APPENDIX II

RECENT STATISTICS (1953–54)

128 In briefer form, the basic economic data can now be reviewed, in the same order, for 1953, or the period April 1953 to March 433 1954, as available. The results are shown on the second pair 434 of Tables, pp. 318-319.

(i) *Tweed Industry* (1953–54)

434 Taking 5,000,000 yards as the 1953–54 total, and accepting an estimate of 1s. 2d. paid to weavers per finished, mill-shrunk 288 yard, payments to weavers in Lewis-and-Harris (and a few in the southern Hebrides) would amount to some £291,700. After 463 subtracting the output from Harris, this corresponds to an informal estimate by the Lewis Association for Lewis proper of well over £250,000 and more, probably £275,000 for the period. Adding the wages of spinners in Stornoway mills, and also of carriers, dockers, etc., it is thought safe to double the figure, with £550,000, for Lewis, rural and urban. Most of the weaving is rural. The increased use of daily bus transport allows rural dwellers to come to Stornoway daily to earn and so has increased the ratio of rural to urban wages by spinning and other labour. For rural carriers and mill-employees, a fifth of £275,000 is taken here, making £55,000. As no estimate for the 'net earnings' in Lewis is available, the same ratio to wages is taken as in 1938, making £1,200,000.

(ii) *Agriculture, Peat-making and House Building* (1953)

178 (a) *Agriculture.*—First, the trend of crop and stock production can be indicated by selected figures for the Island for 434 1918, 1939 and 1953. The areas both of oats and rotation 241 grass increased, the three successive totals in acres being, for oats: 4460, 5020, 5440; and for rotation grass: 390, 1385,

An attempt has been made in
Figs 19 and 20 to relate the size of the stock carried on
231 the individual croft to the size of holding and to the availability and age of the labour force.
311 In both diagrams there is a significant division between the subsistence holding (0 - 7 units)
466 and the commercial holding (11+ units), but there is no definite relationship between stock
471 and size of holding or labour availability. The inclusion of the factor of equilibrium for
232 certain lines in Figure 20 reveals a somewhat unexpected state of affairs: in the case of
162 crofters with regular work and full time crofters, those years-of-age of forty-five carry a
larger stock from those under forty-five. It is frequently argued that the solution to the
economic problem of crofting lies in the amalgamation of holdings in order to create a
more viable economic unit, but the indication from these diagrams is that an increase in
the size of holding will not, of itself, lead to an increase in stock. It is the absence of
adequate markets that deter the crofter from increasing his agricultural production.

In their present state the crofts in the Valtos area are unable to provide a livelihood
for the crofter and his family. Of the crofters who are full time, almost 90% supplement the
croft income by other employment. Of these casual labour (at present mainly at the
Gisla hydro-electric scheme) accounts for 57% regular work - particularly weaving - 43%.
The combination of crofting and weaving provides probably the best return for the labour:
one crofter with a croft of 3.3 acres, carrying two cows, two followers and ninety sheep
(stats yours) made the following estimates for 1958:

231 FROM THE CROFT:	
234 Sale of two year-old calves	£80
Cow and calf subsidies	£40
Sale of wool at 4s. 3d. per lb.	£75
	£ 195 (1)
FROM WEAVING -	
at two tweeds per week (32 hrs. p. w.)	£550
GROSS INCOME	£745

436 Weaving about 30 hours a week apparently leaves him sufficient time to run the croft
467 satisfactorily: at present a crofter supplementing his income by a labourer's wage at Gisla
465 Hydro scheme would have to put in nearly sixty hours per week to achieve the
same financial reward.

433 The economy of the Valtos peninsula has been changing, and contracting, for several
79 years. The number of unoccupied crofts is increasing; commercial fishing ended at the
82 time of the first World War; the shielings have been abandoned as summer cattle pastures.
234 The Valtos shielings near Loch Scandale were abandoned during the 1939 - 45 war, due
mainly to the lack of manpower in the township, though some was used intermittently until
1953. The shielings of Kneep and Reef were abandoned in the late 1930's, at which time
Kneep had some fifty milk cows as compared with fourteen in 1959.

1 Against this figure, must be set the costs of production (i.e. fertilisers, new seed, winter fodder supplements, sheep dips etc.)

241 The area under cultivation has contracted in the past twenty years. Before 1939 most
croft land about twice as much land under cultivation and at Valtos some were cultivating
small patches outside the township fence. The cultivation of the common machair at Cliff
ceased in 1939. The land had been "too long in labour" (potatoes had been planted on the
same ground for nearly one hundred years), and the soil had been affected by over-liberal
applications of sulphate of ammonia which replaced the traditional seaweed-impregnated thatch
from the black-houses. Moreover the Cliff machair was particularly vulnerable to "blow-
outs" after ploughing. Cultivation of the Kneep common arable has all but ceased, and the
fifty-two acres of arable machair in the township of Reef have been untouched since the
1930s. It is noticable that the common machair cultivation and the shieling economy
ended about the same time. Smaller numbers of better cattle were needed to meet
233 the daily milk requirements of the croft: a much smaller area of cultivation was therefore
needed to provide winter fodder and consequently more land was available on the croft for
potato cultivation. Consequently the more distant machair was replaced by cultivation
within the croft.

433 Contraction and decline of the economy is common to all three townships, but the form
17 and cause of this decline is different for each, and where the township consists of two
or more settlement nuclei there is frequently a difference between the two parts:

632 The township of Valtos is in two distinct parts: crofts 1 - 34 are a succession of narrow
strips about ½ mile in length stretching from the shore to about 200' O.D.. The boundaries
427 of the outer crofts (nos. 1 and 34) if projected to a point on Pabay, form an angle of 45°.
434 Beyond this the crofts are narrower at the shore (60 - 70') than at the upper limit (100 - 180').
341 Of these 34 crofts, 19 are in so-called runrig, eight in pairs and one group of three. (Fig. 21).
Cultivation is carried out on numerous interwoven small patches, held permanently: the
249 gratings are interchanged at the year end. Fragmentation imposes a severe limitation
on the economic efficiency of the croft. None of the crofts at Valtos is individually farmed
241 Only the less steep areas are cultivated, to facilitate ploughing.[1] As a result, the bulk
of the cultivated plots are to be found at either end of the croft - near the shore and on the
hill top against the township fence.

The remaining five crofts of Valtos, and a squatter, are at Cliff in the valley separating
the Valtos peninsula from that of Aird. Here the crofts are fenced, more compact and
slightly of larger size (4.8 acres as against 3.8 acres) and they occupy gentle terrain than
249 those in Valtos. Two of the crofts are worked in runrig - these being situated on the
machair. The houses are set back about a hundred yards from the road, along the western
township fence.

Kneep township is again in two parts: Crofts 16 - 18 together with the Manse and two
cottars, are situated across the neck of the Glebe promontory, on the south side of the
peninsula. The five legal crofts are today worked as three units. Fenced, compact
crofts with little of exceptional size for the area - average 15.1 acres. Crofts
243 1 - 15 at Kneep on the northern side of the peninsula adjoin those of Valtos. Here is a
similar situation, which imposes severe limitations upon croft efficiency. Twelve
of the fifteen crofts are worked; of these only numbers 4 and 5 are compact homogenous
crofts; numbers 3 and 6 are compact except that part of the land which lies within their
boundaries belongs to croft no. 13. The remaining eight crofts comprise a hundred and
eight separate plots of crofland and fifty-two separate plots on the common machair.
One croft with 2.8 acres arable the average size of each piece is a mere 0.15 acres!
243 The grazing land on the croft is divided into strips running across the slope, which are
interchanged each year, whilst a large part of the common grazing lands are divided into

1. Pre-1939 much of Valtos was cultivated in lazy beds - by spade. Today 9% is cultivated by spade; 43% by horse plough + 48% by tractor.

632 strips running across the slope, which are interchanged each year, whilst a large part of
434 the common grazing lands are divided into interchangeable sections ("quarters") to
341 accommodate each of the groups of crofts. See Figures 22 and 23.

The cultivable crofland at Kneep is relatively flat and the natural drainage is poorly
developed; the quality of this land, depends to a very great extent on the upkeep of a dyke
312 running across the crofland from a small marshy lach to the sea. This dyke has not been
cleaned for several years, and as a result a large area has been invaded by reeds. Other
parts of the crofland have been similarly overrun by 'wild rhubarb'. Such deterioration is
almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the
edge of the machair have probably never been occupied since the crofts were allotted in
1911 and are now used only for grazing. The main body of the crofts, nos. 4 - 13 lies
south - they are more compact than those in Valtos and Reef, but they vary in size from
2.9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 15)
are separated from the main parts of Reef: they are both small (2.5 acres) but the size
is compensated by their situation on the level terrain of the machair. The old farm house
is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the
241 machair crofts, is on lazy beds - but many of these have decayed with the advent of horse
407 and tractor ploughing; 35% of the land is cultivated by spade, and the remainder by horse
plough.

433 The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen
crofts are occupied and of these five are worked by disabled crofters or crofters over
320 sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today
apart from the disabled, the majority may be taken straight to Ohan where up to twice the
local price may be obtained. The C.S.A. pay 2s less per lb than Ohan because of the
cost of the carriage of the peat, and the wages for two men with their boat. There was an
experiment in flying lobsters direct from Lewis to Billingsgate, but the cost was too high.
The problems of transport here are very severe for the lobsters have to be sent by
Macrayne's steamer and by British Railways upon which there are no cold wagons reserved for the small quantities in question - a hazardous course for a highly perishable cargo.

Conclusions.

This part of Uig, therefore, has had a long and complex history of human settlement,
exploitation and depopulation. Much of the more recent part of this history is vividly
remembered and still plays a part in the making of modern decisions. The sense of kin-
ship with the past is an important element of society, for where natural resources
are so limited a mystique of other than a material type is necessary if society is to retain
182 its self-respect. However, the scarcity of natural resources is indeed so limited that economic
131 self-improvement is extremely difficult. The egalitarian tendencies of Gaelic society and
20 the absence of chiefs are not sufficient to resist the tendencies of the times and to pre-
vent some of the crofters making adjustments in their holdings, but unfortunately there is
not sufficient capital to allow such adjustment without a drastic reduction of population
which would be equally damaging to the well-being of the local society. It seems unlikely
that alternative sources of employment could easily be found - the isolation within Lewis,
the isolation from markets of Lewis itself, and the lack of local resources have combined
on previous occasions to defeat plans for development. Weaving is the most important
means of supplementary livelihood, but it is too vulnerable to politics and fashion; fishing
228 is greatly decayed from its former dominating position; only agriculture remains locally,
and perhaps the greatest possibilities there lie in better standards of cultivation (especially
drainage and fertilization), a better standard of animal husbandry, and more reseeding.
But whatever developments are undertaken will need careful selection and encouragement:
results cannot be hurried but nevertheless something must be done soon if the local society
is to maintain itself. This great and paradoxical element of the "crofting problem" is so
important here as elsewhere in the seven "Crofting Counties".

Unlike the
smallhand farmer, should an islander withdraw his store
432 stock from the autumn sale he cannot easily present it elsewhere a few weeks later; he
must keep it from the autumn until the spring, which will probably involve him in buying
feeding stuffs out of his seriously depleted income. Many crofters suspect that their
difficult position in this respect is taken advantage of by mainland buyers. Whether
this is true or not the result is the same - the crofter is discouraged from raising stock.

433 Many crofters with whom we discussed this problem realised that, by fully stocking
and cultivating their crofts they might double, or even treble, their income from
agriculture. Some realised that sound management of a large unit, such as the
amalgamation of two or more crofts, or the hiring of a neighbour's machine, might yield a reasonable
family livelihood. What they all stressed was the uncertainty - the uncertainty of stock
and weather, the uncertainty of subsidies from year to year, the uncertainty of the future
of their little packs of sheep and the uncertain effects of the weather on their hay and
oats harvest. It is clear that the crofter may be conservative in his attitude to
agricultural operations and in their own technical ability. Therefore they prefer to take
a sure weekly income, however small, and to work their land at a low level of
productivity.

000 Climate, soil, and insularity (to which must be added the particular isolation of south
Uig and Bernera, even within Lewis) all present problems. But there is a tendency to
overstress these difficulties and to use them as excuses, whilst failing to appreciate that
433 they also offer certain opportunities. Many agricultural raw materials have to bear the
cost of shipping from Glasgow or from London, but not from Leith; the peculiar difficulties of land stock
marketing have already been mentioned; but, equally, the Minch could and should
provide a great protection for island agriculture. Elsewhere in the Highlands and
Islands, potatoes and vegetables, imported daily into Stornoway from the mainland,
are a standing reproach to crofting agriculture. Crofters could produce most of this
food and if they would they would be turning to advantage the disadvantage of insularity.
Some will admit this; if pressed, but they will also rightly point out the difficulties.
These are two-fold: technical (particularly in the case of legal restrictions on milk
production for sale) and economic (the difficulties, or believed difficulties, of marketing).
A few individuals, for example, claimed that it was not worth selling potatoes unless
they received the full shop price; this is a stubborn and stupid attitude; and one is
reminded of the crofters' long opposition to the introduction of the potato, nearly 200
years ago; a co-operative marketing organisation might help in this respect.

The crofters' attitude to innovation is all-important; new ideas, whether in
agricultural practices or in marketing, require careful introduction and a good deal of
fostering. The crofters' lack of confidence is a real factor and must be taken account
829 of; it is not due only to the risk and uncertainty of markets, they also lack technical
knowledge, even though they may have plenty of ability. Again, the prevalence of
small units means that it is particularly difficult to adopt innovations, a failure which might be
negligible on a large farm can become a disaster on a croft. The crofter has not the
resources of a large farm. However, the smallholder is indeed so limited that economic
169 methods or crops on other farms because he lives and works in a restricted environment.
Agricultural colleges are not sufficiently in touch with the problems of the times and to prev-
ent some of the crofters making adjustments in their holdings, but unfortunately there is
not sufficient capital to allow such adjustment without a drastic reduction of population
which would be equally damaging to the well-being of the local society. It seems unlikely
that alternative sources of employment could easily be found - the isolation within Lewis,
the isolation from markets of Lewis itself, and the lack of local resources have combined
on previous occasions to defeat plans for development. Weaving is the most important
means of supplementary livelihood, but it is too vulnerable to politics and fashion; fishing
228 is greatly decayed from its former dominating position; only agriculture remains locally,
and perhaps the greatest possibilities there lie in better standards of cultivation (especially
drainage and fertilization), a better standard of animal husbandry, and more reseeding.
But whatever developments are undertaken will need careful selection and encouragement:
results cannot be hurried but nevertheless something must be done soon if the local society
is to maintain itself. This great and paradoxical element of the "crofting problem" is so
important here as elsewhere in the seven "Crofting Counties".

CHAPTER FOURTEEN

CONCLUSIONS

H. A. Moisley

121 The relationships between Place, Folk and Work are seldom simple; in a crofting community such as Uig they are particularly complex. The object of our survey was to make an impartial, factual record of the physical and human resources and their utilisation, as described in the Preface (Part I, page 1). The primary purpose of this report is to make our observations available to others and to this end we have included a great deal of fact leavened, we hope, by a modicum of personal impression. In conclusion, however, it seems appropriate to add certain personal conclusions based on the detailed observations and data relating to the crofts and townships visited.

The outstanding fact is that, over the whole parish more than a quarter of the population between the ages of 15 and 64 has to leave home in order to make a living. Of those who remain at home, 80% of the men are more or less engaged in agriculture; almost all of these have some other source of income, usually weaving, and in most cases the cash income from agriculture must be less than £100. Although we classified some 60% of resident males as 'crofters with regular employment' this must not be taken to be necessarily the same as having a full-time job. The average income of a weaver in South Uig, for example, is only of the order of £250 per annum. Thus crofting with ancillary employment, or employment with ancillary crofting as is more often the case, conceals a good deal of under-employment. Such low incomes and hidden unemployment are characteristic of West European under-developed regions.

The crofting system can never provide an ideal structural system for agriculture, but that is not its real purpose. It is a social system and, whether it is economically efficient or not, it exists. It should not be allowed to decay for that would not only cause hardship to the crofting communities but would also, in the case of islands and other remote districts, lead to the abandonment of potentially productive resources of land and people. Nor should it be preserved unchanged; preservation would mean fossilisation and fossils are dead. The present crofting system was cast in a legislative mould in the late nineteenth-century when population pressed heavily on the resources of the islands. Circumstances have now changed and the mould must be altered or the communities will slowly die.

This is not to say that wholesale reorganisation is required, at least not in Lewis. But the authorities charged with the welfare of the crofting townships, and of the island as a whole, have a duty to see that crofting evolves towards something more, and less, productive. Subsidies alone are a confession of defeat. It is not good enough merely to spend money to alleviate the symptoms of a disease which it is now fashionable to call 'under-development'. Realistic planning is required so that the special public expenditure incurred in such regions becomes a productive investment and not merely a disguised form of charity.

It is encouraging to note that such economic and technical developments as have taken place (particularly the development of weaving and the improvement of common pastures) owe a good deal to local initiative and local investments. This suggests that, given suitable guidance and encouragement, the crofting townships can do much to help themselves. It would be an excellent thing if, in each district, informal and quite unofficial discussion groups could be started to think about the future of their particular townships in terms of development and not decay.

Realistic discussion of development must face certain facts even though in some cases they may be unpalatable or politically unpopular. Amongst the most important are these:

000 1 Further depopulation is inevitable but is not necessarily bad. The special privileges
171 of crofting tenure have tended to delay the inevitable because the agricultural structure
142 has been unable to adapt itself to changing circumstances. The land is in some ways less
371 productive than it was 80 years ago. But, as population does decline, eventually more
433 land might be available for each remaining family and, if properly used, should enable them to increase the proportion of their income derived from agriculture. Thus depopulation could have beneficial effects provided it were not haphazard nor complete. The nation could have benefited if depopulation could be controlled to some extent if a realistic rate and ultimate extent of depopulation could be decided, followed by a vigorous attempt assessment of the possibilities of each district were made, followed by a vigorous attempt to realise these possibilities. This must be done locally because the problems and possibilities of each district, sometimes of each township, are different. How can this be done?

287 2 It is not realistic to plan for any extensive development of industry nor for any substantial further development of forestry or fishing. The only industrial development of any importance - the phenomenal growth of the Harris Tweed industry, with an annual output worth £5 million, much of it for export, is proof enough of this. It is difficult to get industrialists to invest in Scotland and there is little point in living in perpetual hope in Lewis. To constantly cry, as some politicians do, that 'the government has sufficient need industry in Lewis', is not helpful, either; for no government has ever had sufficient power, nor is it desirable that it should have, to force a firm to invest against its will. If there is to be some industrial development it must come from within and be effective to depend on it. If, therefore, that agriculture must be made a more efficient basis, though not the sole basis, of most crofting communities. The present heavy dependence on casual or seasonal employments, and on permanent employment away from home, can never provide the basis for a truly viable community though it may provide a useful outlet for some younger folk. On its present scale it leads to the neglect of the land, as well as encouraging permanent emigration, only widespread natural resources, the land, as well as encouraging permanent emigration.

311 3 Crofting agriculture, as at present carried on, on most crofts, does not make the
433 best use of its local resources. The land is marginal in many respects and the development of an economic form of agriculture requires

(a) particular skill in farm management, including initiative and technical ability to take advantage of local raw materials and methods, and

(b) a marketing system on which the crofter believes he can depend. At present it is the uncertainty, as much as the poverty, of the reward that deters young men from taking up agriculture seriously.

412 4 The small size of holdings need not be a serious disadvantage. Since the time of our survey subsidising is no longer necessarily contrary to the principle of crofting tenure; since it represents a voluntary evolution towards larger holdings it, rather than wholesale reorganisation, should be further encouraged.

5 It should be recognised that if a croft is not properly stocked it cannot justifiably be the subject of any of the privileges of crofting tenure. Failure to maintain a properly balanced stock is damaging to the land and to the ultimate well-being of the community as a whole. At one time the factors, through their ground officers, maintained a degree of control over the stocking of township lands and this could, in some way, be restored - though not by the proprietors then by the Crofters Commission. - though the best way would be voluntarily, through the township committees. This would depend on establishing soumings which fairly represented the grazing capacity of the township land and on restricting the unlimited substitution of sheep for cattle. At present many soumings depend on estimates of old ones the validity of which is very dubious; soumings are unlikely to be respected unless they are reasonable.

181 6 Few crofters possess sufficient technical knowledge and confidence to make the best
181 use of their land. It is particularly difficult for men with such limited resources of land and ready cash to embark on new agricultural enterprises; they are naturally reluctant to take risks and therefore tend to be excessively conservative. This cannot be put right quickly nor so long as the majority of those working the crofts are middle aged or older men who have spent the greater part of their working lives in other occupations. Such men require special help but, above all, some of the younger men must be encouraged to

17 or summer pastures for the tenants of Laxay and Harnish respectively, townships on the north
178 shores of the loch. In 1775, there were four tenants in Kershader, but their place of origin
291 is unknown. In 1805, five tenants are recorded, two of them from Uig, by 1826 there were 10
341 tenants. Thus the growth of population in Lewis during the second half of the eighteenth century
311 may well have been the major reason for the colonisation of one of the least agriculturally
161 attractive districts of the island.

From Figure 1, which shows most of the thirty-four occupied places south of Loch Shiell about 1828, it is evident that colonisation had extended south into the mountainous area. The sections, which commenced in Harris in 1816, may have increased the population relatively there as early as 1660, for many of these families came from Harris. The numerous shielings in South Park speak of a vigorous community; it is possible that South Park was more densely populated than the northern area up till 1800.

162 During the period 1818 to 1842, when the grazier, Donald Stewart, and his brothers had a lease
175 of South Park, most of these settlements were cleared (Fig 2): in addition, between 1838 and
341 1842, Crossbost and sub-tenancies in Shiaderaidh, Cleitar, Sgrogarstaigh, Orinsay,
311 Stornoabagh and Iegios were removed, in all about 436 people.[1] Some 27 families were sent to Crossbost and sub-tenancies in Shiaderaidh, Cleitar, Sgrogarstaigh, Orinsay, Stornoabagh and Iegios were removed, in all about 436 people. Many of these families were sent to Crossbost and sub-tenancies in Shiaderaidh, Cleitar, Sgrogarstaigh, Orinsay, Stornoabagh and Iegios were removed, in all about 436 people. Some 27

[Cromore]

The crofters sowed clover with their oats in 1957; the quality of most of the natural grass could be improved considerably by extending this practice. Several of the crofters have taken advantage of the facilities for obtaining lime and fertilisers, but seaweed and byre manure are widely used. Only seven crofts have vegetable plots this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced crops of lettuce, cabbage, turnips and carrots.

The souming for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not enforced. The crofters keep the stock which they can manage to maintain throughout the winter and no one appeared to be dissatisfied with this arrangement. In fact the souming is exceeded by only seven crofters and the total stock for the township is only 75 per cent of the soum. Lambing takes place in April and May and often a high proportion of ewes and lambs is lost. The sheep are clipped in July and each crofter usually clips his own sheep. He either sells the fleece or has it spun in Stornoway before weaving it himself. The lambs are taken from the ewes during the second week of August and then dipped; November is the tupping period and almost every crofter had his own ram. Most crofts have a cow and a calf and the crofters like the calves to be born in March so that they are six months old in October for the Garyvard sales. The cows are served by an Aberdeen-Angus bull from Crobeg Farm. The township gates are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on fank days.

Shielings, situated on the common grazing between Calbost and Cromore, were used until the 1890's. Active land use has gradually declined; in the 1920's, much of the outrun was under cultivation and from an an air photograph, it is evident that hay was being taken on the strips above Cromore in 1946. The present trend is a continuing decrease in the amount of arable land but this year ten crofters formed a group to enclose and improve a ten-acre plot on the common grazing; it is unfortunate that all crofters are not willing to take part. Peats are now being cut near the road between Caversta and Gravir, about three miles south-south-east of Cromore and one mile north of Gravir.

Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore fishermen work on other boats (one from Marivig and one from Stornoway) and there are a few men who would welcome the opportunity to start fishing again. There seem little prospect of this, however. The landing-stage, completed in 1957, is regarded by many as a 'white elephant' and, in fact, at low tide it is useless. So much for the hopes that it might have been used by cargo vessels bringing goods to Park.

In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained by road from two mills in Stornoway and one in Airidhbruach. At present the average production is only one tweed per loom per week but the weavers could quite easily double their production. During the past two years this industry has been comparatively prosperous. Knitting is a winter pastime but only for pleasure, although one household possesses a knitting machine.

In common with the rest of Park, Cromore has a high proportion of old people. Many from the middle age groups have sought employment on the mainland, and the teenagers, many of whom have been at school in Stornoway, seek jobs there or on the mainland, returning for holidays and assisting with the croft work. Some younger folk are resident to care of aged parents.

Cromore is only eight miles by sea from Stornoway yet all communications with the town are by road - a distance of thirty-two miles. There is a daily bus service and the sub-postmaster has a van which is occasionally hired. Some people recalled that the only route to Stornoway was once by boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the haulage in Cromore, particularly for bringing home peats during the summer. As a result of recent additions to the roads, only three crofts remain inaccessible to vehicular traffic. There are no shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday;

means are not infrequently thwarted by the peasants, the ends are seldom achieved.

As long ago as 1859 Norway began a redistribution of the land; by 1946 42 percent of the infield and 9 percent of the outfield had been regrouped. In Ireland attempts at consolidation date back to 1870. Because the problem was especially intricate, some holdings consisted of twenty or thirty scattered patches, the attempted approach has been comprehensive, including assistance for migration, improvements, and the purchase of farms. Today, even where the consolidated holdings are substandard, they are more productive. I do not mean to imply that the program has been uniformly and sweepingly effective. The study by Arensberg and Kimball is ample evidence to the contrary,[14] but there has been reform. Germany, too, has had an all-inclusive policy since the 1870's. There, whole villages must be replanned. Wherever possible, small holdings have been abolished by moving certain families out to new farmsteads and removing others from the land. It is significant that most of the reform took place under Hitler and, even so, there was universal peasant resistance to land reformation. What effect the partition of Germany has had on these rural villages I do not know. Many of those I visited have twice the population of prewar days. In each country, from Sweden to Italy and from France to Greece, the experiments have resulted in increased agricultural production. On Skye, as in most of the Highlands, the tillage area has fallen at a faster rate than the population. Indeed,

[14] Arensberg and Kimball, Family and Community in Ireland.

where the population has suffered the greatest decline and, therefore, where enlargements, by legal or illegal means, have been the most extensive, crop production has declined the most. Nor has the decline in population, accompanied by land redistribution, altered the fundamental problem.

The cottars (subtenants) have almost disappeared thereby easing the excessive pressure on the land and removing the threat of recurring destitution. Today they are found only in a few scattered dwellings and isolated clusters. Most of them have secured some form of employment or have reached the age when a government pension is sufficient to satisfy their needs. The number of crofters, on the other hand, has increased. If the figures 2043 and 1227 can be accepted as nearly correct for the respective numbers of crofters and cottars in 1886,[15] they have increased at the expense of the latter and, also, the sheep farmer, whom they have replaced.

To briefly summarize the foregoing discussion of the township, let us look at Kilmuir. Table 3 shows the number of crofts and crofters in each of the nine townships together with the acreage and "souming" rights available to each individual. Although replanning during the past fifty years has benefited many of the local residents, crowding upon the land is still apparent.

[15] L. MacDonald, The Past and Present Position of the Skye Crofters, sheets 6, 17.

the economy by subjecting many fertile acres to disuse because of his infirmity. The other factor is the absentee tenant, an individual who has obtained possession of a croft, normally by inheritance, but who has failed to take up his inalienable rights of tenancy. Let us very briefly review the economic trends of the last fifty odd years and, then, try to assess the importance of the absent and the aged.

Although the Sgiathanach has refused to become a specialist, fully involved in a money economy, he has become increasingly dependent on the products of the wider commercial society. Long ago he gave up growing the old staples, barley and oats. Not for many years has he grown enough potatoes or turnips to feed himself and his cattle. In place of these home grown subsistence crops, he now imports a great deal of his food. In an average year Skye imports over 700 tons of bread, 10 tons of vegetables, 300 tons of canned goods, 300 tons of potatoes, 500 tons of flour, and 100 tons of milk. To pay for these products, he exports cattle, once his only marketable produce, and an ever increasing number of sheep.

Hance, writing about the Outer Hebrides, sees the growing tendency of the crofters to buy their food as indicative of an increasing cash income.[16] To a certain extent, this may be true. There are, however, additional factors involved. Ecological limitations have played their role. That the climate and soil together make Skye a grassland suitable for stock breeding rather than an island fit for cultivation is an often repeated

[16] Hance, The Outer Hebrides in Relation to Highland Depopulation, p. 22.

887 arduous is difficult to determine. In the winter of 1953, I
241 helped a small crofter thrash oats, a cooperative enterprise
[23] even with a mechanical thrasher, supplied by the Department of Agriculture. The neighbors who came over to lend a hand were two men and three women. The youngest woman would never see fifty again; her seniors were seventy-seven and seventy-eight. The youngest man, who had just been married, was sixty-three; the other seventy-three. These crofters not only showed more endurance than I did, but put me to shame by carrying the sacks of grain from the field to the byre
[162] at the end of the day. Nevertheless, most of those over seventy, about 15 percent of the population, do not make use
887 of the land for more than growing a few potatoes. An old
231 man cannot keep a cow because, as one man said, "You can't
462 have a cow unless you have a woman to milk it." If he is married or lives with a sister, there may be a cow and a couple of sheep. An old woman may have her cow and sheep if she is strong enough. There comes a time, however, when all the old people will only remember the work involved. Still, they will say, "Och, but they were good for all that."

427 Absentee tenants are responsible for depopulation on
241 the one hand and falling production on the other. A reasonable
161 [133] estimate would be 300. Their number could be as high as 400. Some townships have over 50 percent of the crofters absentee. The only townships which do not have this problem are the few which contain large crofts. On one small estate there are seventy-six crofts, held by seventy-two crofters. Only thirty

228 Throughout the present century, the commercial importance
162 of fishing, judged on the basis of income, numbers of crofter-fishermen, and boats, has steadily declined. The number of crofter-fishermen has decreased at a faster rate than the decline in population. In recent years its significance as a part-time chore has also been reduced. Wage labor has replaced fishing in the economic pattern. In 1900 there were 1,015 crofter-fishermen with 485 boats.[22] While the number of fishermen rose to 1,039 in 1905, from then until now their number has fallen steadily. In 1953 there were 237 crofter-fisher-
228 men with 120 boats. Despite higher prices, the value of fish
[433] landed on the island is one-third that of 1900. In 1952 the total contribution of fishing to the local economy was £10,091. This is in marked contrast to the Outer Hebrides where fishing
[242] brings in more money than crofting.[23] Fish have, of course, remained essential in the diet. All the crofters have their barrel of salt herring, purchased from mainland curers. Their own fish is usually sold for fish meal.

All who have considered the "Highland Problem" have stressed the need for some form of secondary employment to support the economy. Fishing has enjoyed great popularity as a recommended industry. This is due to the long tradition and the importance of fishing in the Outer Isles.[24] There are several pitfalls in the program as far as Skye is concerned.

of tenure function to protect the individual from potential 178
abuses by a landlord where customary usages once fulfilled the 182
need. Moreover, even though the tenure of the cultivated soil 423
grants all the rights of a landholder, including the rights 427
to bequeath the house and land to a member of one's family, 657
for more than half the year it is used communally.

The Sgiathanach has never adjusted sufficiently to become 178
a specialist, not even a specialized grazier. For him the 423
land has always had a more fundamental value than merely being a means of livelihood. It is the ancestral home. There is a sentimental attachment to the land which is an expression of the affectionate bonds of kinship. The people have never lost the tribal tie of the land and the group. Although the former patriarchs disclaimed any sympathy with this point of view, the landlords on Skye today have kept what little land they have only because of its sentimental value. Indeed the atti-[654] tude of the largest landholder, the government of Scotland, is that the crofting tradition is worth while preserving, if for no other reason, because in the predominantly urban and industrial civilization it has a romantic value. There are other reasons. The Islands have long been looked upon as a [702] human reservoir for the armed forces, and, more recently, for [469] Lowland industry.

As a result of their partial adjustment to the higher 178
socio-cultural level, there have been changes in crops and stock. 231
The British market has influenced the crofters' output, within 241
ecological limitations. The old subsistence crops of oats and 433

barley have been replaced by grass and hay. Conceivably, this 178
is a more complete adjustment to the environment, which has been 231
made possible by integration with a commercial economy, than 241
an adjustment to the demands of the outside world. Whereas 433
the objective of the local economy once was the export of cattle, today the purpose is the breeding of cattle and sheep for the national markets. We have seen that there are a host 182
of limitations and difficulties in the economic aspect of the 231
culture. Many of these are due to the persistence of con- 241
servative practices. Each crofter must keep pace with his 433
tradition-practicing neighbors, with the old men of the town- [628]
ship. Others are the result of an inhospitable environment. The economy does not run smoothly, but this is not conclusive evidence for disorganization. Integration does not mean smooth functioning. In the spring and autumn the crofter is confronted with a variety and succession of tasks which would fill a specialist with dismay. Very often, these pastoral and agricultural chores have to be carried on in conjunction with outside employment. In return for his labor, the crofter [434] receives a meager income, frequently supplemented by con- [657] tributions from his children or the government. As a further [167] result of the partial adjustment to the wider society and culture, the people leave the island to seek employment and to achieve an upward mobility impossible on Skye. Economically, [175] Skye, along with most of the Highlands, may be viewed as presenting a picture of the Lowlands of Scotland 200 years ago. That is the extent of the economic adaptation of the Sgiathanach to the national culture.

434

On one of the crofts along the strand are the ruins of two curing houses, where the fish were salted and dried; ling, cod, skate and halibut were cured and sold to local merchants for export. "The same as they do in Iceland this very day. That was the main industry. Then the English came with their steam trawlers; they ruined the fishing here, and then went to Iceland and the Faroes. In Iceland they get fined for poaching, but here the trawlers often ignore the three-mile limit. But the fishing was the mainstay here, before the Harris Tweed came along."

One man returned from selling in 1938 and bought a boat for £24. He had 32 lobster pots, and made £7 one June by selling the lobsters at a shilling apiece. Another man, who returned from the United States in 1934 because of the depression, bought a share in a 14-foot boat. It was made in Stornoway, but was known up of Lewis, and cost about £14. He and his partners went out every night possible; the fish provided an important part of their income. The boat was sold in the 50's. "It wasn't being kept up anyway." Around World War II there were as many as twenty boats; man fished at night, after a day's work. Today there are four 12-foot boats in Shawbost, each shared by four or five men. The boats are used intensively for fishing during certain times of the year,

but not as often as in the past. In the past boats were in danger of being smashed by the strong seas that winds and gales made; many access to the Shawbost harbour; but today, because so many cars are available, the boats can be sheltered in the more protected bays of Carloway, five miles up the coast to the southwest of Shawbost. Despite this protection and the increase in income since World War II which would enable more people to buy boats, the number of boats remains small.

In the past certain people were esteemed for "knowing the wind and the sea." The sound of the surf coming from different directions presaged different kinds of weather; a line of white across the bay meant bad weather in a few days. A fifty-year-old man says, "My father and grandfather could tell when a storm was coming. They needed no barometer, and they didn't have radio and television to tell them. I would know the signs, too, if I had listened to them."

Not only was there local fishing, but the men used to hire themselves as crew on other fishing boats. Several nicknames reflect this history. One family is known by the nickname "Strachan," the surname of a man who lived on the east coast of Scotland and on whose boat the head of the Shawbost family had once worked as

a crew member. Another family is called "cook," the first job which a novice had to assume when he joined the crew of a fishing boat. One of the last men to go to the east-coast fishing is about 60 now. The men came back from the fishing in time to bring in the oats, barley and potatoes, and the money was used for rent and the purchase of various foodstuffs and other goods. They usually brought enough rolls of wallpaper to cover the stone-walled or wood-lined high dubh (black house) for another year. Twenty pounds were good wages for a season. While the men were away at the fishing, the remaining members of the family lived on credit from the local shops, and depended on the good will of their neighbors.

Many men joined the armed services, and were especially sought after by the Navy and the Merchant Marine. In 1900, there were 2,500 Lewismen in the Naval Reserve.

Around the turn of the century, until the first world war and the growth of the weaving industry, the girls used to "follow the fishing." "Everyone came to know by the nickname "Strachan," the surname of a man who lived on the east coast of Scotland and on whose boat the head of the Shawbost family had once worked as

People kept several cattle, some of which were dry most of the time. But because everyone was keeping cattle, milk could be gotten from a neighbor. One man was known as a man who had spent some hundredweights of potatoes before the war, some of which would be used to feed the livestock. "You couldn't buy milk then, so you had to keep a cow. And even though people were weaving, they weren't getting so much money as they are now. It was the barter system then for the most part. Or they didn't have the money to buy feeding stuff. It was better to spend the time planting potatoes. Now of course there's more money in the weaving."

Milk was for what we ate, an oat was passed which provided free milk for schoolchildren. Milk for the Shawbost school was supplied by a farm near Stornoway, and villagers first started buying the milk from the school milk van. A strike held by weavers during the war had increased the payments for weaving, and the barter system had stopped. Much more money was available. As the loom was more profitable, more people stopped keeping cows, and relied on their neighbors for milk, or got their milk from the van bringing milk to the school. And as the cattle got fewer, the market for bottled milk expanded. A dairy was started on the west side of the island in the mid-1960's which carries milk from Uig to Ness.

drying the wool it was spread out, dried and sent to Stornoway to be made into yarn. The yarn was then sent back, and the weaver wove and washed it. About six women were required to do the washing (the process by which the cloth was washed and shrunk).

"In those days the weavers designed their own patterns, and sold their own finished tweeds. I remember going into town with my brother, we had two tweeds in the cart. We went into a shop to sell the tweed, and the man said it was poor weaving. He didn't want to pay the full price for it. I told my brother to roll it back up, we would take it somewhere else. As we left the shop, he told me I had 'good cheek.' In the next shop the merchant didn't say anything, and my brother the regular price. We went home with £60."

The great demand for tweed encouraged the development of more efficient methods of production. One by one the various processes of production were taken over by specialists, and gradually these specialists were brought together under one roof. Large boilers for dyeing wool were supplied as a result of actions taken by the Congested Districts Board, which was formed in 1897. The Scottish Home Industries provided chemical dyes. The most difficult and time-consuming processes were carding and spinning, which small mills on the mainland began to do

at work producing tweeds which it then tries to market. The latter method requires the investment of a great deal of capital to make the tweeds and pay the weavers before a buyer is found. The small mills require an immediate return for their small investments, which is ensured by not investing unless there is a definite order. The fortunes of the weavers oscillate with the luck and skill of the mills in soliciting orders; thus, the mills do not provide a steady, stable source of income. The nature of the tweed, as a high-priced luxury item rather than a basic necessity, contributes to the instability of the demand. When fashions change or when world-wide economic depressions come, the high-priced tweed with elaborate raised lines as a cloth for aristocratic sporty dress is forgotten for awhile. Efforts are being made to change this image; but the product's status as a high-priced luxury item persists.

An extremely small business can survive periods of depression when capital outlay in the form of machinery, running costs, and so on is not large. An extremely large business that has cornered a large share of the market can often survive an erratic schedule of orders because it has a larger accumulation of capital, but a medium-sized business has too much overhead to survive long periods of depression. Examples of all three exist

through alleys to rummage through the trash cans of hospitals or other large institutions for food. The occupational histories of the weavers support the generalization made by an official of the Harris Tweed Association that the younger weavers leave because they do not like the weaving and they are replaced mainly by older men who want to settle down after a life at sea. (See Appendix A for several life histories of weavers.)

E. Crofting as Strategy

Because of the relatively high income provided by the Harris Tweed industry, those who remain within the township have tended to emphasize weaving and neglect the croft.

1. Croft as Place of Residence vs. Agricultural Unit:

Most of the 160 households consist of married couples with their unmarried children. A tendency to marry rather late in life and for children not to marry while their parents are still living is evident in Table VI. (Partial List of Households According to Type of Household and Age of Household Head).

Four-teen households of married couples and their children (not included in Table VI) include at least one 1. (This source as reported his household in this table--also just

One crofter who gets subsidies says that he keeps sheep and plough the land to feed them only as a "hobby." He uses the word "hobby" because, in comparison with the income he gets from working regularly in the mill, he does not get a good return for his investment.

A crofter who has been weaving all his life says that the income he receives from his cattle and sheep does not compare with the income he receives from weaving. Subsidies are counted as an important part of the income he receives for the livestock. "Last year I got £28 for a heifer--not a very good price, but then I got as ill mainly as well." He does not believe that anyone could make a living from crofting alone. "You say some of the people in Stornoway are able to make a living at it? They might be getting social security as well, they're that sly. Anyway, members of the family are probably sending money home from sea or from the mainland. You need a weekly wage. If the tweeds disappear, the only thing a man could do would be to go to sea." (See Appendix C for an example of the balance sheet of a croft.)

A few families were seriously at rearing cattle for sale in local or town markets. These are usually composed of several male adults, of which one or more work in the mill or do weaving and someone is largely responsible for croft work. Most of these people look

One of his
[illegible] opinion was his sister's son, who built another house not far away. "This was the center of gossip. People gathered there while he shoed horses that came from Barvas to Carloway."

A number of shops were established in Shawbost that sold clothing, cooking ware and groceries. At one time they numbered six altogether. These shops also ran the first buses between the village and Stornoway. Gradually these businesses disappeared because of competition with larger companies. Mobile grocery vans and butcher shops and bakers began coming in the late 50's, and gradually took over the trade in large parts of the island, undercutting the local businesses. Income from weaving had already weakened drastically, however, as the intensive use of land and sea and also weakened the formerly heavy reliance on local lies and mutual aid. Today an army of town-dwelling entrepreneurs and employees constitute a major proportion of the traffic on the island roads. Crofters, fish dealers, bakers, sellers of soft drinks, garbage collectors, insurance salesmen, mobile banks, coal dealers and others extend goods and services from centralized sources to a market which has money to pay for them. The island's participation in this extensive market system is affected by its marginality to the

288 The Harris Tweed industry has provided a higher
434 standard of living, but income from this source is
inconsistent. The standards developed during prosperous
times cannot be met during difficult times. Many-roomed
342 houses with indoor plumbing are more heavily taxed than
336 smaller, less modern homes; loans must be repayed;
651 a car and a television once gotten are difficult to
425 give up. A weaver must pay for his insurance stamp,
945 which amounts to over £70 a year; and income tax takes
651 a large percentage of a person's income, in large lump
sums which are paid twice a year rather than in small
amounts throughout the year. When income fluctuates,
any constant demand for monetary outlay constitutes a
liability.

454 To many persons outside the island concerned with
181 Highland and Island development, Lewis has a reputation
for "subsidy-grabbing." According to one official,
"The people are too used to getting subsidies. They
tend to sit back and rely on the subsidies, which
makes it difficult to develop the place."

827 "We pay tax," said one weaver. "Why not get back
what we can in subsidy?"

Income tax collectors shake their heads in despair
651 at the thought of trying to get a true estimate of a
934 crofter's income, except for jobs such as weaving for

651 which official records are kept by the mills. If you
434 say jokingly to a fisherman who has brought in a large
catch that he should put some money aside for the
income tax man, he is likely to reply, "He'll have to
463 catch me first." A tradesman may be earning large sums
434 of money doing local work as a skilled specialist at
745 the same time that he is collecting social security.

A man may move in and out of a number of different jobs,
and never report his income. "Occupational pluralism"
171 (cf. Brox 1968) rather than economic specialization has
developed as a strategy in various countries along the
North Atlantic fringe, such as Iceland, the Faroes,
northern Norway and Newfoundland, as well as the west
coast and islands of Scotland. In these marginal areas,
income from specialized occupations is, in the long run,
unpredictable and inconsistent.

108 In times of national economic depression, strikes,
468 shifts between socialist and conservative governments,
241 and other crises, crofting provides an alternative
196 strategy. During the last war, many islanders who had
792 left the island (including some who had been quite
166 prosperous in the cities) returned to spend the duration
of the war in the village, glad of the relative security
provided by the relative abundance of food and less strict
000 rationing. During a huge snow-fall that occurred on

175 During a huge snow-fall that occurred on
262 Lewis in the 1950's, the mobile grocery vans and other
132 supply vehicles could not come out to the west side,
443 and a group of men had to make an expedition into town
for provisions, after which many families made certain
that they always had a good supply of meal, salted
mackerel and herring. Many villagers have gotten deep
464 freezers to store beef and mutton; others say they do
345 not trust the freezers, that a failure in electricity—
which occasionally happens in this region of gales and
far-away repairmen—would bring disaster if they depended
fully on them for keeping their meat. When the tweed
458 industry is going through one of its periodic depressions,
226 more men go out more often to fish. "I've been going
out every night for the last week or so. I don't have
a tweed, and I won't have one for the next six weeks.
I don't know what I'm going to do; maybe I'll go back to
sea. Three of us caught one hundred mackerel last
251 night. I salted my share, and didn't give any of them
away. These are the hard times. We're going to need
them during the next six weeks."

A few people raise beef cattle, depending largely
233 on subsidies for encouragement to do so. A few are
654 beginning to keep cows again for milk, giving as their
824 reasons that freight charges make the bottled milk too
425
143
348

233 costly, that the Common Market will soon drive up milk
654 prices, and that income from the weaving has become too
824 uncertain.
425

Many tools and techniques associated with crofting
412 have disappeared: the flail for threshing oats (two
178 pieces of wood joined with leather); the sheepskin
stretched over wood with holes burned into it, to separate
chaff and grain; rope made of plaited heather and straw.

231 Each spring the byre was cleaned of its accumulated dung
654 and urine, and this was turned into the ground along
824 with seaweed. Such tools and techniques remain among
173 the older villagers as a "memory culture" which may be
367 mobilized under changed conditions, as when alternatives
to crofting are no longer available or are too costly.
However, the longer crofting is neglected, the less it
will provide an alternative strategy. "The artificial
241 fertilizers are ruining the land; that's why the
824 turnips are full of maggots and the potatoes turn to
233 water." As the rushes grow and clog the drains and
streams—rushes that used to be eaten by the horses and
cattle and which are now left untouched by the sheep—
the land becomes unfit even for grazing. "I'd rather
work the land than the blinkin' loom, but we tried the
potatoes, turnips and cabbage last year, and lost them
all to the maggots. You lose heart after that."

154 genealogies told, and old songs were sung or new ones
654 composed. The concentration of expressiveness in these
824 forms resulted in a well-developed, oral repertoire of
173 literature and music.
367
533

The ceilidh still exists today in the form of less
538 regular gatherings. Stories and genealogies are seldom
533 recited, but songs are still sung. A few new songs are
being composed. The word ceilidh is used as both a noun
231 and a verb to mean "a visit" or "to visit," but implies
654 a casual, relaxed atmosphere rather than a formal visit.
824 A formal visit is made by relatives living in Stornoway,
173 government officials or businessmen, and is characterized
367 by more constrained behavior.

154 The ceilidh of today is often accompanied by the
654 drinking of beer or whiskey, but a distinction may be
824 made between a gathering which includes both males and
173 females, and a drinking situation at which only males are
367 present. In the past, men often gathered in barns or
weaving sheds to share beer made locally from barley or
273 brought from town in a large keg. The drinking of whiskey
178 was reserved for special occasions, such as births, weddings,
434 funerals, and the festivities surrounding the New Year, but
increased income has resulted in the consumption of whiskey
on many other occasions. Heavy drinking is still an
215 activity engaged in largely by males, and occurs in extra-
village locations such as hotels and bothans (see
Chapter 6).

273 a while. It would be an insult not to take a drink with
654 them; you mustn't miss your round."
576

The usual practice when drinking with friends is
273 for one person to buy the drinks; everyone drinks
654 together, and then someone else buys the next round. To
431 drink slowly is to indicate that you intend to miss your
round. A relative who returns to the island for a holiday
usually pays for more rounds than he receives, and may
spend as much as £80 in a single week.

If a man wants more drink than his fellows, he has
several choices. He may step up the pace of drinking by
buying more rounds, which means that he is likely to pay
a larger share than the others during the evening as they
will be ready to quit before he is; or he may keep a bottle
hidden outside the room, and disappear periodically for a
private sip, after which he returns to the group.

273 As incomes have grown, excessive drinking, which was
654 once confined to a small number of occasions, has also
824 increased. In the days when money was scarce, people shared
178 with others what they had. Elaborate and relatively lavish
434 ceremonies in which all community members participated
were possible because of the contribution in labor and goods
of members of the community. The custom prevailing today is
to use the added money not to purchase more goods and services,
to travel, or in other ways that might result in both social

273 differentiation and differentiation in personal experience,
654 but to use it in the community, as social coin. The few
824 men who refuse to get involved in drinking episodes that
178 would deplete their available funds are called "mean"
and "tight-fisted."

"If I had a wish, I'd choose to live the same life all
over again, maybe a wee bit rougher. We don't get a chance
here. The poverty keeps us down. But what does it matter
to be a schoolteacher or a minister? What good does it do
you? If I have a shilling in my pocket, I've got to spend
it. I remember ten years ago, I went into town with £60
in tweed payments to buy a new stove. I met some of my
425 mates, so I put £20 down on a £50 stove and spent the rest.
What a time we had."

"I went for a holiday on the mainland and came back
484 with money in my pocket because it's no use drinking in a
place where you don't know people. You want a yarn."

Drinking occurs at night behind the gray, concrete
273 shield of the bothan or in hotels. Drinking situations
654 provide opportunities, rare in the repressive arena of the
824 village, to express emotions and ideas. These expressions
can always be retracted in the cold, sober light of day.

"I used to be an alcoholic. Now I spend most of my
weekends feeding my brother lager so he won't get the DT's.
When something good happens, I wish like hell I could get

746
161 Death is a common event in a community which has a large
number of old people, and the theme of death appears
repeatedly in sermons and in the conversations of those
who have undergone religious conversion. The temporary
pleasures of drink are contrasted with the eternal joy
781 awaiting those who have been saved. The "false" friend-
784 ships of the drinking situations are contrasted with the
more lasting, consistent relations which characterize the
clique of the converted. "You have lots of friends when
you get converted, and they don't change overnight the
way your drinking companions do."

273 "With the drink it's easy to get started and just not
654 be able to stop drinking, especially with the money there
781 is now. Everything's unsteady here except religion."

Many of the most deeply religious male members of
273 the church were once heavy drinkers. One villager observe
654 "If a man went to extremes as a sinner, he'll be just as
781 fanatical when he becomes holy. Had it not been for
143 religion, some of them would have landed in Craig Dunain
[the mental hospital near Inverness]. The talk is forever
on religion. That keeps their mind at rest."

105 fact that crofting townships are located on marginal
24 land is one reason that the larger society is not motivated
654 to exploit the land. The Crofters Holding Act of 1886
[311] and subsequent legislation ensured protection of and
[671] incentives for continued maintenance of crofting and
the crofting township.

Protective government legislation, grants and loans for housing, subsidies for rearing livestock, relatively low taxes, and the economic protection provided by a socialistic government in times of crisis have helped to maintain a core of crofting families for many generations.

105 The predominance of older persons in the township is
162 striking, but many of the younger people who have left
632 the island to work on the mainland return frequently,
166 contribute part of their salary to the remaining family
434 members, and plan eventually to marry and settle down in
584 the village or to retire there. Long-term residence of
[621] kin-linked families in a small area has in itself contributed to the boundedness of the township network.

105 The policy of the government, through developmental
24 agencies such as the Highlands and Islands Development
654 Board, has been to support economic strategies that
632 complement rather than interfere with the functioning of the crofting township with its small holdings and communal
000 practices. The Harris Tweed industry is lauded as an

241 654 Cultivation for subsistence is minimal, and in
part stems from government-defined privileges and du
288 477 464 regarding maintenance of a croft. The Harris Tweed
industry, which is restricted to the Outer Hebrides
thus is protected from competition, has provided wor
166 [434] for a large number of islanders. Many of the younger
members of croft families live in cities on the main
and send part of their wages home; they return regul
[162] [632] to the island, and many plan to retire there. Thus t
township supplies urban workers who remain very much
attached to the rural townships, which are composed o
511 454 293 aged family members and a rural proletariat. The sta
of living is high, and many crofters have accumulated
savings, although much of this surplus is used by the
for alcoholic drinks.

121 In Britain, rural communities have been interpre
as lying somewhere along a rural-urban continuum (cf.
Southall 1959, Frankenberg 1966). In 1959, Southall
presented "an operational theory of role" by which he
suggested that heterogeneous societies may be analyze
and compared. He developed the concept "density of r
texture" to describe societies which lie along a cont
from rural to urban. Frankenberg (1966) uses Southal
concept along with other concepts to present a more
complete model of an urban-rural continuum. The "mod
of both Southall and Frankenberg are essentially list

quietly triumphant yet unassuming way. He does not kill any of his sheep for home consumption.

His involvement with the croft is a "hobby" because its output does not compare with the income he receives from weaving. Whereas he might make as much as £100 from his crofting activities, his income from weaving averages £600 a year. As a married man, he can earn as much as £4,4 without paying income tax.

Income:

Sheep: 1,27/- (three sheep sold to the slaughterhouse in Stornoway)
1/6 (Wool Board bonus for the three sheep that were sold)
16/10 (Sale of 12 shillings each for 11 gimmerlings and six sheep)
22/10 (Three sheep from the Carloway Cattle Show)
12/6 (Fourteen fleeces locally)
1,90/14 (Fourteen fleeces to the Wool Marketing Board at an average of 1/11 per pound, or about 17/6 per fleece. The Lewis Wool mills pay only 5/5 per pound. He has been sending his fleece to the Board for many years. Many crofters prefer not to bother with the Board, and sell their fleece to the mills. The Board is the only sheep-scheme in Britain where the option, because of the location of the Harris Tweed mills on the island. But of 1970-71, the mills refused to buy fleece.)

Cattle: 12/- (Calf sale)
1/- (Subsidy for the calf)
18/- (Subsidy for the cow)
1,57/10

Total: 4,16/14

Costs: 1,50/- (Fodder used from December to August; a weight bag costing 1/6 is used almost every two weeks. Other costs do not use this much.)
8/- (Salt used for 7/8 sheep)
9/- (Tractor hire)
(Six hundredweights of fertiliser for oats and grass. For a cropping grass of 1/7.10, three hundredweights of fertiliser must be put on each acre of hay.)
1,79/ 8

Income: 1,16/14
Costs: 79/ 8
Profit: 1 86/ 6 (for about 1.2 back for a very 11 he invested)

Net cash income or profit from the croft thus represents 94 to 105 of his gross earnings from weaving. If computed as cash, unrealcated income from the croft in the form of garden vegetables and milk products would raise the croft income by 130 to 140. In those households that consume their own sheep, the croft contributes an even greater amount.

CROFTING CHANGES

The removal of crofters from good to poorer ground was a significant factor in the decline of the crofting community, with the result that self-sufficiency factor becoming smaller and the dependence on imports (when there was money to buy them) increasing. Today, the crofter is of course not self-supporting, his economic being based on fishing and weaving with the produce of the croft yielding an annual average of some £200.

Acreages under certain crops show this trend to dependence on the produce of mainland farmers. In the island in 1911 some 1,675 acres were under potatoes, the present acreage being less than one-third of that. The number of people per acre of potatoes for Scotland as a whole is 22 : 1. In the island it is about 11 : 1, reflecting a heavy domestic consumption. Yet substantial imports of this crop are required to satisfy demand; a relevant point is that the milking cow consumes the potatoes. The barley crop, once so much used in Lewis's former small distilleries, has been reduced to some 10 per cent of what it was in the past fifty years. On the other hand, the acreage of sheat crops, oats, rye and mixed corn, generally fed to cattle, has about doubled. Oats in particular are in favour for cattle feed, but for three of the past five years the oats crop came were not widely used for human food, and oatmeal has for centuries been imported into the region. The turnip acreage has fallen by over one-third in the past fifty years, perhaps the result of the gradual disappearance of the horse, its steady labour and its dung being required to put good heart into the land.

As the crofters' cropping policy has changed over the past half 2.3.1 century, so has their animal husbandry. Animals are a main self-[illegible] ing product, particularly cows and sheep. Horses, of course, have been drastically reduced from their total of 1,672 in 1911, as tractor, lorry and van have taken over their work. And though some cattle are raised, the numbers are now about 60 per cent below those of 1911. At that time the density of cattle per 1,000 acres was bracy (46-60) in the north-east of Lewis, lem (31-45) in the north-west, and still less further south. The present average is around 18 beasts per 1,000 acres. This decline, in particular in the milk-yielding animals, has compelled Lewis to import 1,000 gallons of milk a day from the mainland.

It is sheep which today claim pride of place on the croft, valued

CROFTER INDUSTRIES

6 TRADE AND INDUSTRY

IN the earliest times, the folk of the island of Harris and Lewis [illegible] were self-supporting; all that they needed for life as it was lived in those days was available at near hand; their existence was self-contained, the economy virtually self-sufficient. By and large, the only commodities often imported were salt, iron, and to a certain extent, wood. Rents were paid largely in kind: the produce of agriculture, fishing, and labour. Surplus produce was directed to southern markets to bring in the odd shilling or two for which there was really very little need in the island. But once money became important in the national economy, it was not long before it was required in the island economy too. By 1790, if not well before, two or three open boats set out each year from Lewis to Glasgow, laden with salt beef and dried salt fish. At about this time, too, changes were making their slow appearance in the island way of life and living. Specialists were being required; smiths, tinkers, shipwrights, tetmakers, boatbuilders, weavers, tailors and cobblers. Each of these crafts was a separate occupation, manned in some cases by craftsmen from outside, some combined, either individually or in shares, and also had some rights in the common ground of the township in which he lived.

CROFTER INDUSTRIES

From the pure crofter class there emerged the crofter-craftsmen. In Lochs, for instance, by the turn of the seventeenth century 80 per cent were registered as fishers and netmakers. In the west, in the parish of Barvas, some 70 per cent were also fishers, with kelp-making as a seasonal occupation. In Stornoway parish, where subtenants paid 30s to 60s in rent, with twelve days' service, they selling to their tacksmen at 5d each, earned 20s a month on herring boats, made kelp at 30s a ton, and worked on-roads for 8d per day.

In Harris in 1895, the eight trained male weavers worked for the gentry only. Weaving for the populace was done by the [illegible]

A HARRIS VIGNETTE

has direct or indirect communication with Glasgow, Stornoway and North Uist. In summer a fortnightly bus runs to Stornoway, and once a day a bus makes the round trip of East and West Harris. The township, linear in pattern, east to west, includes [illegible] which cater for a population of about 300 people. Population within reasonable travelling distance; it also has two cafés, a post office, a licensed hotel, a hall for social functions, a mission hall and two churches. The Sir E. Scott School here is the only secondary school in Harris with an academic stream. Much of the working population is employed in the service industries, the professions and the tweed industry. Tarbert was a fishing port of some significance in the past, and is now a reefuelling point for ships.

The absence of organised industry on a large scale, such as [illegible] is a factor which tends to bring nearer to reality the dream of the poor of Harris nations to leave their native soil. There are small pockets of industry, but these are only dabs of easing ointment on the excessive unemployment sore of 27 per cent. The main occupation is of course crofting, the income from it being secondary to that from employing a tweed mill, from concentrate on the production of Harris Tweed, perhaps using the wool from their own sheep, the natural dyes from the lichens which grow on the rocks and from other plants are still used occasionally. Others specialise in knitwear. Recently shell-craft and wood-turning have been added to the traditional crafts, with an eye to the tourist market. Fishing, of course, plays a part in the economy in a small community. The interest of the Scottish Development Department in the Scottish Country Industries Development Trust has been concentrated on the potential in shell-fish processing, and the production and pay. In the wars of the last century many men served in the Highland regiments, the Navy and the Merchant Marine. Even today, the income from this external activity is not insignificant.

EIGHTEENTH-CENTURY ECONOMY

Information and statistics about the economy of the island in the 18 middle of the eighteenth century are to be found in Walker's *Economical History of the Hebrides or Western Islands of Scotland*; his MS is in the British Museum.

ST KILDA

and to show their friends at home, that they had braved the hazardous Atlantic seas to visit St Kilda on the very edge of the world. The tourists were charitable, but the natives felt that the logical evil in its wake. In 1886, Robert Connel wrote: "One cannot be long on the island without discovering the great moral injury that tourists and sentimentalists and tract vachtsmen, with pocketful of money, are working upon a kindly and simple people." It was estimated that the islanders collectively made a profit of 5s from each of the 200 or more tourists who arrived during the short summer.

The new pier of 1898 cost him a community which required money as an exchange commodity because the original native produce was becoming less saleable, hastened the decline of effort to be self-supporting. The numbers of scalskin slaughtered steadily fell; paraffin oil replaced the traditional blaz of the Kildan lamps. The need for daily work, to toll in fellowship with others, was dissipated; the islanders could purchase most of the food they required, provided communications with the mainland were maintained. The population was in any case dwindling.

St Kildans became more aware of 'the other life' available on the mainland of Britain.

Finally, on a misty summer's day in August 1930, at a cost to the nation of little under £30,000, St Kilda was left to its fate, and keeping of the changeless Atlantic. It is now preserved by the National Trust for Scotland as a crumbling monument to a small human tragedy of a land that has been repeated, and will be repeated, in other small communities who cannot argue out the case for their survival in terms of economic viability. The island is now occupied by military personnel in connection with the Hebridean rocket range on South Uist.

St Kildans were described by Dean Monro, in 1549, as 'simple, poor folk, scarce learned in any religion'. In 1698, Martin Martin published *A Late Voyage to St Kilda*. He was there in the company of a minister who had been summoned to the island to denounce a certain false prophet who had risen among the 180 inhabitants (pretending he was an emissary of St John the Baptist). Martin found, as did later visitors, that the island economy and the quality of its life were closely dependent upon its lack

CH. V FAMILY, FARM GROUP AND TOWNSHIP

encouraging them to rest when the men returned was fondly indulged. Much can be learned from the first (or 'old') "Statistical Accounts of the parishes of Scotland drawn up from the communications of the Ministers of the different parishes", circa 1790-96. Of the parish of Stornoway, where by 1790 many men had become crofter-fishers and others were at sea, the Minister wrote, "The women labour at least as hard as the men", even pulverising the ground with heavy hand-rakes (harrows being seldom used), and digging both with crooked and straight spades. 'That the men's debt was repaid in acts of manly service is true. A man would carry wife or sweetheart on his shoulders across a river in spate, whose rushing waters might have swept her away. But in her turn, a woman would wade into the cold sea, her coats high, bearing on her hips husband or son out to his open boat, so that he could start his night of exposure dry-shod and warm. This act of service was noted and illustrated by Burt at Inverness (about 1726), and it was common in the Lews mainland of Britain.

Stornoway parish, giving one year to four parishes, is a guide for the rest. Fishing, with net-making, was a predominant occupation in all parishes by that time, and boat-building was significant too.

What return for their labours did the people get in the past, it will be asked, and what approach to sufficiency in a normal year? For the Island, the most thorough of the five Parish Accounts is that of Harris, with its fascinating retrospective notes (vol. x, p. 368). There the yield of a typical family share, a 'fourth' or 'farthing' land, was computed at "from four to five bolls" (which in Scotland

COMMUNITY FROM FAST TO PRESENT PT. I

usually corresponded to six imperial bushels). The stock was "four milch cows, three to perhaps four horses, and twelve sheep on the commons as the tenant has luck to rear". Although such estimates, reputedly accurate, are apt to err on the favourable side, a comparison with the same writer's statistics of stock (and rental) shows that this estimate gives only a little over the modern average per family in Harris, and allows an average sheep flock of one score ewes.

The briefer Statistical Accounts of Lewis indicate the average stock per family, suggesting comparisons both with the present, and with an earlier time (Chapter II). In 1790 the cattle and horses, three to four per family, were shared per family than now. In Lewis there were eight head of cattle per family, compared to 2·5 today; there were one or two ponies per family (according to the topography and ploughland of the parish) instead of an average of only one horse to five or six families today; the small family sheep-stock was similarly, and there were also some goats, say, one to every second family. In addition to these resources, there was fishing; and the number of boats in

What return for their labours did the people get in the past, it will be asked, and what approach to sufficiency in a normal year? For the Island, the most thorough of the five Parish Accounts is that of Harris, with its fascinating retrospective notes (vol. x, p. 368). There the yield of a typical family share, a ' fourth ' or ' farthing ' land, was computed at " from four to five bolls " (which in Scotland

175 natural areas, could not be attempted. In any case, the re-
175 clamation of clay land tended to slacken as efforts turned
453 to fishing and kelp-making. The introduction or increased
175 growing of potatoes added to the diet, but hardly to the
310 animal, food supply. Finally, while the beginnings of
310 medical knowledge and vaccination added the growth
175 of population after 1750, veterinary science had made no
175 progress, nor did it advance in the Island for many years
175 to come. We may conclude that as energy stuck per Island
472 family about 1750 was rather more than that of 1750, and
the acreage relatively larger, while both were greater than
the average of today, particularly in the Lews.

175 What, then, could a family have to eat, from such crops
175 and stock? While in winter one ate porridge, it meant no
175 milk to be had on a croft, and there would be little then,
294 there was salt meat, dried or salted cod (or herring) and
fish oil; oat and barley meal and some rye meal; cabbages;
and, increasingly in the eighteenth century, potatoes.
Martin included potatoes among the crops seen even on
St. Kilda in 1697. A century later it was written that
the people of Uig, for instance, had, though "unwilling"
been induced to grow and eat them "forty years before",
and the years tend to be under-estimated where changes
are slow and memories long. But it was written of Harris
that by June the meal and potatoes had mostly been con-
sumed, "and such as cannot afford to purchase imported
meal subsist chiefly on the milk of their cows and sheep,
with what fish they may chance to catch, till their wants
are relieved by the first fruits of their potato crops early
in Harvest".

We conclude that with even less money but a little
more grain the population in the Island had fluctuated
about a mean for some centuries before, as it had in so

176 But the seventeenth century there was introduced
176 the making of sea-weed, or "kelp", for alkali in
176 addition to the ancient drink of home-brewed beer or ale
176 (Gaeilg. a pleasant beverage) introduced by the Excise. In
176 order to pay the rent, the making of whisky from home-
176 grown barley was now a much more a precious foodstuff.
176 The small bulk of whisky facilitated report by tacksman
or Factor, and it also served to tickle the palate, cure the
454 ills and cheer the spirits of northern chieftains. What
175 before 1800 'the Gauger' was in the land, though there
175 was undoubtedly much whisky stills that escaped his eye. In
some of the old houses a hollow space was left at a selected
spot between the inner and the outer walls, to conceal what
175 was to be seen. It appears that Lewis drinkers survive of
the eighteenth century. It is told of a man of exceptional
prosperity, that when he had died an ex pilline "he
could bear on the one side the clacking of his corn mill and
on the other the bubble of his still". What more could
454 he ask for? Kelp was a very dangerous enterprise, and
175 ion as a legitimate home industry by which to pay the rent
678 (in kind or by sale), followed by legislation prohibiting all
but large stills, first encouraged the Lewis in a taste for
strong drink; then tempted them to smuggling and breaking
the law; finally established many distilleries at Stornoway,
importing barley for the purpose. By 1825 these had ousted
the illicit stills, but they were closed about 1830.

175 From a peritoneal narrow margin of subsistence, periodi-
175 cally overstepped in fortune, the Islanders passed to a
454 larger measure of production for sale, and in the second
175 half of the eighteenth century population increased. Its

1 CE. D. Stewart of Garth, *Sketches of the Highlanders*, 1822, vol. 1, p. 2.

2 *Brand Report*, 1901.

176 growth followed the increases in potato-growing and fish-
176 ing and manufacture of kelp, and the introduction
454 of vaccination against smallpox, which had formerly taken
175 a heavy toll of child life.[1] The increase found an outlet
175 in emigration to the Colonies, often led by departing tack-
175 men though discouraged at first by the Island lairds. For
example, in July 1773, 840 people sailed from Lewis.
"Alarmed by this, their master . . . came down from
454 his seat and chased the southern chieftains in smacks. What
are the terms asked, think you? 'The land at the old
175 rents, the augmentation paid for three years back to be
remitted, and the Factor to be dismissed immediately'."[2]
214 Although the *Edinburgh Evening Courant*, from which this
quotation is taken, went on to say that it was expected that
the demands would be acceded to, or the Island would
become a desert, the Factor was retained.

175 The emigration was encouraged when the
175 appalling conditions of transport overseas are remembered.
175 A sum is known to have been assigned to emigrants sailing from
the Clyde across the Atlantic in a vessel for which the
maximum human cargo of negro slaves permissible was
400. The regulations governing the transport of slaves
did not apply to the transport of 'freemen'. In quoting
this case, D. F. Macdonald suggests that while it was in
the interest of slave-owners that their slaves should arrive
in the Plantations alive, it was rather in the interest of
manufacturers to discourage emigration so as to keep a
supply of labour at home with which to meet their growing
demands and fill the gaps due to a high mortality, par-
ticularly among workers newly arrived from the country.[3]
It would also seem as if it had not been in the interests of
landlords to encourage emigration. Population at Red Time,

1 *Brand Report*, 1901, p. 10.

2 *Scotland's Defying Population*, 1750-1850 (1940).

176 ceiss as Tarbert and another village was erected in The Pro-
176 district by Leverhulme. Leverhulme also appears to
454 have introduced 'Automatic' hand-looms into Lewis.
175 Tweed, in 1914, was a very popular material, but the
175 Lewis, a few, and a few sheep on the outrun, and perhaps
175 a small loot.

Commercial fishing and weaving cannot, however, be
satisfactorily combined, for seasonal alteration of occupa-
tion entails waste of gear and plant, and interferes with
efficiency. Thus in the North Lochs fishing 'creels'
(Lanthorst neighbourhood, immediately south of Stornoway),
weaving became important, but none of the seven
large herring fishing boats (still registered in 1930) had
a quarter share, which was to say that it was their idle and
rotting, and by 1938 only one was still registered. In South
Lochs, however, motor-boats were purchased, but there
is little weaving. An obvious reason for the difference is
the accessibility of the North Lochs area by rail to
Stornoway. Light passenger and carrying vans to the village,
besides groceries, etc., and take away rolls of tweed. South
Lochs, on the other hand, considerably further from
Stornoway by road, is still within reach for marketing fish.
In North Lochs, merchant seasons at home and young men
go to their crofts from three months' work in East Coast
fishing boats, turned increasingly to the 'Automatic' looms,
manipulation being easily learnt; but such intermittent
work alone gives little hope of progress. There is no more
fascinating problem than the future of improved weavers.

2. *Unemployment and the Island Budget*

174 In the past, the storms of the Atlantic washed up on
731 the Island shores the wreckage of world commerce; and
434

fragments of spars and other needful things lacking on
the Island, and were utilized by and carefully distributed.
So, after 1919, from the wreckage of modern industry
borne on the ground-swell of Depression[1], there came
to the Islands the frail raft of Unemployment, and the
small loot.

Some assessment is therefore required. The total
amounts of relief disbursed before 1931 were compara-
tively small, but they certainly exceeded the sum of
the crofters' contributions to the Unemployment Grant
Fund. After a couple of months of wage labour at road-
making, immediately after the War, many men were
qualified for 'the dole'. Furnished with this, they re-
turned to their crofts and employment gave out, to
start in their peat, collect stones for a new building, or
out with a rod for a little fishing from the rocks. All this
was done "on the spot" and the men were legitimately
their names were duly inscribed at Stornoway Labour
Exchange as seeking fresh employment. Not a few prayed
that 'employment' would not come inconveniently soon
as they would then be legally bound to accept it and to
leave the crofts. No doubt, even if such a job was offered
received was urgently needed, the surplus was not squan-
dered, as it might have been in a town. Extra cash, if ac-
served to buy a loom here, fencing for the garden there,
and other things of permanent use. Yet morally it consti-
tuted misappropriation of relief. As a result, through no
real fault of their own, young men began to lose inde-
pendence and self-respect. This general problem for youth
was widespread in years of 'depression', and it was
peculiarly severe both in industrial Clydeside and the
fishing villages of Scotland, and also throughout the
'depressed areas' of northern and western Britain, of
which the Lewis and Harris are the outstanding

APPENDIX I

ECONOMIC ASPECTS OF LEWIS (AND HARRIS)

Introduction

174 THE assessment by the Lewis Association in their first Report
on the Economic Position of Lewis (proper) in 1938 shows the
Income derived from "productive industry".[1] This was defined
as that which "produces or tends to produce exchange value",
and therefore excludes the immediately domestic, of the production of
existence by crofting as well as saleable commodities. This
income covered the tweed industry and agriculture, and
touched upon fishing.

434 For the first, the tweed industry, the figures are reliable,
and the income for 1938 was £146,000 paid in wages, salaries and
wages in 1938 was a remarkable element of the Island income,
more than half going to the crofting or agricultural population.
the tweed industry was estimated to provide over £300,000.
For the same year, the value of the tweed stamps and
stock, combined with agricultural returns, were sufficiently
reliable to give fair confidence in the estimate of production of
nearly £200,000 (more precisely, £194,100). For the 3730
crofts an average value was obtained of nearly £56. To this was
added the peat cut on the crofts, averaging £24, thought by
some to be rather a high value. The work of building and
improvement of houses was not included and this has been
added, with an estimate of £40,000. For fishing (the third
chief source of production mentioned in the Report), the
income derived from local boats has been distinguished
from that earned by visiting boats; by combining official
statistics with personal, local inquiries. From this fresh
analysis a figure of £83,000 is offered here.

APPENDIX I

An effort has been made to separate crofting from other in-
come, and to obtain an average for the Island, based upon the
total rural households, numbering 4200, composed of those
of the 3730 occupied crofts plus an estimated 500 others, rural-
cottars and squatters, and 'fears'—i.e. holding land in fee.

174 Finally, the production income accounted on the Island there
should be added that received by earnings sent or brought
home to dependants, together with pensions, unemployment
relief and the like. I am greatly indebted to the appropriate
officials for the figures relating to 1938 or the year immediately
preceding. These sources average £45 per rural household.
The figures for relief all appear in the Report; but many figures
have been short-lived. The author is responsible for all
the concluding Table (pp. 314-315) bears a note on
other sources of income, which is a further table for 1935.

(i) *Tweed Industry*

After deducting the cost of wool imported from the main-
land and certain other costs, the net productive income was
£146,000 in 1938. The estimate may still err on the high
side but it indicates the prime importance of the industry in
the Island. For 1938 the figures for tweed stamps and
certified as land-woven by the Harris Tweed Association
Ltd., was 1,879,000 yds. (with a figure for cloth alone of 1,840,000. By
4,000,000 yards, though falling therefore. The value of the
annual production by crofters was £46,10 per £50. The income
total wages paid in 1938 amounted to £146,000 (£139,000),
rather more than half of which was paid to the weavers working
at home. In 1936 this had risen to nearly £200,000, a slightly
higher proportion falling to the weavers.

434 In addition to the wages paid and the price paid for local
wool, the industry is a valuable customer of the Electricity Com-
pany and directly or indirectly provides much other employment
in the Island. The industry also provided a market for a large
quantity of Scottish wool and contributed to taxation.

174 The productivity and earnings of the industry continued to

APPENDIX I

be high until 1948. There was a remarkable peak year for the pro-
duction of Harris Tweed, with over 5,000,000 yards (of which
4,000,000 were stamped, and some 1,300,000 unstamped).
In 1948 the production of unstamped tweed had fallen to
300,000 yards but stamped tweed came to 4,380,000 yards.

Then, in the year 1948 the imposition of a 66 per cent
purchase tax struck the industry a crippling blow. The rise
in prices of wool increased difficulties, and by 1950 five orders
were being booked and men were being paid off. A few small
firms who had adapted to the purchase tax were still operating,
but they corresponded to the enduring fulfilment of a prime
prophecy, and "tweed" was not produced. Thus formed a little to
the 'stranger' total of close on 5000 tons. As the Stornoway
Trading Company Limited, which owned a third of the
herring fleet, there remained only some 600 tons of herring
barely an eighth of the stranger total. A fifth, say, of the
stranger probably met less than a fifth of the catch but is
still smaller fraction of the same paid for it, for the cream of
the prices is obtained by the first and the last, generally the biggest
and faster of the fleet. If we set against the catches probably
the 5000 tons, the total catch of the winter fishing
(about 15 per cent of the year's total), we shall still err on the
side of the total of the Stornoway fleet. Also in to estimate what fraction
of these sums may be included in the net output of the Island
industry (see Appendix I). The Board of Trade's *Statistical Tables and*
Annual Report extract the produce brought in by local boats
from the total, separating it from that due to 'strangers'; and
representing a fairly reliable estimate, checked by local enquiry.

Of the herring taken, nearly 80 per cent were caught in the
summer fishing, June to August (*Annual Report*, p. 13). The
week of maximum local activity in herring fishing for Stornoway
District may be taken to be increments of £38,000 for the District
(Table II). These were then 111 steam-boats engaged; and as
only five were locally registered (at Stornoway itself), the
remaining 106 were strangers. There were also 66 motor-
boats engaged and though 81 motor herring-boats are locally

APPENDIX I

registered at the various 'creeks', obviously all cannot have
been engaged; moreover, the strangers are invariably greater.
Thus of a given unit-of-time would probably be conservative.
The two sums, local and stranger, are added.

Now, the average net tonnage of a drifter or a good East
Coast motor-boat approached 40 tons, almost double the
average tonnage of a local motor herring-boat (20 tons), and
the catch was much in ratio. During such a week and
period, the total net tonnage of the stranger drifters was
about 106 × 40 tons, or say 4000 tons. That of strange
motor-boats may have been, say, 66 × 20 tons, or 800 to 900
tons, but the local tonnage was only 44 × 20 tons, another 800 to
900 tons, or, say, 1000 tons in all. Thus formed a little to
the 'stranger' total of close on 5000 tons. As the Stornoway
Trading Company Limited, which owned a third of the
herring fleet, there remained only some 600 tons of herring
barely an eighth of the stranger tonnage. A fifth, say, of the
stranger probably met less than a fifth of the catch but is
still smaller fraction of the same paid for it, for the cream of
the prices is obtained by the first and the last, generally the biggest
and faster of the fleet. If we set against the catches probably
the 5000 tons, the total catch of the winter fishing
(about 15 per cent of the year's total), we shall still err on the
side of the total of the Stornoway fleet. Also in to estimate what fraction
of these sums may be included in the net output of the Island
industry (see Appendix I). The Board of Trade's *Statistical Tables and*

still smaller fraction of the same paid for it, for the cream of
the prices is obtained by the first and the last, generally the biggest
and faster of the fleet. If we set against the catches probably
the 5000 tons, the total catch of the winter fishing
(about 15 per cent of the year's total), we shall still err on the
side of the total of the Stornoway fleet. Also in to estimate what fraction
of these sums may be included in the net output of the Island
industry (see Appendix I). The Board of Trade's *Statistical Tables and*
Annual Report extract the produce brought in by local boats
from the total, separating it from that due to 'strangers'; and
representing a fairly reliable estimate, checked by local enquiry.

Of the herring taken, nearly 80 per cent were caught in the
summer fishing, June to August (*Annual Report*, p. 13). The
week of maximum local activity in herring fishing for Stornoway
District may be taken to be increments of £38,000 for the District
(Table II). These were then 111 steam-boats engaged; and as
only five were locally registered (at Stornoway itself), the
remaining 106 were strangers. There were also 66 motor-
boats engaged and though 81 motor herring-boats are locally

228 boats; value, £15,400. Of this, the greater part came into Lewis creeks (Table 17), making £10,000 for Lewis.

434 Finally, we may add a round figure for whole or part-time occupations associated with the fisheries, including what accrues by the visiting fleet and its business, of, say, £20,000. This gives a total net output approaching £85,000 from fisheries for a typical year just before 1939.

[462] We now turn to an estimate of the earnings of fishermen and of the women engaged in curing. To some extent these figures overlap, for the value of the net output includes the wages of fishermen and women; but the sums earned on 'stranger' vessels—reduced now to some £3000—and the wages earned by women gutters and curers in East Anglia [436] (about £10,000) are additions to Lewis income. Some of this was, no doubt, sent home in the form of postal orders, etc., causing a further overlap, but much of it was probably sent in the form of notes or brought home in cash. In order to show the real net earnings of rural Lewis, these are separated from the output shown in the first column ((A, i) on p. 314) and are tabled under "Earnings by Crofting and Associated Rural Occupations only" (A, ii).

[127] (*b*) *Fishers' Earnings.*—As no figures of local earnings are separately published, estimates must be based upon the colla-tion of the Fishery Board's *Annual Statistical Tables* and [178] accompanying *Annual Reports* with careful local enquiries. By 1938 the fishermen on Stornoway District herring fishing vessels were reduced to about 350 men and boys in the summer season, of whom only a few worked in autumn and winter. Their earnings included the earnings of share owners of boats and of nets, and of those without shares, the latter being only a fraction, say a quarter, of the total. Nearly 100 District men still worked on 'stranger' (East Coast) vessels at the summer fishing and rather fewer at the East Anglia autumn fishing. The sum so earned may have been a third or more of the earnings on District vessels. Altogether the total net earnings from herring fisheries received by all fishermen from Lewis proper came to little more than £8000. By 1938 the

question, whether it would be better to change from the Orb trade and go to power looms. Then you would be able to do any kind of cloth. You wouldn't be tied down to regulations as you are with the Harris Tweed. To do that after all it cost them with the court case a few years back--. But, at the same time, it's more important to have work than this trademark. As it is at the moment, it's just a white elephant."

Neilie Leoid

Neilie Leoid left school in 1931 at the age of 14, as easy-going and generally content with things then as he is 40 years later. "When I was going to school lots of people hated the headmaster, but I had no complaints against him. Perhaps people are inclined to blame other people for their own failures. Of course, I didn't like school very much, and I didn't go to it all that often.

"In those days you didn't have the same access to education as the young people have today. You didn't assume you could go very high. You were quite content to settle down to weaving. The boys started learning from anyone who was around. I started weaving with my uncle when I was 15, on an old wooden loom. In one winter we earned the L26 to buy a single-shuttle automatic. My uncle's eyesight was getting sort of dim, so I would

RECENT STATISTICS (1953–54)

128 In briefer form, the basic economic data can now be reviewed,
433 in the same order, for 1953, or the period April 1953 to March
1954, as available. The results are shown on the second pair
434 of Tables, pp. 318-319.

(i) *Tweed Industry* (1953–54)

434 Taking 5,000,000 yards as the 1953–54 total, and accepting
an estimate of 1s. 2d. paid to weavers per finished, mill-shrunk
288 yard, payments to weavers in Lewis-and-Harris (and a few in
463 the southern Hebrides) would amount to some £291,700. After
subtracting the output from Harris, this corresponds to an informal estimate by the Lewis Association for Lewis proper of well over £250,000 and more, probably £275,000 for the period. Adding the wages of spinners in Stornoway mills, and also of carriers, dockers, etc., it is thought safe to double the figure, with £550,000, for Lewis, rural and urban. Most of the weaving is rural. The increased use of daily bus transport allows rural dwellers to come to Stornoway daily to earn and so has increased the ratio of rural to urban wages by spinning and other labour. For rural carriers and mill-employees, a fifth of £275,000 is taken here, making £55,000. As no estimate for the 'net earnings' in Lewis is available, the same ratio to wages is taken as in 1938, making £1,200,000.

(ii) *Agriculture, Peat-making and House Building* (1953)

178 (a) *Agriculture.*—First, the trend of crop and stock pro-
duction can be indicated by selected figures for the Island for
434 1918, 1939 and 1953. The areas both of oats and rotation
241 grass increased, the three successive totals in acres being, for
oats: 4460, 5020, 5440; and for rotation grass: 390, 1385,

APPENDIX II

178 2110. The acreage under potatoes declined steadily: 3940,
434 3730, 1650. Barley dwindled from 2350 acres to 1340, and
130. Turnips reached a maximum of 510 acres in 1939, but
241 were not worth noting by 1953. These crop acreages reflect
the change in stock-rearing, with the decline in the number of
178 cattle but the great increase in the number of sheep. Taking
the three successive totals for 1918, 1939 and 1953, cattle
434 numbered 13,620, 9060 and 6540 head; but this diminution
231 by more than half was chiefly due to the small number of
bullocks reared. Cows and heifers, 7650 in 1918, still stood at about 4500 in 1953, and they are now of far better quality in weight and milk production. The totals of sheep were successively, 78,150, 114,330, 185,860; by use of mainland rams their average weight has increased, while the wool is rather more abundant but coarser. Taking the Lewis Association's equivalent of 1 cattle beast to 8 sheep, the livestock carry increased by nearly 25 per cent; and if we add the increased value of the cattle the livestock increase counts for very much more. Horses, it is true, fell to 380 by 1953; as before, most had been bought in from Uist, not bred. Hence a new charge on agriculture, the purchase and use of the 65 tractors owned by farmers and crofters, and their running costs, is relatively less heavy than it would be in a horse-breeding area. The poultry are still deplorably few: 86,460, or about 20 per croft.

[632] The Table on p. 316 sums up the conditions, apparently
somewhat stabilised for the time being, parish by parish, and
invites comparison with Chapter II, pp. 67-68.

178 (b) and (c) *Peat-making and House-building.*—While *peat-*
222 *cutting* is still important, more coal is used than formerly, and
hence the peat is valued here much as in 1938. *Housing* is
314 most important; Local Authority housing by the Burgh
struggles to meet the need of a growing urban and 'suburban'
178 population as in other towns in Britain, but with an additional
362 "remote area subsidy" to meet mainland contractors' extra
647 costs. There is little truly rural housing by the County Council
and rents are too high for the houses to be fully occupied. The
63 figures for Stornoway Burgh for the ten years 1945–54 exceed
[162]

APPENDIX II

178 300 houses, with nearly 30 built by "private enterprise"; in
362 addition the Local Authorities built 140 in the immediate
647 'suburbs' (of which 50 were temporary), a total of over 470
63 and an average of, say, 47. Another 115 were built in the rural
[439] townships. If we give a round total of £125,000 as the value

178 for an average year (such as 1953) for Local Authority Housing,
362 we may allot half this to net output of local materials and to
647 wages earned by Lewismen, some £65,000, of which rural
63 wages were a small fraction, say £20,000.

435 For crofters and cottars, however, in 1953, a fairly typical
year, there was much local effort and achievement, by help
434 of 180 loans and grants from the Department of Agriculture
for Scotland, totalling £81,000 for new houses or house im-
647 provements (with a very few steadings). £80,000 may be
allotted to local materials and to labour paid or given by house-
654 holders themselves.

APPENDIX II

434 228 [439]

(iii) *Fishing Industry* (1953)

The renewed Russian contracts for herring have meant loading of Baltic shipping at Stornoway with barrels of herring cured both in Stornoway and Ullapool. Catching power in Scotland generally is hardly enough to meet this contract. Thus, while the numbers of boats continued to decline after the war, leaving only one steam and 33 motor drifters (over 30 feet keel) registered by 1953, the fishermen employed rose to 610, of whom some 520 were crofter-fishermen. Many worked much of the year; on the other hand, most of the winter catch went for 'oil and meal' at about 50s. per cran instead of the top price of over 80s. For local boats a figure of £30,000 is suggested for the catch of herring, say £10,000 for white fish, with £5560 for shellfish. For "curing and associated income" the pre-war figures may be doubled. [178]

(iv) *Other Sources of Income earned in the Island* (1953)

434 465 [657]

In mid-1953, of just 5000 registered for the Island as employed—and other than the self-employed, *i.e.* the farmers and crofters, the hand-weavers and the boat-sharing fishers—1130 earned by the three industries first named, the rest by other trades and professions, 3870 in all. The unemployed numbered 1180. Analysis of wage-rates would throw light on total earnings. As to unemployment, the fact that, like crofters and many fishers, hand-weavers count as 'self-employed' means that when out of work they are not covered by unemployment insurance, and have to be helped, at low rates, by public assistance.

(v) *Allowances, etc.* (1953)

434 657 436 729

Turning now to Remittances, to the manifold categories of Pensions, National Insurance and National Assistance, and to Unemployment Benefit (a small item), the Table B, 1953–54, shows the totals kindly furnished for this study, with £1,017,110 for all Lewis and an estimated £977,010 for rural Lewis.

APPENDIX I

average wage for the summer season dropped to about £25.

The number of women engaged in gutting and packing (and kippering) herrings varies from year to year. In 1938 1000 were engaged locally in summer, most of whom also went to East Anglia. As always, the greater part of the wages was earned in the summer and the remainder in the East Anglia (autumn) fishing season. The net average earnings per worker of the Scottish gutters and packers were estimated at £16 at the Scottish summer fishings and £17 at the East Anglian fishing (*Annual Report*, p. 12). This figure included 'arles' (*i.e.* earnest money), but excluded travelling expenses. The Stornoway District earnings averaged £16 at the local summer fishing but only £15 at the East Anglia fishing. The latter is a small return to place against the skill of the worker and the discomfort she endures. The women work in small teams together, and their efficiency is partly due to their comradeship.

Figures for catches have already been given as approaching £20,000 for herring and £10,000 for white fish and shell-fish. While the net earnings derived, after subtracting the working expenses of boats and outlays for gear, were very much less than this gross sum, a substantial part should be counted as equivalent to earnings (Statistical Table 21).

Summing up the total net earnings, we arrive at the following for Lewis proper. The women's total net earnings may be taken as £25,000. We add to the probable earnings of the men at the herring fishing an allowance for their profits from other catches, making a total of say £15,000.

The industry was still declining here as elsewhere in Scotland. About 1930 the earnings of hired hands alone reached £30,000 and that of women twice as much, say £60,000. Besides this was the important sum earned by men with share of boats. The local white fish and shell-fish catches were also considerably higher at that period. As to the future, much will depend on what can be done to rehabilitate the local industry by compensation for losses incurred in war, and by assurance that government policy will encourage local fishermen to embark on their enterprise without the risk of the

APPENDIX I

crippling losses suffered after 1914–18. A beginning has certainly been made. The Herring Industry Board's scheme for 'Queen of Scots' kippers will help the Minch fishing. It will not necessarily help the ports of Stornoway or Tarbert, because herring can be landed at mainland ports and treated there or else taken by road to the Moray Firth, kippered there, and still qualify under the scheme. The Scottish Agricultural Organisation Society has aided the marketing of lobsters to good purpose.

(iv) *Other Sources of Income earned in the Island*

It is to be hoped that members of the Lewis Association may ascertain these, perhaps in collaboration with University research workers. This, in turn, might instructively be collated with the imports and exports of the Island, which are recorded and ascertainable with a precision impossible for a similar area on the mainland. Thus the facts would throw light on the economy of other crofting districts.

(v) *Allowances, Pensions, Unemployment Assistance and Remittances*

With regard to money received by the crofting communities of Lewis from other than 'productive' sources, figures have kindly been made available regarding three sources, namely, (*a*) Allowances made to members of the Forces and their dependents, and Pensions, (*b*) Unemployment payments, and (*c*) Money Orders and Postal Orders. The yearly periods for which figures are available are close enough to permit of reasonable comparisons. Among other sources, Bank Drafts form an insignificant fraction of monies received by crofters from outside the Island. It is impossible to say how much cash is brought home by men paid off from the Merchant Service and other employment, or how much may be sent through the post in the form of notes, whether registered or unregistered. The amount is known to be large, however, and an estimate based on the number of insured employed, and other figures, would be of value. A token figure is suggested in a note to the concluding Table.

APPENDIX I

For the year 1937–38, Allowances paid to members of Forces and their dependants in Lewis (proper) came to £40,0 Of this sum a greater part was paid through Stornoway P Office than might have been expected from the town's pop tion. But able-bodied recipients of Allowances are attrac to the town by the likelihood of finding work there, w men of higher rank and pay are apt to be townsfolk, and t dependants also. Old Age, Orphans' and Widows' Pensi exceeded £80,000. Of this sum a relatively large amount also paid through Stornoway Post Office, partly for admi trative reasons, rendering other causes harder to disentangl

We turn now to the next source named, Unemploym Assistance. The Bureau made payments of £120,000 in 193 the last year for which relevant statistics were made availa Of this sum, about one-third was Insurance Benefit, derivab principle from the joint earnings of workers, and two-th were Public Assistance, contributions to which were made f local rates. The fraction paid to Stornoway workers relatively small, and may be estimated at barely £10,000, of rural payees accounting for the remaining £110,000. the Means Test took account of the croft (or smaller hol with house), the average payment to individuals was small.

Turning to Money Orders, and taking the balance of ment and issue at face value, there was actually an outflow f the Island instead of an influx, for the issues exceeded the ments. In Lewis in 1937–38, whereas nearly £60,000 issued in Money Orders, only a little over £30,000 was p Even allowing for the fact that part of the payments is cas through banks or cleared at a central Post Office on the m land, there would appear to be an outflow, as central clearances probably amount to no more than 35 to 40 per c The amounts in Postal Orders paid were smaller, total £23,000, and the difference between payments and issues

Comparisons between town and country are instruc Stornoway's position as a shopping centre is reflected in heavier average of Money Order payments per head per an as compared with rural areas (£8·4 as against £1·1); and

difference between the issues and the payments in rural areas (£28,000 as against £13,000) is no doubt due to orders drawn to pay accounts. In this connection, a comparison of conditions at an interval of nine years is suggestive for any attempt to distinguish the difference between rural incomes before and after the economic depression. In rural Lewis the total Order payments fell from over £33,000 in 1928–29 to barely £22,000 in 1937–38, a fall of more than a third. Although a decline in the payment of Money Orders in Stornoway was partly offset by an increase in that of Postal Orders there, it is thought that even this reflects a fall in the cash available in the townships, by indicating a fall in the average amount of accounts paid by country customers to Stornoway tradesmen. Even here, it is true, some allowances must be made, as latterly more shopping was done by customers coming into Stornoway by car and probably paying to a greater extent in cash.

Comparisons may now be made, for all the data quoted, between Stornoway and the rural or 'landward' areas of Lewis, and also between landward parishes for all except the Unemployment payments. Population having changed but little from 1931 to 1938, and economic conditions not being very different in the Island in the financial years 1936 and 1937–38, an approximation can be made of payments averaged per head of population. In the following table these are shown in £ sterling to one decimal place.

Average Payments (per Head per Annum)

	Stornoway Burgh	Stornoway Landward	Barvas	Lochs	Uig	Average Landward
	£	£	£	£	£	£
(a) Allowances and Pensions	10·2	3·3	4·0	3·6	5·9	3·9
(b) Unemployment Payments	2·6	..	..	..	..	5·1
(c) Money and Postal Orders	(8·4)	1·0	0·9	1·2	1·3	1·1
Total	..	..	..	..	..	10·1

The significant figure here is the average total payment per head in the rural or 'landward' area, a sum of ten pounds sterling, the complexity of urban conditions, even in a small town, making the total for the Burgh less significant. To put it differently, an average rural household of 4·5 persons thus received a sum of £45 a year from these sources.

All these figures—pointers to the complete facts, unascertained as yet—show that even with the help of these sources the average income of the rural Islanders was small. Comparisons of such figures with those for the rest of Britain would, of course, be misleading. To those who spend their working lives outside their native isle, Lewis is no more than a home; and for them it should therefore be compared to some urban suburb or 'dormitory', rather than to an urban centre of production or a typical agricultural district in the Lowlands.

It may help to compare the conditions of 1938 with those of 1951 if, say, average weekly wage earnings for all British workers in employment are taken for October of both years. Thus, taking the 1938 earnings of 53s. 3d. as 100, those of 1951 were 141s. 1d. or 265 per cent of the first, a figure to be related to the cost of living index which had only risen from 100 to 202 per cent. The total wage-bill gave a still higher increase for Britain, from 100 in 1938 to 287 per cent in 1951. As food forms a heavy part of the doubled cost of living to people in poverty or near it, the crofters' own food does not greatly relieve them. The loss of employment following the close of the mills left little for them but to seek employment beyond the Island.

Summing up the facts of this Appendix, it may be said that the Island furnishes (1) means for partial subsistence for most; (2) means of earning a livelihood, for some; and (3) a home from which many go forth to earn a living for themselves (and their families) elsewhere—meantime contributing to national and local income there. Of these, many return later, either to found a home, to pay visits on holiday or during periods of ill-health or unemployment, or to retire upon the Island.

231 summer, were last used for cattle six to eight years ago by people in Brenish, but none are in use today. These shielings were at the western foot of Mealisval, only about a mile from the township. The Brenish 'distant' shielings, about six miles to the south-east of the township across the mountains, were not used after about 1920, while the adjoining Islivig shielings were last used in 1922. Mangersta may have had its original shielings to the east of Loch Melavat about a mile south of the township, but after obtaining the enlargement from Mealasta farm, until about 1939, shielings were used in that area.

314 No peats are cut on the crofts; the peat-cutting areas for all three townships are near the road and in no case far from the township. The common pasture near the crofts bears
241 evidence of former cultivation, but it is at least fifty years ago since crops were grown on it. At this time the townships of Islivig and Brenish were over-populated with many cottars living on the crofts and all possible land on the crofts was already under cultivation. Today, less than half this 'old arable' is being cultivated, and in several cases the land is used solely for hay and grazing.

342 There are now no thatched houses inhabited in the townships and most houses have kitchen and other extensions added. Some crofters have built concrete two-storey byres
312 of modern design. In Brenish, where the hills to the east provide a good catchment area and the Brenish river a good source of supply, all the crofts have their own private piped water supplies, while in Islivig and Mangersta most crofts now have, or are getting, a
377 water supply. All croft houses are supplied with electricity from the grid.

226 Commercial fishing has long ceased and as there are only three boats there is now very
501 little fishing for domestic use, the principal use of the boats being to ferry sheep to the off-shore islands. Weaving is an important occupation. There are seventeen weavers -
286 nine in Brenish, two in Islivig and six in Mangersta, and during 1959 they were kept busy; in 1958, however, few orders were received. Weaving cannot be said to bring in a steady
464 income here, and some of the weavers, and others, find additional employment outside
[434] the township - this includes four men at the hydro-electric scheme at Gisla, three at Mangersta Ministry of Civil Aviation station, three at Aird R. A. F. station and at least
[467] one in the Glen Valtos quarries. In addition, one man owns at tractor which he hires
[445] out, and one, owning a lorry and van, does haulage work. Altogether, out of a total of twenty-seven men under sixty-five who do work, all but three (one just out of school and one a semi-invalid) have other employment in addition to their crofts.

162 The total population for the three townships is one hundred and twenty-one residents, and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are children of, or below, school age, forty-seven (39%) are in the 15 - 45 age group, 15 (12%) are in the 45 - 65 age group, and 31 (26%) are over 65. Of the resident tenants, thirteen are over 65, twelve under 45, and five between 45 and 65.

181 The relatively young population may help to account, together with the better soils, for this area giving an impression of a fairly prosperous crofting district compared with some of the others in Uig. Amalgamation of crofts into larger units has also gone further. The use of a tractor or horse for ploughing, extensive use of artificial fertilisers, the sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of people who are determined to make the most of their limited resources.

233 One enterprise, that of the Aird Bheag sheep farm, deserves special mention. Four crofters (three from Brenish and one from Islivig) have purchased from the Uig shooting estate about 2,000 acres of land on the Aird Bheag and Aird Mairs peninsulas, five miles south of Mealasta. Here they are running a flock of about five hundred sheep. There is

427 Tables 16 and 18 support the definition of a croft as a small livestock-economy unit,
311 primarily concerned with the provision of milk for the family and young cattle and wool for sale. There are no cash sales of crops - the whole of the land-use is directed towards
231 the subsistence of the crofter and his stock. The cereals (almost entirely oats) and the hay (occupying a very small proportion of land for a livestock farming region) are grown
[241] for winter fodder for the cattle and sheep. The larger part of the croft is given over to
[246] grazing - usually of poor to medium quality - which receives very little attention from the crofter. Less than one third of the holdings have sown grassland (and in these few cases it is normally less than half an acre) - a fact which suggests a passive rather than active attitude of the crofter towards his land.

[244] In addition, every croft has its own small potato plot - rarely more than half an acre to provide for family needs, and most crofts (58%) possess a vegetable garden - again for house use.

[433] Nearly all the crofts carry one or two cows - the second cow ensures a milk supply all the year round. Young stock are sold at one year to eighteen months old, rather than as calves - a result of the incentive offered by the calf-rearing subsidy. The milking stock is replaced very infrequently.

427 Where one croft differs from the next is in the numbers of sheep stock. Table 17
233 shows an even distribution of crofts with more than fifty and less than fifty sheep; but, in
[434] fact, over one third of all crofts have less than twenty-five sheep. Sheep are the only source of money income on the croft, except for the annual sale of the calf, and subsidies, and there is a considerable difference in the size of sheep stock between the truly subsistence and "retirement" crofts on the one hand and the "commercial" crofts on the other. Hence the scuming figures, and here note the contrast between Valtos with the sheep stock equal to 111% of the scum and Kneep - 353%!

000 An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on

TABLE 18
LAND USE

	Valtos	Kneep	Reef
243 244 246 Average size of holding:			
311 Old arable	2.5	4.1	11.0
427 231 Outrun	2.8	6.2	
Percentage of croftland under:			
cereals	7.5	7.0	6.0
potatoes	2.5	5.0	3.0
Sown grass (hay)	5.5	1.0	5.5
natural hay	3.5	10.0	4.0
natural grazing	75.5	76.0	75.0

An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on the individual croft to the size of holding and to the availability and age of the labour force. In both diagrams there is a significant division between the subsistence holding (0 - 7 units) and the commercial holding (11+ units), but there is no definite relationship between stock and size of holding or labour availability. The inclusion of the points of equilibrium for certain lines in Figure 20 reveals a somewhat unexpected state of affairs: in the case of crofters with regular work and full time crofters, those over the age of forty-five carry a larger stock from those under forty-five. It is frequently argued that the solution to the economic problem of crofting lies in the amalgamation of holdings in order to create a more viable economic unit, but the indication from these diagrams is that an increase in the size of holding will not, of itself, lead to an increase in stock. It is the absence of accessible markets that deter the crofter from increasing his agricultural production.

In their present state the crofts in the Valtos area are unable to provide a livelihood for the crofter and his family. Of the crofters under sixty-five almost 90% supplement the croft income by other employment. Of these casual labour (at present mainly at the Gisla hydro-electric scheme) accounts for 57% regular work - particularly weaving - 43%. The combination of crofting and weaving provides probably the best return for the labour: one crofter with a croft of 3.3 acres, carrying two cows, two followers and ninety sheep (sixty ewes) made the following estimates for 1958:

FROM THE CROFT:	
Sale of two year-old calves	£80
Cow and calf subsidies	£40
Sale of wool at 4s. 3d. per lb.	£75
	£ 195[1]
FROM WEAVING -	
at two tweeds per week (32 hrs. p.w.)	£550
GROSS INCOME	£745

Weaving about 30 hours a week apparently leaves him sufficient time to run the croft efficiently; at present a crofter supplementing his income by a labourer's wage at Gisla hydro electric scheme would have to put in nearly sixty hours per week to achieve the same financial reward.

The economy of the Valtos peninsula has been changing, and contracting, for several years. The number of unoccupied crofts is increasing; commercial fishing ended at the time of the first World War; the shielings have been abandoned as summer cattle pastures. The Valtos shielings near Loch Scanadale were abandoned during the 1939 - 45 war, due mainly to the lack of manpower in the township, though some was used intermittently until 1953. The shielings of Knasp and Reef were abandoned in the late 1930's, at which time Knasp had some fifty milk cows as compared with fourteen in 1959.

[1] Against this figure, must be set the costs of production (i.e. fertilisers, new seed, winter fodder supplements, sheep dips etc.)

Since so much of the year is spent either upon or near the crofts it is but to be expected that greatest losses of Island sheep will take place in the summer when they are far from supervision upon the hills; this contrasts with the mainland Highlands w heaviest losses, apart from those due to sudden snow falls, generally come about lam time, when this takes place upon the hill, or soon after, in cases when the ewes and lambs are put to the hill too soon. On Bernera Shore on the other hand losses are heaviest on the hill in winter. Losses are extremely uneven in their incidence in tim and from croft to croft. The cause of loss varies: there are no serious endemic diseases now, and there are few coastal cliffs - a frequent cause of loss in other plac There are however some boggy areas in the interior and some rugged: whether or no there are losses due to vermin particularly eagles, is a debatable point. Probably t fundamental cause of loss is lack of shepherding and adequate day-to-day oversight up the hill.

There are certain special pastures that show interesting features. The Flannan Islands have excellent pasture, especially for the poorer male shearlings which need bringing on. There is all-the-year-round grazing for fifty sheep, which is shared by two crofters in Crulivig and one in Earshader. Unfortunately, the difficulty of gettin a boat to go across has meant that for the last two years no visits have been made, a after one or two years unattended, the animals become quite wild. Since 1949, when the Croir tenants were first permitted to cut peat upon the Bernera shielings, they ha ceased to do so on Vacasay Island, where they now each send two sheep for summer grazing. They also send one sheep each to Euglam Island from 15th May to 16th Aug One croft in Tobson includes certain small islands:

Bearsay Island (16.4 acres; soumed for 12 sheep per annum)

Eilean Fir Crothair (4.6 acres; soumed for 5 sheep per annum)

Seildeim (1.0 acres; soumed for 3 wedders per summer)

Similarly, Valasay (part of Tobson), has Eilean Liongain Valasay which provides summer pasture for two young cattle beasts or five sheep (one per croft). One croft in Crulivig has a small offshore island taking two hogge during tupping and at least o crofter in Crulivig also grazing on Ben Sgurain, but there has been no success in the attempts to heft stock there. It is distant and unfenced; losses can be heavy.

Lewis is a very restricted market for livestock: the general practice in the Bern area is to sell cast ewes at five or six or even more years to the butchers in Stornow Lambs may be sold on occasion, but generally they are kept either for replacement o sale as three-year wedders.* The losses which occur, plus a certain amount of sla ter for domestic use, prevent long-term accumulation, though periodic fluctuations n be severe. Occasionally when there is a surplus of summer grazing, the Bernera S townships may buy in lambs from the western coast of Lewis, carefully eschewing th raised on the machair lands, which are said to be too "soft" for the hills. These ar reckoned a gamble, they may or may not "take". The practice may be compared wi that of the former Linshader Farm where, to take up the summer surplus of feed, y cattle were bought from the crofters.

The wool from the Lewis Blackface sheep generally varies from three to four lbs per fleece. There is no longer any hand spinning; most wool is either sold outright sent to the mills for spinning and dyeing. This practice is of long-standing. Even before the Great War, when the rent formed by far the most important item in the m tary affairs of the croft, the wool was either sold outright or, more commonly, sent the mills for spinning and then taken to a weaver; the tweed was then sold either loc or to a merchant in Stornoway, the proceeds being used for the rent and other items.

Cattle, as has been pointed out, have declined greatly in relative importance sinc 1883: they are fewer in number - though far better in quality - and consequently sub

*Three-year wedders in good condition fetch about £6 for slaughter. Carcase weig is about 44/45 lbs., sometimes as little as 38 and sometimes as much as 55 lbs.

Lark Fly and Pack mice to gather in the same way now though the large plodders, which they have been unable to do since the coming of the rabbits, are still with us. They have been unable to do so because they have been driven by the rabbits from their old haunts, which they now occupy to the exclusion of the rabbits. Some 20 years or so ago according to the farmers of the district, rabbits were not in evidence in the Ulg area, but they came in with the rabbit plague of the 1930's and have been there ever since. Rabbits are now the most numerous of the mammals in the area, and, in contrast to the Lowlands, the comparable figure is around 100. Other sources try to maintain the rabbit population at a low level, but they are not very successful, and the rabbits are a pest to the farmers, who have to protect their crops from them by fencing and spring traps and shooting them at night when they are feeding.

Rabbits are not the only pest which cause the late nineteen-twenties Soils II 2, neither while the Highland Soils are concerned, but they are the most numerous and the most destructive. Rabbits are a pest to the farmers, who have to protect their crops from them by fencing and spring traps and shooting them at night when they are feeding. The most destructive of the mammals in the area are the rabbits, which are now the most numerous of the mammals in the area, and, in contrast to the Lowlands, the comparable figure is around 100. Other sources try to maintain the rabbit population at a low level, but they are not very successful, and the rabbits are a pest to the farmers, who have to protect their crops from them by fencing and spring traps and shooting them at night when they are feeding.

Rabbits are not the only pest which cause the late nineteen-twenties Soils II 2, neither while the Highland Soils are concerned, but they are the most numerous and the most destructive. Rabbits are a pest to the farmers, who have to protect their crops from them by fencing and spring traps and shooting them at night when they are feeding. Other sources try to maintain the rabbit population at a low level, but they are not very successful, and the rabbits are a pest to the farmers, who have to protect their crops from them by fencing and spring traps and shooting them at night when they are feeding.

Apparently 2/12 above the rabbit source of the difficulties which confront the community. Rabbits are not the only pest which cause the late nineteen-twenties Soils II 2, neither while the Highland Soils are concerned, but they are the most numerous and the most destructive. Rabbits are a pest to the farmers, who have to protect their crops from them by fencing and spring traps and shooting them at night when they are feeding. The most destructive of the mammals in the area are the rabbits, which are now the most numerous of the mammals in the area, and, in contrast to the Lowlands, the comparable figure is around 100. Other sources try to maintain the rabbit population at a low level, but they are not very successful, and the rabbits are a pest to the farmers, who have to protect their crops from them by fencing and spring traps and shooting them at night when they are feeding.

There is no indication of means of stock-farming age in other tops of or bulgers in the Highland Soils, and the Highland Soils are concerned, but they are the most numerous and the most destructive. Rabbits are a pest to the farmers, who have to protect their crops from them by fencing and spring traps and shooting them at night when they are feeding. The most destructive of the mammals in the area are the rabbits, which are now the most numerous of the mammals in the area, and, in contrast to the Lowlands, the comparable figure is around 100. Other sources try to maintain the rabbit population at a low level, but they are not very successful, and the rabbits are a pest to the farmers, who have to protect their crops from them by fencing and spring traps and shooting them at night when they are feeding.

This was no always be a good thing. Farming is a pain in parts. Land the land is good, farming is a pain in parts. Land the land is good, farming is a pain in parts. Land the land is good,

The Lowland Farm Holding Tenancy Court Records are discussed predominantly in Gulvin, Tenancy, 1973. The records of an old varying tenancy, Ballochmyle, Ayrshire, are discussed in Caird, Ayrshire, 1959. The decline of the old varying tenancy is discussed in Caird, Decline, 1956, and the rise of a tenancy which has the decline of the subjects in view, Tenancy, 1959. Tenancy Court Records are also discussed in Caird, Tenancy, 1959, and in Caird, Tenancy, 1973. Tenancy Court Records suggest a further decrease in the tenancy holding size.

An examination of the population statistics proves interesting, especially when compared with Gulvin, Tenancy, 1973. The population of the parish of Lochalsh in 1755 and 1831 was similar in large considering that there are six unoccupied crofts. Eleven of the crofts have more than one house occupied by a family, and there are 14 houses in ruins. In 1831 there are 1,000 people in 1,000 houses. The population of the parish of Lochalsh has increased by 1,000 in 1831 to 1,000 in 1831. Tenancy Court Records show the population of the parish of Lochalsh. Lochalsh provides a striking contrast to other Crofting Tenant crofts in the moving age group. Lochalsh provides a striking contrast to other Crofting Tenant crofts in the moving age group.

Factors of the tenancy of the crofts which are moving into other crofts are contained in Gulvin, Tenancy, 1973, and Crofting. A further eight supplement their croft work with regular employment in the nearby towns of Inverness and Dingwall. Lochalsh provides a striking contrast to other Crofting Tenant crofts in the moving age group. Lochalsh provides a striking contrast to other Crofting Tenant crofts in the moving age group.

Income from the tenancy has continued steadily since the tenancy court records in 1755. Nevertheless, Lochalsh has a larger proportionate resident population than most tenancies.

Lochalsh is a tenancy with a stable population and with good farmers and good farmers. Lochalsh has relatively low, with four exceptions, which are in the tenancy. Lochalsh has a tenancy which is a tenancy which is a tenancy which is

8 suit.

Apart from this time honored principle and other legal considerations, closure of the Minch will not be feasible until the Hebrideans have a larger catching potential. This potential depends not only on capital for building fleets and facilities, but also on a casting off of conservative attitudes regarding modern innovations and techniques. In short, a fuller adjustment to the demands of the commercial world is required. Additional problems to be faced include efficient handling of this highly perishable item. At present boats from the northern end of Skye have only a limited local market. If they miss the steamer in the morning, they might just as well throw the fish overboard. A consideration of lobster fishing will indicate the nature of these problems.

Lobster fishing is an especially suitable part-time occupation for crofters. Particularly in favor of the industry is the fact that it can be turned to whenever croft work is slack. Then, too, there is a fairly constant demand for lobsters at a high price. In recent years the value of lobsters and whelks, the only other shell fish exported in quantity, has exceeded that of all other fish combined. Lobstering adds substantially to the incomes of the crofters around Broadford and Kyleakin, in the Staffin area of Kilmuir parish, and in the Braes and Portree districts of Portree parish. It was formerly important in Glendale. Indeed, between 1942 and 1949 there were few crofter-fishing townships which did not share in the profits from the sale of lobsters. It should be noted that shell fish are exclusively an export

The estimated income from the sale of stock and produce 434
nts to some £66 per holding. One of my informants, an 231
culturalist of wide experience, thought that the estimate 241
too high. He would put it at £126,000, or £55 per holding.
ddition to the actual production, we must consider govern-
subsidies and grants.

The most important subsidies are those on hill sheep 654
hill cattle. Each of these average over £30,000 annually. 231
e are also calf rearing subsidies, marginal land grants,
several other available sources of aid which amount to
£20,000 each year. Thus, the total income for the Skye
ters and farmers is increased by roughly £80,000. Pro-
ion and subsidies together give an average income of
t £100 per holding. We have already seen that the crofter's
me may be either a fraction of this figure or several times
average income depending upon the size of his croft. To
y understand the significance of this fact and to explore
her the evidence for cultural continuity, it is desirable
nquire into the seasonal routine of the crofters of Skye.

The Annual Economic Cycle

As crofts are delimited according to size and potential 221
ne, the crofters may be classified as full-time, part-time,
spare-time pastoral agriculturalists. Obviously, all
ters who work the land will follow a similar schedule,
orming more or less the same variety and succession of
s. There are, however, significant differences in the

175 a crew member. Another family is called "cook," the
228 first job which a novice had to assume when he joined
404 the crew of a fishing boat. One of the last men to go
[551] to the east-coast fishing is about 60 now. The men
[221] came back from the fishing in time to bring in the oats,
[241] barley and potatoes, and the money was used for rent
[434] and the purchase of various foodstuffs and other goods.
[353] They usually brought enough rolls of wallpaper to cover
the stone-walled or wood-lined tigh dubh (black house)
[434] for another year. Twenty pounds were good wages for a
season. While the men were away at the fishing, the
[452] remaining members of the family lived on credit from
[571] the local shops, and depended on the good will of
their neighbors.

175 Many men joined the armed services, and were
701 especially sought after by the Navy and the Merchant
706 Service. In 1900, there were 2,500 Lewismen in the
505 Naval Reserve.

175 Around the turn of the century, until the first
228 world war and the growth of the weaving industry, the
484 girls used to "follow the fishing." "Everyone came to
[571] the boat to see you off. You could go all the way to
[435] Aberdeen for 12/6 on a special fish-worker ticket."
The girls went from the south of England to Shetland
in the far north.

For example,
a Widow Catherine lost "one red
175 mare and foal (L10), one dun cow (L3/10), and one dun
421 heifer (L1/10)." One family is said to have paid rent
[435] by being fiddlers for "the castle" (the home of Sir
[551] James Matheson), thus earning the patronymic, "Fiddler."
Their income stopped abruptly when the fiddler at the
time, a great-grandfather of descendants now living,
converted to the Free Church and smashed his instrument.

In 1899 and in 1905 it was noted in the rent ledger
that two crofters wanted "first chance of a vacant croft
in the township." In the first quarter of the century,
[628] a conflict ensued between Shawbost and a neighboring
[764] township over the extension of a cemetery; land was too
precious to take out of cultivation and give to the dead
of another village.

173 A 65-year-old man recalls, "Men got their living
241 from the land and sea. They kept more cattle when I was
[233] young. They used the dung of the cattle to fertilize the
[237] soil. The entire croft was used. My father's croft was
only 2½ acres, but he worked it well and harvested eight
stacks of barley to see us through the year." There were
173 a number of kilns to dry grain, and mills along the streams
243 to grind the barley. The "old Norse mill" which was
252 recently rebuilt by the school children as a school project
[251] was in operation from 1920-1934. "Then the tweeds got
[897]

286 of potato crops by blight had contributed to widespread
195 poverty. The production of cloth for non-local markets
731 was promoted initially by philanthropic proprietors in
735 an effort to ameliorate such conditions. Lady Dunmore,
286 of the Dunmore family that owned Harris during most of
195 the 19th century, was largely responsible for developing
741 a market in London and elsewhere for cloth woven in Harris.
439 The cloth was popular first among the aristocracy, who
[565] wore it for hunting and other sporting occasions. The
[438] romantic image of a cottage industry promoted for charitable
[435] purposes contributed to the market value of the tweed.

The market expanded in the second half of the 19th
century, aided by ladies of leisure who followed the example
286 set by Lady Dunmore (cf. Hunter 1964: 24-26). The
441 production of cloth for a commercial market spread from
195 Harris to the southern isles, but was slow in coming to
[964] Lewis, where the proprietor, Sir James Matheson, provided
the people with construction jobs. After Matheson died in
1878, weaving for outside markets began in Lewis in the
parish bordering Harris, and the name "Harris Tweed" was
used because a market for cloth of this name had already
been established. By World War I, weaving for outside
markets was being done in all four parishes in Lewis. In
1899 there were 55 looms in Lewis and over 200 in Harris.

288 developed from the concentration of power in the hands
195 of the merchants. In the early days of the industry,
441 all the processes involved in the production of a
286 finished length of tweed were carried out by individual
236 families. A man used wool from his own flock, and with the
438 aid of other family members, dyed it with vegetable dyes,
195 carded and spun it by hand, wove it, washed and shrunk
[386] it, and found his own buyer. Dyeing wool, spinning yarn,
286 and washing ("waulking") the finished length of tweed
236 was usually done by women. In Harris, the entire process
438 of producing a tweed was carried out by women, but in
195 Lewis the weaving was done largely by men.
462

A woman in her 80's recalls the process of weaving
175 when she was young. Hand-spinning had died out by this
286 time, although the question of whether tweeds woven with
such yarn could legitimately be called Harris Tweed was
not resolved until 1934.

"About 1916 or so it took about two weeks to a month
175 to do a tweed. You bought the wool from the Agricultural
283 Board. Sixteen bags of wool, costing about L20, would
[435] do four tweeds. You needed four one-stone bags per
[433] tweed. Then you would spend a day gathering a bag of
[389] crotal (lichen scraped from rocks and used for dye). One
[824] bag per one bag of wool was required for the dye. After

286 on commission for weavers around the turn of the century.
289 By the early 1920's, four mills on the island were
195 carding and spinning wool on commission; and one mill
198 brought looms into its premises. Lord Leverhulme, who
[226] bought Lewis in 1918, saw the value of concentrating
[283] weavers in one place and of improving the technology.
He encouraged the introduction of Hattersley domestic
[463] looms, which eventually replaced the wooden looms. The
individual weaver also did his own warping, but after
World War II the mills began to hire warpers to work full
time on mill premises. Transporting the tweeds, which
used to be the responsibility of the weavers, is now the
responsibility of the mills. Today all processes except
the actual weaving are handled by mills, most of which
are located in Stornoway.

Such steps in specialization and centralization made
sense to the weaver. One of the older weavers recalls,
175 "In the late 20's or 30's you could buy a yard of Harris
286 Tweed for about two shillings. It wasn't economical for
288 any crofter to dye and spin the yarn, weave it and sell it
435 for only two shillings a yard. As the mills enlarged,
they could make it with the machinery because they could
make it an economic proposition."

However, the tendency toward specialization and
195 centralization was in direct conflict with the reasons
286
288
828

175 behind the tweed's popularity. The tweed was more than
286 a cloth; it was peat smoke and windswept moorland, the
288
[829] image of the free man who had escaped city life and machines and was the master of his own destiny. Steps had been taken all along the way to preserve the image of home-crafted goods, as when, in an effort to prevent machine-spinning, carding mills were built in Lewis and Harris at the turn of the century to prevent wool from being sent to mills on the mainland, where it was both
[685] carded and spun. As early as 1906, a man was convicted in London of selling power-loomed tweed under the name
288 "Harris Tweed." Today power-driven looms can produce
402 double-width cloth 54 inches wide, a width much preferred to the 28-inch cloth produced on the Hattersley loom because there is less waste when the cloth is cut. But because "Harris Tweed" must be hand-woven, new looms of light-weight metal are being designed on which double-
• [435] width cloth can be hand-woven. The new looms will cost so much that many weavers say they would be unlikely to invest in them, especially given the uncertain future of the industry.

175 The Harris Tweed Association, formed in 1909, was
178 granted a certification mark by the Board of Trade which
288 was stamped on tweeds that were hand-spun and hand-woven
44
[424] in the islands. During World War I, hand-spinning died
[286]

175 out in Lewis, and the Harris Tweed Association was
178 ineffective in enforcing its standards. In 1934,
288
286 weavers were allowed to use yarn spun in island mills,
441 and production increased; but no weaving was allowed to be done in the mills. All looms were removed from those mills which had tried to centralize this stage of production. The actual process of weaving remained, by legal definition, decentralized, although the word "crofter" was changed to "islander," thus widening the category of persons who could weave "Harris Tweed," and paving the way for centralization of weavers in the town of Stornoway.

286 Any person can purchase his own yarn, weave his own
288 tweeds, and sell them to tailors or summer tourists;
467 but before a weaver can weave for the mills, he must be registered with the Weavers Union. The Weavers Union is a branch of the Transport and General Workers Union, which includes mill employees, hospital workers, lorry
288 drivers, and others. It is an anomaly of the Harris
467 Tweed industry that workers classed as self-employed should join a union of employees and is another indication of the centralization of control and power in the mills, with whom the weavers, along with the mill workers, bargain
288 for higher wages. Weavers receive a basic sum of over
• 435
466
804 L10 for each length of tweed, which is usually 38 weaver's

465
• 435 yards (a weaver's yard is equal to 8 feet, a measure
288 which derives from the size of the frame once used
[804] to wind hanks of yarn). Payment varies according to the number of colors used in the pattern. A weaver
288 may average 2½ tweeds per week when the work is available,
465 thus earning more than mill workers. A female mill
[562] worker earns about L11 or L12, and her male counterpart about L3 more.

288 Because weavers are classed as self-employed, they
745 do not qualify for unemployment benefit. They may apply
657 for social security, but must submit to a "means" test, and the possession of bank savings or other assets disqualifies them from receiving such aid. All British workers must pay a weekly sum for "insurance stamps," a certain number of which makes the workers eligible for small payments from the government during periods of illness. Self-employed persons must pay for their own insurance stamps, whereas employers pay for the stamps of their workers. A weaver who does not keep up with his payments of over one pound a week for insurance stamps must pay the accumulated debt at a later time.

471 Weavers face other costs. They buy looms and bobbin-
288 winding machines, and pay for lighting, heating, and the
288 maintenance of all equipment. The preservation of this
463 anomalous status of "self-employed" is related to the
438

175 the 1934 decision to change the word "crofter" to
178 "islander") led to the weavers living in council
288
[361] houses in town and working in loomsheds behind the houses. Unequal distribution has also contributed to Shawbost's relative prosperity, and to the decline of weaving in more remote parts of the island. The
[444] unequal distribution of tweeds has made it difficult to maintain a large labor force, which in turn limits the growth and development of the industry.

288 <u>3. Instability of the Industry</u>: The Harris Tweed
433 industry has undergone a number of crises. Periods of
178 depression have alternated with periods of prosperity.
[458] (See Appendix B for the fluctuation in the number of yards stamped each year with the Harris Tweed trade-
• [435] mark.) The very conditions which give the tweed its
[466] market value—the decentralized, non-mechanized human element—also limit the possibilities of growth in the industry, and contribute to the industry's instability.

288 When a business remains small, it must collect
441 orders before it can provide work to have the orders filled (except when demand for an item is strong, as occurred around the time of the previous world war; during the war and for a few years after, tweeds could be made first and then marketed, because any cloth
[471] could be sold). Only a large business can keep weavers

764 178 [493] Today coffins are brought to the cemetery in a hearse, but the procession still carries the coffin for a half mile or so to the hearse. The women gather outside the house in the biting wind, huddled together, beginning to sob as the heavy line of dark-coated, slowly-moving men bear part of themselves away. In one village on the west side, the women circled the coffin as it left the house, chanting, "You are leaving us, you are leaving us!"

764 [767] [435] Graveyards are maintained by members of the community. A cemetery committee collects dues of five shillings a year from all households for the upkeep of the cemetery. Relatives and neighbors dig the graves of their fellow villagers.

767 In 1911, a funeral society called the West of Lewis Funeral Association was founded with the original intention of bringing back the bodies of men and women who had died when they were away from the island "at the [435] fishing." Persons from Borve to Berneray pay two shillings a year to the Association, which at present has about L4,000 invested in bonds. A similar association exists in other parts of the island. A person may join between the ages of 12 and 40, after which he is not eligible for membership. A member who has left the island must continue to send in his dues, or members of

175 261 [132] [443] During a huge snow-fall that occurred on Lewis in the 1950's, the mobile grocery vans and other supply vehicles could not come out to the west side, and a group of men had to make an expedition into town for provisions, after which many families made certain that they always had a good supply of meal, salted [404] mackerel and herring. Many villagers have gotten deep [365] freezers to store beef and mutton; others say they do not trust the freezers, that a failure in electricity--which occasionally happens in this region of gales and far-away repairmen--would bring disaster if they depended fully on them for keeping their meat. When the tweed 458 226 industry is going through one of its periodic depressions, more men go out more often to fish. "I've been going out every night for the last week or so. I don't have a tweed, and I won't have one for the next six weeks. I don't know what I'm going to do; maybe I'll go back to sea. Three of us caught one hundred mackerel last [251] night. I salted my share, and didn't give any of them away. These are the hard times. We're going to need them during the next six weeks."

233 [654] A few people raise beef cattle, depending largely on subsidies for encouragement to do so. A few are [234] beginning to keep cows again for milk, giving as their [435] reasons that freight charges make the bottled milk too [434] [648]

233 234 435 434 648 costly, that the Common Market will soon drive up milk prices, and that income from the weaving has become too uncertain.

412 178 Many tools and techniques associated with crofting have disappeared: the flail for threshing oats (two pieces of wood joined with leather); the sheepskin stretched over wood with holes burned into it, to separate chaff and grain; rope made of plaited heather and straw. 241 [221] [237] [824] Each spring the byre was cleaned of its accumulated dung and urine, and this was turned into the ground along with seaweed. Such tools and techniques remain among [173] the older villagers as a "memory culture" which may be [887] mobilized under changed conditions, as when alternatives to crofting are no longer available or are too costly. However, the longer crofting is neglected, the less it will provide an alternative strategy. "The artificial 241 824 fertilizers are ruining the land; that's why the turnips are full of maggots and the potatoes turn to [233] water." As the rushes grow and clog the drains and streams--rushes that used to be eaten by the horses and cattle and which are now left untouched by the sheep--the land becomes unfit even for grazing. "I'd rather work the land than the blinkin' loom, but we tried the potatoes, turnips and cabbage last year, and lost them all to the maggots. You lose heart after that."

273 differentiation and differentiation in personal experience,
571 but to use it in the community, as social coin. The few
156 men who refuse to get involved in drinking episodes that
178 would deplete their available funds are called "mean"
434 and "tight-fisted."

"If I had a wish, I'd choose to live the same life all over again, maybe a wee bit rougher. We don't get a chance here. The poverty keeps us down. But what does it matter to be a schoolteacher or a minister? What good does it do you? If I have a shilling in my pocket, I've got to spend it. I remember ten years ago, I went into town with L60 in tweed payments to buy a new stove. I met some of my [435] pals, so I put L20 down on a L50 stove and spent the rest. What a time we had."

[484] "I went for a holiday on the mainland and came back with money in my pocket because it's no use drinking in a place where you don't know people. You want a yarn."

273 Drinking occurs at night behind the gray, concrete
571 shield of the bothan or in hotels. Drinking situations
156 provide opportunities, rare in the repressive arena of the
154 village, to express emotions and ideas. These expressions can always be retracted in the cold, sober light of day.

"I used to be an alcoholic. Now I spend most of my weekends feeding my brother lager so he won't get the DT's. When something good happens, I wish like hell I could get

[Page 159 is blank; text continues on p.160
--Analyst]

*159 288 they leave school, and most of them get married. I remember about twenty girls working there, and they all
[458] got married, and another young girl would start. During the slack periods some men would be paid off. They would start in other jobs, and wouldn't be prepared to
*159 464 come back. If you weren't working in the mill you were weaving; there was road work on a very small scale. Except for sailing there was nothing else. For the last ten years or so the big contractors have given people jobs.

"I started with a building contractor but preferred to come back to this job, for the main reason that I had
*159 288 458 built this house here. We had slack periods, but we picked up again. But this slack period, it's been two years now, and I don't think it will pick up again, unless they go to a wider cloth. Probably the fashion has changed. People have gone on to other types of cloth. And the merchants and tailors prefer a wider cloth, it's less waste. But that means changing the loom and a lot of machinery in the mill as well.

"I'm sure the weavers wouldn't be prepared to put
[435] out the extra cost for wider looms. At the present time, a loom and winding machine cost close to L400. You can imagine what a wider loom would cost, up to L1,000. They don't want the power loom. They're trying to hold onto the Orb trademark for as long as they can. That's the big

*159 288 458 question, whether it would be better to change from t
Orb trade and go to power looms. Then you would be
able to do any kind of cloth. You wouldn't be tied d
to regulations as you are with the Harris Tweed. To
that after all it cost them with the court case a few
years back--. But, at the same time, it's more impor
to have work than this trademark. As it is at the
moment, it's just a white elephant."

Neilie Leoid

*159 Neilie Leoid left school in 1931 at the age of
as easy-going and generally content with things then
he is 40 years later. "When I was going to school lot
of people hated the headmaster, but I had no complaint
against him. Perhaps people are inclined to blame oth
people for their own failures. Of course, I didn't li
school very much, and I didn't go to it all that often

"In those days you didn't have the same access to
education as the young people have today. You didn't
*159 288 [868] assume you could go very high. You were quite content
settle down to weaving. The boys started learning fro
anyone who was around. I started weaving with my uncl
[434] when I was 15, on an old wooden loom. In one winter
[435] we earned the L26 to buy a single-shuttle automatic.
My uncle's eyesight was getting sort of dim, so I woul

rley have been replaced by grass and hay. Conceivably, this 178
a more complete adjustment to the environment, which has been 231
de possible by integration with a commercial economy, than 241 433
adjustment to the demands of the outside world. Whereas
e objective of the local economy once was the export of
ttle, today the purpose is the breeding of cattle and sheep
r the national markets. We have seen that there are a host 182
limitations and difficulties in the economic aspect of the 231
lture. Many of these are due to the persistence of con- 241 433
rvative practices. Each crofter must keep pace with his [624]
adition-practicing neighbors, with the old men of the town-
ip. Others are the result of an inhospitable environment.
e economy does not run smoothly, but this is not conclusive
idence for disorganization. Integration does not mean
both functioning. In the spring and autumn the crofter is
nfronted with a variety and succession of tasks which would
ll a specialist with dismay. Very often, these pastoral
d agricultural chores have to be carried on in conjunction
th outside employment. In return for his labor, the crofter [134]
ceives a meager income, frequently supplemented by con- [657]
l bu tions from his children or the government. As a further [167]
sult of the partial adjustment to the wider society and
lture, the people leave the island to seek employment and
achieve an upward mobility impossible on Skye. Economically, [175]
ve, along with most of the Highlands, may be viewed as
esenting a picture of the Lowlands of Scotland 200 years ago.
at is the extent of the economic adaptation of the Sgiathanach
the national culture.

178 311 232 233 [578] "The cattle give too much trouble." A smaller scheme is grazed only by sheep. On the schemes where mixed grazing is practiced, a number of conflicts arise between those who have only sheep, and those who have cattle as well. To accommodate different demands, one township scheme was divided with a fence; cattle were put in for a month in one part, and then shifted to the second part. The sheep were then brought into the first half. All stock had to be removed from the scheme a month before the lambs were weaned, so that all worm eggs and other harmful elements in the dung of animals previously present would have time to die. What was once used for a single purpose by everyone now has to be divided.

[435] [578] "I paid one pound a head to put cattle on the reseeding," says a man named Iain. "Now I have to move them off already. Those sheep people want it for themselves. I won't use it if they're going to be like that. Next year I'll have the use of two crofts and my apportionment. And now that I have my own tractor I can put a load of sand at the bottom of the croft to make the grazing better." [409] [242]

311 233 232 829 According to another person, who also keeps cattle on the reseeding, "Some people want to move their livestock on and off the schemes when it suits them, like Iain,

175 228 [348] [439] [171] 175 648 228 On one of the crofts along the strand are the ruins of two curing houses, where the fish were salted and dried. Ling, cod, skate and halibut were cured and sold to local merchants for export. "The same as they do in Iceland this very day. That was the main industry. Then the English came with their steam trawlers; they ruined the fishing here, and then went west to Iceland and the Faroes. In Iceland they get fined for poaching, but here the trawlers often ignore the three-mile limit. But the fishing was the mainstay here, before the Harris Tweed came along." [433]

175 228 435 501 One man returned from sailing in 1932 and bought a boat for L24. He had 32 lobster pots, and made L7 one June by selling the lobsters at a shilling apiece. [454] [471] Another man, who returned from the United States in 1934 because of the depression, bought a share in a 14-foot boat. It was made in Ness, at the northern tip of Lewis, and cost about L14. He and his partners went out every night possible; the fish provided an important part of their income. The boat was sold in the 50's. "It wasn't being kept up anyway." Around World War II there were as many as twenty boats; men fished at night, after a day's work. Today there are four 12-foot boats in Shawbost, each shared by four or five men. The boats are used intensively for fishing during certain times of the year, [434] 175 228 501 178 501 228

EIGHTEENTH-CENTURY ECONOMY

but their negligence even in ye article appears from their sending 439 out annual above 2000 of wool out of the country unmanufacture.' 175*

Harris was rented at £600. Exports were some 100 tons of 427 kelp (£325), and the value of 250 black cattle exported alive, with 436 • 100 salted, was £445. Small quantities of cheese, wool, and the skins of sheep, otters and seals were exported. Grain was neither imported nor exported.

The plough, which is used here, and in most places of the long 407 island, is of a very peculiar construction. Its length is but 4 feet 175* 7 inches, and is drawn by four horses abreast. It has but one 492 handle by which it is directed; the mold board is fastened with two leather thongs, and the soke and coulter are bound together at the point by a rim of iron. Beside kelp, there is little else manu- 175* factured, except a little coarse woolen yarn, and some blanket- 439 ing, which they send yearly to Glasgow. They raise a little flax 286 of which they make some coarse linen for their own use, but im- 248 port all the fine linen which they consume. In the year 1756, an 399 American vessel in distress was obliged to put out three hogsheads of lintseed in Harris, which was sown and afforded crops of lint which were above double the value of the usual crops. The east 228 and west of Loch Tarbert in the Harris are every year revisited 175* by the herring shoals. During the five years from 1743 to 1747, the west loch was the principal seat of the herring fishery. About thirty vessels from 18 to 40 tons, belonging to Campbelltown, Greenock, and Irvine, were completely loaded each of these years at this place.

With even a modest amount of business taking place, it was a 443 natural step to establish commercial facilities. Stornoway men who 175* once acted as agents became shopkeepers. The increase in the use 453 of money attracted banks. During the Seaforth ownership of 436 Lewis, the island had its own currency or notes, designed and 175* printed from plates in the same style as the modern banknote. The wording ran: 'I promise to pay on demand to the Chamberlain of the Lewis or Bearer ONE POUND Sterling at the Counting Room here.' The notes carried a date and were signed by the proprietor, J. A. Stewart MacKenzie. It is not known for certain how long the notes remained in currency, when they ceased to be used, or even whether they were officially acceptable. At one time, as rare 523 items, they fetched high prices from collectors. A number were

TRADE AND INDUSTRY

288 Thus were laid the lines of a new form of economic organisa- *175 tion for Lewis. At first, tweed manufacture here, as in Harris, was 462 strictly a domestic activity: the wool of the crofter's own sheep was clipped, washed and dyed, carded, spun at home, and woven into cloth by persons in the township with the skill to produce a suitable cloth; the weaving was a part-time and mainly female occupation. Payment for the weaving was in kind: peats, potatoes, or labour. The waulking or finishing of the cloth was mostly a communal activity carried out by the womenfolk, who turned it into a particular social occasion with definite feminine characteristics. If the cloth made was in excess of domestic requirements, the crofter sold it directly to a customer, or else the local shopkeeper bought it or gave credit for it.

288 With the rise in weaving for a definite market in Lewis, all this 463 changed. Weaving became a full-time specialist occupation and, *175 partly because the flying shuttle made the work heavier, it be- 462 came predominantly male work. With the use of mill-spun yarn there grew up a number of merchants, the Lewis 'producers', who 288 bought yarn either locally or from the mainland, and put it out *175 for weaving and hand finishing on a commission basis. The yarn 441 and the resulting cloth remained their property. At times the cloth embodied a handspun weft; at other times perhaps no handspun was used at all. As pointed out above, it was marketed as Harris Tweed, as was the 100 per cent handspun cloth, yet it cost about 21d to produce compared with 36d for the 'real' tweed. The cheaper type provided Lewis's rapidly-expanding output between 1900 and 1911, and by that year Lewis had outstripped Harris. In 1912, the handspun yardage produced in 433 Harris was 175,000; partially and wholly millspun accounted for some 4,000 yards; and the total value was £26,500. In Lewis the yardage of handspun cloth was some 10,000; but about 340,000 yards of partially or wholly millspun was sold. The total Lewis • 435 value was £44,000.

The trade mark

288 When eventually the question arose of some mark to distinguish 441 between the two cloths, it was with difficulty that the Harris mer- *175 chants persuaded the Board of Trade that a distinction was neces- 424

TRADE AND INDUSTRY

382 sent to several shipping ports, and the response was good; one *175 Liverpool chandler even offered to take the whole output at a good price. But again the product was rendered useless, this time by being subjected to a partial-distillation process, in the thought that this would improve it; orders stopped. One shale-oil firm offered to take the crude peat tar to refine along with its own products for the purpose of modifying the flash-point of the oil it was itself manufacturing. Most commercial enterprises would have jumped at the chance of disposing of their output without the need for the always-tricky refining process, but here personal interests intervened and another avenue of profit was blocked.

The Lewis Chemical Works had by this time become something of a showpiece, chemists and scientists mecca-ing their way to Stornoway to see both plant and product. One eminent chemist pronounced the plant one of the most successful ever erected for the distillation of hydrocarbon oils from peat, and an Irishman said that if the Irish Peat Company's installation had been as successful as the Lewis counterpart, Ireland would have been enriched by her peat bogs. By the middle of the 1860s a ton of peat tar was being produced for 70s, as against 100s for unrefined • 435 shale oil. Peat oil sold at first at 2s 9d per gallon, then dropped to 2s 6d and finally to 2s, presumably as the American oil products were reaching the market. The writing was on the wall. Sir James Matheson, realising too late that perhaps a closer control should have been applied to the venture from the beginning, decided to cut his losses and close the works. All the metal—condensers, pumps, stills, pipes, and tanks—was broken up and sold for scrap. Nearly four miles of light railway had been laid from the Creed Works to the peat bogs; this was lifted for scrap. So ended the first phase of industrial Lewis. The venture proved, however, that with adequate skill and knowledge success could be grasped.

Bricks, printing, whisky

339 The brickworks which Matheson built for £6,000 at Garra- *175 bost produced building materials and some fine examples of drain- 396 ing tiles, but has now disappeared. The Patent Slip built at *175 Stornoway for another £6,000 was able to take ships of up to

[TEXT CONTINUED ON PAGE 127]

THE OTHER ISLANDS

*175 even to the extent that the St Kildans used their observations of 18 the flights of birds both as compass and as omen for good or evil. 826 Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naively at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, 276 HMS *Flirt* sailed from Greenock with food to relieve hardship 931 among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island con- 262 sisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from 272 March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond 342 of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the 392 Western Isles'. All were well furnished, peat was used for fuel and 405 there were two watches and one clock on the island. There were 162 some seventy-five islanders; most of the men were old, and only two of them were unmarried, with twelve spinsters still to choose 212 from. All read the Gaelic Bible. The men were mostly tailors, shoe- 463 makers and weavers; every house had a loom. They made all 214 their own clothing, the men also making the women's dresses, 286 and a good deal of blanketing and tweed cloth was made and sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each 462 croft and house was rented at £2 annually, sheep being charged 429 for at the rate of 9d per head; these charges were usually paid in kind.

439 Feathers of the sea fowl formed the principal export of the • 435 island. The factor paid 6s per stone of 24 lb for black feathers; 237 and 5s per stone for grey. For these he received, in Edinburgh or

ST KILDA

Glasgow, between 7s and 10s per stone. For tweed made on the 439 island, 27d to 30d was received per yard; for blanketing, 28d. 436 Cloth was measured by the 'big yard', which was 49 inches. The factor bought cheese at 78d per stone of 24 lb. The prices paid by the islanders for commodities imported included 25s per boll for meal and oats; 3s per cwt for salt; 7d for coarse sugar; 5s per lb of tea; whisky cost 4s per bottle; and tobacco was 5s per lb. Leather for soling boots cost 24d per lb; for uppers 27d. Bonnets for the men were 4s each; cravats, 3s. Physically, the 142 islanders were in good condition at the time of the *Flirt*'s visit, with an average height of 5 ft 6 in, though they showed a tendency to flabbiness. The prevalent illness was rheumatism, with 164 dyspepsia running a close second.

CHAPTER IX

ECONOMIC CHANGES: 1750–1919

(a) TRANSITION: MIGRATION, FISHING AND KELP-MAKING

175 UNTIL the 'Forty-five the township had lived an
433 almost self-contained life. Its traditional economy
(621 was self-sufficient except for two indispensable
427 commodities—salt for the housewife and iron for the smith.
794 Beyond this, the chief demand for payment was the rent
430 to the lord, with tithes for the kirk. For these needs and demands a step towards production for exchange was required, the more so that what was exported might include the very necessities of life in 'bad years'. The rent was paid largely by the sale of a surplus steer or two, and
175 drovers called for the cattle. By 1790, if not before, two
317 or three open boats set out annually from Uig, for instance,
436 for Glasgow, laden with salt beef and dried salt fish. Although salt seems of little account today, it once bulked
•435 large in the Budget, its price being heightened by duty, especially after 1707: "as dear as salt", was a saying, *cho*
251 *daor ris an t-salluinn*. Salt was needed to preserve the carcase of a 'cattle-beast' or sheep killed in autumn, and
175 for cod and herring curing. Wrecks were valuable, as on
433 all infertile undeveloped coastlands, both for their timber and their iron. Cairds or tinkers occasionally brought
326 metal goods; or a packman called, as strange a figure then
443

ECONOMIC CHANGES: 1750–1919

000 landlords to improve passenger regulations at that time.
175 Wars brought enlistment in the Highland regiments,
162 the Navy and Merchant Marine. Owing to migrations of
all kinds, males came to be outnumbered by females, then
702 as later (100 males to 114 females, 1931).[1] In Lewis in
167 1795 the proportion was 100 to 111, and in Harris 100 to 124. From this period onwards the 'export of men' con-
175 tinued, modified by the reserve for war. Men were trained
162 for the Naval Reserve and Militia; and in 1900 for instance
702 800 men were training at Fort George and 2500 sailors were in the Reserve. The maintenance of a reserve for the Navy was one of the strongest pleas for the framing of the Crofters Act.

175 A new resource, important to the Islanders after 1750,
824 was kelp-making, the cutting and burning of seaweed upon
323 the shore, for use in the manufacture of alkali in the glass
388 and soap industries. From 1770 onwards the price rose, heightened first by an import duty, then by the Napoleonic
175 Wars. Estimating from the high prices, averaging over
824 £10 per ton from 1800 to 1823, Sir John Sinclair put the
•435 value of the annual produce (20,000 tons) at £200,000. "It may appear surprising", he remarks, "how that sum could be of such importance to 80,000 people"; but he goes on to point out that this gave the additional cash needed to supplement their subsistence. But even when Sinclair wrote in 1825, the industry was in peril. Failure and loss occurred almost immediately after, with disastrous effect.

175 It is complained in the *New Statistical Account* that
433 owing to the summer-time work of kelp-making up to
1830, the people could give little attention to the crofts, so
511 that their extension must almost have ceased. Nor could

[1] In 1951 the ratio in Lewis was 100 males to 112 females, and in Harris, 100 to 110.

BETWEEN TWO WARS, AND AFTER

185 applications for shares in the division of a farm, but where
114 Leverhulme now felt sure of his success, an old crofter spoke up slowly: "My Lord, what the crofter wants iss
185 *Contemplaition*". Now, fondness for contemplation is
114 found not only among crofters as they age, but among
181 older fishermen all round the shores of Britain, even if it mellows in the Isles especially. Yet, as Leverhulme saw for himself, there was abundant activity among men in their prime, as they strove to refit their boats on their return. In 1919 hope, not contemplation, was their prevailing mood: hope for an active, fisherman's life.

With all these hopeful human factors on the side of common effort at the start, why then did differences of view-point come to be accentuated, not harmonised, and
159 'incompatibilities' lead so soon to friction, deadlock and
433 breakdown? Surely one basic fact remains. In 1917–18, when Leverhulme framed his policy and made his plans,
228 the Scottish fisheries, to judge from pre-war years, could still expect to hold high place in providing for a brisk
•435 market in herring and white fish. True, the value of the Island cure of white fish had fallen from £100,000 in 1900 to one-tenth, £10,000, in 1913; but Leverhulme saw that since fresh fish were now demanded, his capitalisation of equipment with accelerated transit of the catch should bring quick recovery. The herring trade had been active at Stornoway up to the eve of the war; and although the Islanders had made leeway following the introduction of steam and of larger motor drifters, Leverhulme thought he saw an opportunity to capitalise the industry, providing 'work for wages'. This forecast was wrong. Consumption declined, and the market fell. Not only so; the proportion contributed by Scots fishermen to the shrinking market declined even more.

(c) House-building. From 1922 to 1949 the Department of
641 Agriculture advanced loans for the erection of 760 new houses
654 and the repair of 220 other houses. This, with the erection
746 or repair of 40 steadings, may be taken as the equivalent of
362 1000 houses in the 20 years of peace, of which three-fourths were new. Rural building was at its height in the early 'thirties,
356 but 1938 was a typical year. Taking the value of each house as £600 and subtracting half for imported materials, we may assume that for 50 houses built that year the labour given
431 produced an output of £15,000. In addition, some house-
362 building and repair was done without State aid, for which a
356 guess of £15,000 may be made. Such sums may not appear large, but they correspond to the enduring fulfilment of a prime
•435 need, a 'real wage', of importance when compared to rents and costs elsewhere. Of the expenditure on house-building in Stornoway burgh during 1938, the value may be assessed as £10,000, of which £9000 was for Local Authority housing. Most of the total was produced by local labour.

(iii) *Fishing Industry—Net Output and Earnings*

434 (a) For 1938 the total catches, prices and quantities of
fresh cured fish landed in Stornoway District show a value of
228 nearly £100,000 (£98,000) for the herring catch, and of £162,400 for the cured herring. Our problem is to estimate what fraction of these sums may be included in the net output of the Island
127 industry proper. The Fishery Board's *Statistical Tables* and *Annual Report* extract the produce brought in by local boats from the total, separating it from that due to 'strangers', and so permitting a fairly reliable estimate, checked by local enquiry.

228 Of the herring taken, nearly 80 per cent were caught in the
summer fishing, June to August (*Annual Report*, p. 13). The
501 week of maximum local activity in herring fishing for Stornoway District may be taken to be characteristic of this pre-war period (Table 8). There were then 111 steam-boats engaged; and as only five were locally registered (at Stornoway itself), the remaining 106 were strangers. There were also 66 motor-boats engaged and though 81 motor herring-boats are locally

APPENDIX II

198 300 houses, with nearly 30 built by "private enterprise"; in
362 addition the Local Authorities built 140 in the immediate
647 'suburbs' (of which 50 were temporary), a total of over 470
63 and an average of, say, 47. Another 115 were built in the rural
•438 townships. If we give a round total of £125,000 as the value

	Barvas	Lochs	Stornoway	Uig	Lewis Total	Harris

Tractors	24	4	24	5	57	8

198 for an average year (such as 1953) for Local Authority Housing,
362 we may allot half this to net output of local materials and to
647 wages earned by Lewismen, some £65,000, of which rural
63 wages were a small fraction, say £20,000.

435 For crofters and cottars, however, in 1953, a fairly typical year, there was much local effort and achievement, by help of 180 loans and grants from the Department of Agriculture
434 for Scotland, totalling £81,000 for new houses or house im-
647 provements (with a very few steadings). £80,000 may be allotted to local materials and to labour paid or given by house-
654 holders themselves.

COMMUNICATIONS

491 and footpaths. Until this time, the greater part of the district of
653 Park was accessible only on foot. Roads were 'at best rough nar-
*175 row paths where rushes and grass grew between the tracks'. The Act improved the old *frith-rathad* (rough tracks) to such an extent that, says a report of 1902, 'a marked improvement has taken place in school attendance by their formation'. The opening up of the island certainly benefited the people. Though the moor tracks
491 might give a more direct route to Stornoway, the roads at least
493 offered a hard surface for horse-drawn cars and carts. The num-
bers of vehicles accordingly rose, and for long after the turn of
*175 the century the horse enjoyed a monopoly. Motor cars were beginning to be read about in the days-late newspapers brought to the island, but not until 1917 were the first complaints heard about cars tearing up the surfaces of the roads. Slowly but surely the inevitable pioneers emerged with their 'tin lizzies'. By 1925 there were an estimated 250 vehicles in Lewis—and traffic congestion was beginning to be a problem. The relative speed of cars was still something to be wondered at too: it was progress indeed to be able to travel from Ness to Stornoway and back again between a late breakfast and an early tea. But for all this progress,
[435] one could still buy a good dog-cart in excellent condition, to seat six people, for £9. A two-seater trap could be had for £6 10s; a set of harness cost 30s. And as for fuel—the best quality oats were 10s 6d per cwt. Indeed, it was not until 1943 that Stornoway Town Council sold its last horse—and only because no one could be found to look after it.

When Sir James Matheson came to Lewis in 1844 there was only one horse-drawn vehicle on the whole island. By 1872 eighty-seven wheeled vehicles were using his new roads. A pioneer of the wheel-carriage service, D. K. Henderson, began business in the
[205] 1850s. He was the first to carry mails and held a contract for the Stornoway to Tarbert run until the GPO introduced its own vehicles. As the motor took hold Henderson changed over and was the first to establish a motor-transport business on the island. Not all the local vehicles were of recognised makers' designs. A writer in the *Stornoway Gazette* in the mid-twenties commented on the fact that only the engine and the chassis of the local buses were imported. Bodies were then erected by carpenters . . . and

AGRICULTURE AND FISHING

228 off all their debts) much hard work was called for, as well as skill
452 in locating herring shoals. The seasonal migration of herring is
*175 still a puzzle to marine biologists; it contributed to many a Lewis fisherman drawing a blank, to his ruin, while his neighbour came home flushed with success.

228 The financial values of the fishings of the island, particularly Lewis, are some index to its fluctuating prosperity. In a *Guide*
*175 *for Scotland*, intending visitors to Stornoway were told that the
• 435 annual figures for herring exports were, in 1860, some £60,000; for cod and ling, £13,600; smoked haddocks were valued at £1,600; lobsters at £1,396. Herrings caught in Harris and Lewis in 1889 were valued at £57,071. Two years later, the figure was £90,738, but after that year it steadily declined to reach a little over £20,000 in 1894. Increasing again, the catch in 1898 was valued at £128,707. There was a subsequent decline, picking up a little at irregular intervals, which continued until the effective demise of the industry just before the second world war, that is so far as Lewis was concerned. These catches of valuable herrings were not made solely by Lewis boats; the catches of many stranger boats, from the east of Scotland, must also be taken into account, to leave about 20 per cent as direct return to the island.

In 1938, the total catches of herring amounted to £98,000 for fresh fish and £162,400 for cured herring. This catch was obtained by 111 steam-drifters, five of which were locally registered at Stornoway, and some motor-boats, of which one-third were strangers. Harris has never been particularly prominent in the herring-fishing industry; shell fishing has been more profitable. In the years just before 1900, the average annual value of shell-fish caught in Harris was £2,306, only £500 below the Lewis figure. The Harris proportion of the aggregate herring and white-fish returns in the same period was just over £17,000, compared with the Lewis figure of £1,137,000.

Since the second war

228 Just before the second world war, Stornoway Fishery District
*175 furnished some 10 per cent of the Scottish cure of herrings, which
[433] averaged well over half a million barrels in 1937 and 1938, valued
[435] at about £1,500,000. Of demersal (sea-bottom) fish, the District

AGRICULTURE AND FISHING

subsequently despatching them to various dealers in the south. The local trawlers catch white fish and prawns with the same gear, but whereas most of the prawns are landed locally the white fish goes to Gairloch on the mainland for transportation to the Aberdeen market. Attempts have been made to overcome the distance between the island and good-paying markets: in 1966, by collaboration between Stornoway fishermen and the London Fish Merchants' Association, a consignment of 200 boxes of fish was sent direct from Stornoway to Billingsgate, bypassing Aberdeen. The fish was first frozen, then taken by SS *Clansman* to Mallaig railhead and thence to London by rail. It arrived twenty-six hours after leaving Stornoway, in ample time to catch the day's customers. The experiment is to be repeated at intervals. On occasions in the past, shellfish such as lobsters have been flown to Continental markets.

Lobster and crab fishing is an important part-time occupation in the island. In the past it tended to be rendered uneconomic by the heavy losses (sometimes up to 25 per cent) during transit between Stornoway and Billingsgate, but storage-ponds now help retain a reserve for market demands: a lobster-pond at Stockinish in Harris can hold about 25,000 fish, and the pond at Bernera, Loch Roag, can take 30,000. Marketing is done by an agency on behalf of the fishermen, the value per annum being around £50,000 for lobsters caught in the Stornoway Fishery District, and some £40,000 for prawns. The value of white fish is about £30,000 and of herring about £35,000.

TRADE AND INDUSTRY

land; his MS is in the British Museum. Lewis is described as being let by Mr MacKenzie of Seaforth for £1,200, which works out at about ½d per acre. The following list of prices of commodities indicates the main produce of the island:

The best driving cows at a medium each	£1	6	0
The Lewes stone of butter (23lb English) per stone	0	7	0
The stone of cheese	0	2	6
The stone of washed wool	0	9	0
The grass of a cow for a whole summer	0	1	8
Kelp, per ton	3	5	0
Aqua Vitae, per Anchor (26 Scotch pints)	1	5	0
Dog-fish oil (per barrel)	2	5	0
Herrings, per barrel	1	2	0
Salmon, per barrel	1	16	0
Dried ling, per hundred	3	15	0

The exports were listed as follows:

700 black cattle; about 100 are sold to ye shipping that put in at Stornoway, and 300 are sent, salted, to ports on the Clyde. The value of the whole is about	£1,430	0	0
Last year about 150 ton of kelp was made and exported	162	5	0
There are twelve stills in Lewes and from these was exported 200 Anchors of Aqua Vitae	250	0	0
Dog-fish oil, 140 barrels	315	0	0
Dried ling, 17,000	637	10	0
Herrings, 750 barrels	1,575	0	0
Salmon, 48 barrels	86	0	0
The spinning school at Stornoway from October 1763 to December 1764 produced 2,288 spindles of linen yarn	228	16	0

Also exported were dried cod, mud cod, above 2,000 sheep skins with wool on them, and some 38 stones of feathers. 'The Lewes neither imports nor exports grain', but mackerel was also an item of export: 'The fishers on the west coast of the island cure a great deal, which are barrelled and sent to the West Indies. The only article of woolen manufacture that the people of Lewes pursue is some coarse blanketing which they send to the Clyde,

491 [494] Brenish, at the end of the tarred road which also serves Islivig, is forty miles from Stornoway. On the thrice weekly bus the return fare to Stornoway was £1, and freight cost half-a-crown for a hundredweight, but because of competition from privately owned vans the bus service ceased in 1960. Mangersta is reached from the same road by about a mile of untarred side-road of indifferent quality; formerly the only access to it was by a footpath over the sands to the south. General merchandise, fish and meat are supplied [366] [205] [453] by weekly vans; there are no shops. There is a post-office at Islivig; banking facilities are supplied by a mobile bank.

311 427 The majority of the crofts are long narrow strips, with those in Mangersta being somewhat more compact. The area ranges from two to nine acres, with an average of about four acres; in Brenish and Islivick only about half is usually arable. All the crofts - or croft-units - are fenced, the work having been completed in Brenish in 1959. There are twenty-nine crofts in the rental for Brenish, ten for Islivick and thirteen for Mangersta; but, owing to amalgamations of various kinds the number of operative units is considerably less - fourteen in Brenish, five in Islivick and ten in Mangersta. There are no cottars.

134 407 [231] As soils are reasonably good and comparatively free from rocky outcrops, the arable patches are large enough to be cultivated with a horse or tractor. There is a tractor in Brenish, and four horses, a horse in Mangersta and two in Islivick. All of these are hired for ploughing and carting peats. Very little work is done with the spade, unlike many of the other Uig townships.

233 While the general rhythm of township work through the year is similar to other areas, here the sheep are wintered up on the hills; some crofters winter lambs on their crofts. Brenish crofters are allowed to winter eight sheep, (or sixteen hogge, or four year-old heifers), on Mealasta Island - hogge are usually sent since their loss, by falling over the cliffs, is less serious than the loss of heifers. Eilean Molach is used by Mangersta crofters, who are allowed two sheep each in summer.

241 The only crops grown are potatoes and oats, with "black oats" (Avena strigosa) on the sandy soils in Mangersta. Since seed for "black oats" is unobtainable commercially, the crofters save their own. A grass mixture is sown by the majority of crofters for hay, to qualify for the subsidy.

233 The extensive hill and mountain pastures are not separately fenced; sheep from all three townships graze over all. If the total sheep stock of the townships (about 3,300) is compared with the souming figures it is found to exceed the soum by about 50%. On the other hand, fewer cattle and horses are kept than formerly so that taking the total stock for all animals (horses, cattle and sheep) and comparing with the actual stock now carried, the area carries only 87% of the stock which the soum allowed. In the two older townships the souming was reckoned according to rent, being one cow, one two-year old and eight sheep for each £1. In Mangersta, however, the soum was one horse, three cows, one heifer, two stirks and twenty-five sheep for each croft.

Lambing percentage is about 80, and ewes form about 60% of the total sheep numbers [236] [435] (excluding lambs). In this district some wedders are kept for three years and then sold for meat, but the main income is from wool, about three pounds weight from each sheep, which sells at up to four shillings a pound.

231 Most crofters keep one or two cows, and the calves are normally sold in the autumn or spring sales. Brenish and Mangersta each have a bull, and in the three townships there are sixty-seven cattle and thirty calves. Shielings, formerly used for about seven weeks in

221 233 Since so much of the year is spent either upon or near the crofts it is but to be expected that greatest losses of island sheep will take place in the summer when they are far from supervision upon the hills; this contrasts with the mainland Highlands where heaviest losses, apart from those due to sudden snow falls, generally come about lambing time, when this takes place upon the hill, or soon after, in cases when the ewes and lambs are put to the hill too soon. On Bernera Shore on the other hand losses are heaviest on the hill in winter. Losses are extremely uneven in their incidence in time and from croft to croft. The cause of loss varies; there are no serious endemic diseases now, and there are few coastal cliffs - a frequent cause of loss in other places. There are however some boggy areas in the interior and some rugged; whether or not there are losses due to vermin particularly eagles, is a debatable point. Probably the fundamental cause of loss is lack of shepherding and adequate day-to-day oversight upon the hill.

233 There are certain special pastures that show interesting features. The Flannan Islands have excellent pasture, especially for the poorer male shearlings which need bringing on. There is all-the-year-round grazing for fifty sheep, which is shared by two crofters in Crulivig and one in Earshader. Unfortunately, the difficulty of getting a boat to go across has meant that for the last two years no visits have been made, and, after one or two years unattended, the animals become quite wild. Since 1949, when the Croir tenants were first permitted to cut peat upon the Bernera shielings, they have ceased to do so on Vacasay Island, where they now each send two sheep for summer grazing. They also send one sheep each to Euglam Island from 15th May to 16th August. One croft in Tobson includes certain small islands:

Bearasay Island (16.4 acres; soumed for 12 sheep per annum)

Eilean Fir Crothair (4.6 acres; soumed for 5 sheep per annum)

Seildeim (1.0 acres; soumed for 3 wedders per summer)

Similarly, Valasay (part of Tobson), has Eilean Liongain Valasay which provides summer pasture for two young cattle beasts or five sheep (one per croft). One crofter in Crulivig has a small offshore island taking two hogge during tupping and at least one crofter in Crulivig also grazing on Ben Sgurain, but there has been no success in the attempts to heft stock there. It is distant and unfenced; losses can be heavy.

231 Lewis is a very restricted market for livestock: the general practice in the Bernera area is to sell cast ewes at five or six or even more years to the butchers in Stornoway. Lambs may be sold on occasion, but generally they are kept either for replacement or for sale as three-year wedders.* The losses which occur, plus a certain amount of slaughter for domestic use, prevent long-term accumulation, though periodic fluctuations may be severe. Occasionally when there is a surplus of summer grazing, the Bernera Shore townships may buy in lambs from the western coast of Lewis, carefully eschewing those raised on the machair lands, which are said to be too "soft" for the hills. These are reckoned a gamble, they may or may not "take". The practice may be compared with that of the former Linshader Farm where, to take up the summer surplus of feed, young cattle were bought from the crofters.

236 [288] [434] The wool from the Lewis Blackface sheep generally varies from three to four lbs. per fleece. There is no longer any hand spinning; most wool is either sold outright or sent to the mills for spinning and dyeing. This practice is of long-standing. Even before the Great War, when the rent formed by far the most important item in the monetary affairs of the croft, the wool was either sold outright or, more commonly, sent to the mills for spinning and then taken to a weaver; the tweed was then sold either locally or to a merchant in Stornoway, the proceeds being used for the rent and other items.

231 178 Cattle, as has been pointed out, have declined greatly in relative importance since 1883: they are fewer in number - though far better in quality - and consequently subject

[435] *Three-year wedders in good condition fetch about £6 for slaughter. Carcase weight is about 44/45 lbs., sometimes as little as 38 and sometimes as much as 55 lbs.

464 his little spare time. In addition there are a few croft holders with periodic employment. It is noteworthy that the incidence of employment bears no direct relationship to the size of croft holding - there is not, for example, a preponderance of holders of small crofts taking permanent employment.*

162 464 However, the croft holders are not the only source of labour. Appendix C(4) shows that there is a total force of fairly regular labour for the crofts amounting to 147, or rather less than half the total resident population. Of these, 78 undertake regular employment, 24 have employment on occasion, and thus only 45 are full-time, of whom 25 are over 65. The forms of employment are indicated on Appendix D(2); weaving, with 49 persons regularly involved, is by far the most important single source of full-time employment, the only other being fishing (24 persons). Estate work (mostly gamekeepers, ghillies, etc. at Grimersta Lodge) gives regular employment to ten persons in the townships of the Shore. No other form of employment accounts for more than three residents between 15 and 65 years of age; the category 'casual' covers a variety of unskilled labour and there are five non-employable invalids.

288 283 About 50 households, out of 130, have looms. Yarn is distributed by the Stornoway producers for weaving on commission; they collect, finish, and market the cloth. Hand spinning has all but died out and such yarn is more likely to be used for handknitting than for weaving; at least one lady supplements her income in this way. There is some evidence that Bernera weavers receive less work than those more accessible to Stornoway; the reason for this may lie partly in individual contacts between weavers and producers, and partly in the particular skills of particular weavers but transport is an important factor. Such a small isolated group of weavers does not justify frequent journeys by the Stornoway vans; in fact most yarn is put out, and tweeds collected, by a weekly carrier.

1956	25	26	£4,949

Source: Scottish Sea Fisheries Statistical Tables.

Note: Not all the boats returned were necessarily engaged in regular fishing. Nor is the value of the catch shown necessarily attributable entirely to Bernera.

* Editorial Note: this is an inevitable result of the rigid structure of crofter land holdings. See Part I, page 30 and table 12. The age of the crofter, and his family circumstances are decisive.

233 Little close attention is paid to shepherding though several crofters profess to lik it. The great losses on the moor (often amounting to one third of the lambs each year) does not seem to cause much worry. The chief income from the sheep is the fleece whi sells at up to 4/- per pound, an average fleece weighing from three to four pounds. Th wool is not used for the tweed industry since it is too coarse being more suited to carpet manufacture. Appendix C (6) shows that the majority of flocks are small averaging fro 10-20. The overgrazing is the result of a smaller number of owners keeping larger flo Thirteen of the working units have between 50 and 100 sheep. As to those without sheep several crofters declared themselves to be too old to bother with them, a fact which ser as an illustration and introduction to the population problems.

435 288

162 Appendices D (1) shows the twofold nature of the difficulties which confront the comm Twenty-two per cent of the residents are over 65 years of age and no less than 56% are over 45 years old. With the sole exception of one man who works on the power develop 464 ment project at Gisla in South Uig, the main focus of employment is local. A small nu 434 of people are engaged in services to the community including shopkeeping, but the main source of income is weaving since crofting itself (by definition in this area at least) does not yield sufficient to maintain a family. Yet there are 31 full time crofters who are be supported in some other way, either by relations temporarily or permanently absent or interest on capital accumulated during periods of employment away from the island.

162 464 There is an insufficiency of women of child-bearing age to offer hope of an increase the population or even a sufficient number to guarantee a level of replacement. This fa together with the emphasis on one form of employment gives rise to anxiety among the crofters, who recollect what happened when the fishing finally collapsed during the Firs World War after a period of steady decline. In 1913 twenty boats sailed from Carloway and gave employment to 295 men. If the weaving fails (at present a weaver making thr 435 tweeds per week can earn up to £16 for them) there will be similar hardship and the net emigration from an area already none too attractive to young people will certainly becom more marked than it is at present.

Appendix C

Balance Sheet of a Croft

"The Muillear" has one croft and a two-acre buaile. In 1970 he planted one-eighth of an acre with three bags of potatoes, two of which he bought for L14/16, and harvested 22 hundredweights. This was sufficient for his family's needs and provided some feed for his livestock for all but two months of the year. A small plot is planted with cabbages, for domestic consumption.

Seven-eighths of an acre is planted with oats; one-and-a-half acres with grass and hay; and two acres are used for rough grazing.

The Muillear is interested in new ideas and techniques. He goes to meetings and discussion groups sponsored by the North of Scotland College of Agriculture, and has bought prize rams from the mainland to improve his flock. He tries to raise a few sheep using techniques of good husbandr rather than a large flock which would be given less effective care. He is teased by other crofters for "overfeeding," and for keeping his sheep on the croft and the township reseeding rather than out on the moor. "His sheep get homesick when they get out of sight of the croft." He wins the prizes at the Carloway Cattle Show each year, in a

Net cash income or profit from the croft thus represents 9% to 10% of his gross earnings from weaving. If computed as cash, uncalculated income from the croft in the forms of garden vegetables and milk products would raise the croft income by L30 to L40. In those households that consume their own sheep, the croft contributes an even greater amount.

[Dr-vtr] [Emgr-vtr]

beds are now covered by sphagnum moss and heather. Other hay-beds are permanently in natural hay, only thirty per cent of the land classified as 'old arable' is now in oats and potatoes. If natural hay is added, one hundred and thirteen acres of crops are taken from an area greater than the so-called old arable; this suggests that the cultivated area was pushed beyond the limits of the old arable (ninety acres) after 1845-52. As in all the fishing townships the area of sown grass is infinitesimal few only four of the fifty-eight operative units actually sow grass. The wintering capacity of the crofts could be greatly increased by the general adoption of the practice of undersowing.

There are forty-three legal crofts in Gravir but nine are sub-let, in every case to relatives. All the crofts are taken up and there is evident pressure of population on the land. In addition to the crofts, there are a further ten cottars, and squatters and feuars, besides the fifteen legal Glengravir crofts (ten operative units) which have no share in the Gravir common. The common has been encroached on by several feus for Gravir is the functional centre of Park: the Free Church of Scotland and Manse, the doctor, one of the two district nurses and two of the missionaries (assistant ministers) are all located in Gravir.

Gravir and Glengravir then have fifty-eight legal crofts and fifty-six operative units. Less than half of the crofts with grazing rights are fully stocked and one quarter have under fifty-per cent of the stock, including five without any stock. The common pasture of 2,652 acres is in general of poor grazing quality, dominated by the less nutritive species of grass and poorly drained. In 1957, a ten acre plot was fenced and re-seeded: only twelve of the operative units participated in this reclamation work, and the age of the participants ranged between 27 and 58 years; this is significant as aged tenants are unable to carry out such work. This scheme could be extended annually; if potential improvements to the crofts are limited, pasture amelioration is virtually without limits. Re-seeding on a large scale would enable better stock to be kept rather than greater numbers: at present the sheep stock is over two hundred per cent of the sheep norm, and a ewe and lamb sell for as little as £2 10s to £3 10s, an indication of the consequences of over-stocking. The cattle stock is below the stinting and the paucity of cattle is one of the notable changes in the agriculture since the 1930's for at that time as many as six cattle were kept on the larger crofts. The total stock kept in Gravir and Glengravir exceeds the stinting by thirty-five per cent.

The great majority of the crofts can certainly not be considered economic units. Judging from the stinting of one cow and follower and eight sheep per pound sterling of rent in a township where only seven crofts pay more than £2 rent, they were never intended to be self-supporting agricultural units. The produce of two cows and sixteen sheep, with potatoes, and in former days, here or nate, locally milled by the three Gravir water mills, could scarcely ever have maintained a family.

Fishing was the complementary economic activity, and in 1901 no fewer than nineteen boats and eighty-nine fishermen were registered at Gravir. Today, only one boat fishes commercially for lobsters.

If agriculture is singularly unrewarding, weaving occupies six of the males of insurable age and service occupations a further ten males and five females, but neither weaving nor service occupations are sufficiently available or attractive to keep the insurable population in the district. Twelve of the males between fifteen and sixty-four years take seasonal employment and forty-six are in permanent employment forth of Lewis, in all sixty per cent of the potential male resident population.

The economic problem of Gravir, in common with the other 'fishing' townships, became acute after the fishing industry collapsed after 1914; in the bay-day of the fishing most of the men fished all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a man might make as much as £90 in a good year or as little as £5 in a poor year. Apart from the ease of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted the bulk of the croft income. Today, on the basis of the weaving, the income of the largest croft including subsidies could only be approximately £150 excluding the amount to be set aside for home consumption of potatoes and milk.

[Emgr-vtr] [Gr-vtr]

The West Highland Survey Township Card describes Lemreway as 'predominantly a fishing and weaving village'. The measure of its old curing station are visible today and until 1947 there were twelve boats operating from Lemreway. A declining market, increasing cost of petrol for obsolescent boats and the lack of a landing stage led to the decline of the industry in this township. Today there is one fishing boat which lands its catch in Stornoway working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

The population with a declining population statistic proves interesting, especially when compared with those for Grimsay. Lemreway's resident population of just over 70 males and 70 females is large considering that there are six occupied crofts. Eleven of the crofts have more than one house and the other population forms over a third of the total residents. More than two-thirds of the resident population is in the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other crofting townships in Park.

Fourteen of these men are full-time crofters, while nine others find work in ancillary occupations such as weaving and fishing. A further eight supplement their croft work with regular employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just over thirty people outside the township permanently, fourteen in the Merchant Navy and nine girls in domestic service, while a further nine engage in seasonal work.

Emigration from the township has continued steadily with forty people leaving since 1939. Nevertheless, Lemreway has a large proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions generally are good. Every house has electricity, but, with four exceptions, water has to be carried from springs and wells. Many of the present houses were built in 1904-05 and in 1934 and they are already nearly 50 years old. Some of the old houses remain, some being used as byres, and these were built either along the shore or up the slope in the shelter of the hills, where the water was near the surface. The peat moss springs. Today supplies of food, peat and even seaweed are brought by road.

Attention must be paid to the importance of the tourist trade in Lemreway with its most attractive situation and reasonable road connections. An approach has been made to the Scottish Youth Hostels Association and while a hostel/cafe could not greatly increase the income of the residents, they would stimulate interest in the area. Accommodation for summer visitors, other than relatives of the crofters, is difficult to find but it seems that at least three houses could be used.

It is possible to be optimistic about the future of Lemreway, as at the moment considerable enterprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling, is an example. It is the first tractor and could be put to good use in some parts of the township. The attempt to improve the common pasture and the new extensions to neatly painted houses all reflect a combined effort to improve conditions. The old economy of crofter-fisherman has now adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the contemporary employment combinations.

The pessimism and apathy noticed in many crofters is to be found in Lemreway but shows this is the expression of enterprise. If Lemreway can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

Orinsay is a small crofting township (statistics in the form of a lucrative) around the head of a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards of the shore on a narrow strip of level land, while the crofts extend from the shore to the moor.

The Director of the Crofting Survey was grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 241.

Recent trends also point to a decline in the numbers of sheep, although more are kept now than fifteen years ago. From 1942-51 the numbers were more than doubled (263-565). A great deal of this increase was due to the wartime demand for wool, but there have been a result of the war subsidy, but yet at least may be connected with the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have since fallen steadily. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of the year these sheep are grazed on the common pasture on the moor or on the eighteen acre island in the bay. In August, however, the lambs are gathered in for weaning and dipping; in November the gates are opened and all the sheep allowed to graze on the cleaner pasture within the croft boundaries. If necessary they are given fodder, but from the beginning of January they are encouraged to return to the moor. Although the gates are not 'officially' closed until May.

The total area of the common pasture exceeds 1,000 acres, but most of this consists of hummocky, waterlogged and moribund weaving and fishing. A further eight supplement their croft work with regular employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just over thirty people outside the township permanently, fourteen in the Merchant Navy and nine girls in domestic service, while a further nine engage in seasonal work.

No pigs or horses are to be found in the township and each crofter keeps very few hens, normally just sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold to the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

It can be appreciated that crofts of this size and quality can neither provide the crofter and his family with sufficient income, nor fully utilise the labour available in the croft. As a result, much work in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primarily a fishing township". Today the herring fishing has disappeared entirely and only one crofter still does a little inshore fishing, sending his catch direct to Billingsgate.

There are now 45 people resident in Orinsay but an examination of their ages reveals that less than half of them are between 15 and 64 years. Indeed there are only six resident males between these ages, and three of these spend at least part of their time working away from the township on the Eishken estate.

As there is neither a school, post office, shop nor garage in Orinsay, there is no resident occupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 64 are permanently away in the Merchant Navy, returning home only for holidays, while another third are seasonally away with the Stornoway fishing fleet, almost half of the females of similar age work in domestic service in Glasgow. It must be realized that most of these people working away assist their families at home, and that a large part of the croft income are made up of money sent home, together with pensions and other allowances. Emigration from Orinsay to other areas has continued steadily, twenty people leaving the township since the war.

On the whole, housing conditions are good, due to relatively recent construction. There is only one traditional black-house, and even this house has electricity; only one house is without it. Water supply is not so certain as well and spring are the only source. The township lacks a telephone and a shop, but is served by travelling vans. A good road, constructed within the last decade, connects Orinsay with Grantr; entering the township via the valley to the north-east, it serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles distant.

Like so many other crofting townships Orinsay, above all else, gives an impression of constriction. The self-same hills that provide shelter also restrict cultivation. The crux of the situation is that land, extremely marginalin character, is being worked by too many tenants on holdings too small to be economic. With three residents to every two acres of cultivated land, Orinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in the 'twenties'.

182

TABLE 2

ESTIMATED VALUE OF AGRICULTURAL PRODUCTION ON THE ISLE OF SKYE

Produce	Total Marketable Production[a]	Local Consumption[b] (Household & Croft)	Exports
Oats	£ 3,500	£ 3,500	£ ....
Potatoes	23,500	23,500	....
Turnips	2,000	2,000	....
Hay	24,000	24,000	....
Sheep and Lambs	70,000	20,000	50,000
Wool	50,000	10,000	40,000
Cattle	90,000	20,000	70,000
Milk	30,000	30,000	....
Poultry and Eggs	40,000	40,000	....
Pigs	6,000	....	6,000
Miscellaneous	5,000	5,000	....
Totals	£ 344,000	£ 178,000	£ 166,000

[a]Based upon assumed yields from crop acreages and stock reported to the Department of Agriculture for Scotland.

[b]Consumption includes an allowance for loss of stock.

436

436 MEDIUM OF EXCHANGE--articles circulating in exchange at their intrinsic value as standard money (e.g., salt, cattle, grain, shells, metal bars or coins); forms of representative money (e.g., warehouse receipts, certificates of deposit of standard money); credit money (e.g., government notes, bank notes); token money (e.g., subsidiary coins, shell money, bead money); coinage and mint; right of issuance; counterfeiting; etc. See also:

TRADE AND INDUSTRY

In the earliest times, the folk of the island of Harris and Lewis were self-supporting; all that they needed for life as it was lived in those days was available at near hand; their existence was self-contained, the economy virtually self-sufficient. By and large, the only commodities often imported were salt, iron, and, to a certain extent, wood. Rents were paid largely in kind: the produce of agriculture, fishing and labour. Surplus produce was directed to southern markets to bring in the odd shilling or two for which there was really very little need in the island. But once money became important in the national economy, it was not long before it was requested in the island economy. By 1700 the island was well before, two or three open boats set out each year from Uig to Glasgow, laden with salt beef and dried salt fish. At about this time, too, changes were making their slow appearance in the island way of life and living. Specialists were being required: smiths, tinkers, shipwrights, netmakers, boatbuilders, weavers, tailors and millers. Each of these craftsmen generally held some cornland, either individually or in shares, and also had some rights in the common ground of the township in which he lived.

CROFTER INDUSTRIES

From the pure crofter class there emerged the crofter-craftsmen. In Lochs, for instance, by the turn of the seventeenth century 80 per cent were registered as fishers and netmakers. In the west, in the parish of Barvas, some 70 per cent were also fishers, with kelp-making as a seasonal occupation. In Stornoway parish, where subtenants paid 30s to 60s in rent, with twelve days' service, they sold kelp to their tacksman at 5d each, earned 20s a month on herring boats, made kelp at 30s a ton, and worked on roads for 8d per day.

In Harris in 1895, the eight trained male weavers worked for the gentry only. Weaving for the populace was done by the

but their negligence even in ye article appears from their sending 439
out annual above 2000 of wool out of the country unmanufactur.' 175 *
Harris was rented at £600. Exports were some 100 tons of (427)
kelp (£325); and the value of 250 black cattle exported alive, with (436)
100 salted, was £445. Small quantities of cheese, wool, and the
skins of sheep, otters and seals were exported. Grain was neither
imported nor exported.

407
The plough, which is used here, and in most places of the long 175 *
island, is of a very peculiar construction. Its length is but 4 feet, (492)
7 inches, and is drawn by four horses abreast. It has but one
handle by which it is directed; the mold board is fastened with two
leather thongs, and the soke and coulter are bound together at
the point by a rim of iron. Beside kelp, there is little else manu- 195 *
factured, except a little coarse woolen yarn, and some blanket- 439
ing, which they send yearly to Glasgow. They raise a little flax, (286)
of which they make some coarse linen for their own use, but im- 248
port all the fine linen which they consume. In the year 1756, an (177)
American vessel in distress was obliged to put out three hogsheads
of linseed in Harris, which was sown and afforded crops of lint
which were above double the value of the usual crops. The east 228
and west of Loch Tarbert in the Harris are every year revisited 175 *
by the herring shoals. During the five years from 1743 to 1747,
the west loch was the principal seat of the herring fishery. About
thirty vessels from 18 to 40 tons, belonging to Campbelltown,
Greenock, and Irvine, were completely loaded each of these years
at this place.

443
With even a modest amount of business taking place, it was a 175 *
natural step to establish commercial facilities. Stornoway men who (453)
once acted as agents became shopkeepers. The increase in the use 436 *
of money attracted banks. During the Seaforth ownership of 175 *
Lewis, the island had its own currency or notes, designed and
printed from plates in the same style as the modern banknote. The
wording ran: 'I promise to pay on demand to the Chamberlain
of the Lewis or Bearer one pound Sterling at the Counting Room
here.' The notes carried a date and were signed by the proprietor,
J. A. Stewart MacKenzie. It is not known for certain how long
the notes remained in currency, when they ceased to be used, or
even whether they were officially acceptable. At one time, as rare (523)
items, they fetched high prices from collectors. A number were

436 *
* 175 found in a warehouse in Leith some years ago; a few found their way back to Stornoway, where one can be seen in the Public Library.

HARRIS TWEED

288 Today, with kelp long forgotten and fishing of minor importance,
(178) it is the Harris Tweed industry which supports many of the island people, either directly or indirectly; an island cottage industry with exports earnings exceeding £2,500,000 a year. Harris Tweed is exported to some thirty countries, including America, Canada, Australia, New Zealand, Japan and all the European nations. The industry is in fact the basis of prosperity in the area, both dependent upon and supporting the crofter-weaver working at the handloom in his home. Seven million yards of tweed are woven annually by the independent weavers 'on the looms' of the various mills. The weavers must finance themselves, buying their own looms and bobbins, equipping and maintaining their workshops. Though they receive their supplies of yarn from the mills, they are graded as self-employed persons and as such are not entitled to unemployment benefit—a subject which has caused much argument.

286 One of the most outstanding facts about the cloth is that its essential qualities have remained unchanged since the industry's early formative years. But it has astonishing versatility and over 5,000 patterns are available, including the crotal browns and the heather colours.

288 A weaver on average can produce about 2½ webs, or tweeds,
286 a week; a web measuring about 80 yd by 28½ in, and gets a
(465) reward of some £8 per web, according to the intricacies of the
(463) design or the number of colours involved. The money is paid out by a mobile bank making the rounds of the townships throughout the island. It is reckoned that the mills, for their part, make 1d to 6d a yard profit, depending on turnover; the total annual value of the industry's output is in the region of £4,000,000.

Between them, the five mills in Stornoway and the one in
(234) Shawhost consume two-thirds of the Scottish wool clip—the native Western Islands' crop is sufficient for less than a month's production. A thousand pounds of raw wool end up as 885 yards of finished cloth.

800 tons and had a steam-driven winch. The slip has also 336
vanished—except for the name of the Patent Slip Wool Mills, 175 *
which produce Harris Tweed.

Other small industrial activities in the island during the nine- 195 *
teenth century included the business of Alexander MacPherson, 204
chemist, druggist, stationer and printer, who set up in Stornoway in 1842. He brought across the Minch with him Lewis's first demy-size hand printing press, which was still in use on 1 January 1889 to produce the first issue of the short-lived *The Lewisman*. Copies of this earliest Lewis newspaper can be seen at Stornoway Public Library. Early in the 1890s Thomas Nicolson also set up as a printer.

Whisky was once an important product, not only for local 273
consumption, but also for export. One of the Privy Council's 204
main indictments against the islanders in the Hebrides in 1622 175 *
was that they seized any cargo of wine and spent 'both days and (439)
nights in their excesse of drinking'. The council therefore enacted that masters of vessels sailing Hebridean waters should carry no more wines. It has been suggested that this and other measures were responsible for the beginning of illicit distilling, which in Lewis continued overtly as late as 1827. One of the two principal stills established by Lord Seaforth in the island at that time was at Coll, a few miles from Stornoway, the other at Gress, a few miles farther on. Such was the fame of these stills, both for output and quality, that it was hard to choose between 'Coll' or 'Gress'. Sometimes, the product passed as an article of exchange 436 *
in the island, and the factor received a considerable part of the (420)
rents in it instead of money; but the stills were closed about 1870.
The *Inverness Courier* of 14 November 1867 reports virtuously:
'Owing to the vigilance of Captain Oliver, of the Revenue cutter (439)
"Prince of Wales", and the new Excise Officers on shore, smuggling is so completely put down in the Long Island that there is actually not a drop of illicit whisky to be got from the Butt of Lewis to Barra Head; and there is probably at this moment a larger supply of legal whisky from Greenock for the supply of Stornoway alone, than was ever imported into the Hebrides before.'

and to show their friends at home, that they had braved the 484
hazardous Atlantic seas to visit St Kilda on the very edge of the 36
world. The tourists were charitable, but this brought a psychic 175 *
logical evil in its wake. In 1886, Robert Connel wrote: 'One (155)
cannot be long on the island without discovering the great moral injury that tourists and sentimentalists and yachtsmen, with pocketful of money, are working upon a kindly and simple people.' It was estimated that the islanders collectively derived a (434)
profit of 5s from each of the 200 or more tourists who arrived during the short summer.

The new influx of cash into a community which required 436 *
money as an exchange commodity because the original native 178
production was barter, encouraged a relaxation of effort (232)
to be self-supporting. The numbers of seabirds slaughtered (264)
steadily fell; paraffin oil replaced the traditional bird oil in St (461)
Kildan lamps. The need for daily work, to toil in fellowship with others, was dissipated; the islanders could purchase most of the food they required, provided communications with the mainland were maintained. The population was in any case dwindling, as (161)
St Kildans became more aware of 'the other life' available on the mainland of Britain.

Finally, on a misty summer's day in August 1930, at a cost to 166
the nation of little under £1,700, St Kilda was left to the care and keeping of the changeless Atlantic. It is now preserved by the National Trust for Scotland as a crumbling monument to a small human tragedy of a kind that has been repeated, and will be repeated, in other small communities who cannot argue out the case for their survival in terms of economic viability. The island (112)
is now occupied by military personnel in connection with the Hebridean rocket range on South Uist.

St Kildans were described by Dean Monro, in 1549, as 'simple, 175 *
poor folk, scarce learned in any religion'. In 1698, Martin Martin 181
published *A Late Voyage to St Kilda*. He went there in the company of a minister who had been summoned to the island to denounce a certain false prophet who had risen among the 180
inhabitants (pretending he was an emissary of St John the Baptist). Martin found, as did later visitors, that the island economy 436 *
and the quality of its life were closely dependent upon its birds, (325)

175 rent-rolls record something of more vital and enduring
241 concern, the unit of community life in the Lews. This was
427 the 'conjoint' or 'group' farm of the labouring peasantry
(476) —though it was overlaid in parts of the Island by the formation of tacks held by gentleman rent-farmers.

175 Both rolls are Judicial Rentals, that is to say, the
241 tenants, great and small, were convened by the Government Commissioners and examined on oath as to the rents
427 they formerly paid; the accounts were then entered and
(476) totalled. Because of the Jacobite resistance, the small
656 amounts of rent and the maladministration of the Forfeited Estates, doubt was cast upon the first rental, of 1718. A second rental was therefore compiled in 1726, upon a different system, which confirms the correctness of the first.[1] All were named, including those absent or 'valetudinary'.

175 Owing to the Island's comparatively smooth land sur-
361 face and access to the sea, the people could grow themselves
(182) as they chose. Whereas in the Highland mainland many
(184) a pocket of land is too small to keep more than two or three
(433) families alive and no fishing grounds are available, in Lewis
(476) the people could join together in teams of four, five or six, to work a hamlet-farm or penny-land; definable as a joint-farm of unit size, and to man a boat with "four row and one to steer".

175 The first point of interest is the equality of the shares,
241 each man paying exactly the same as his fellow-tenants for
427 his 'farthing',—a fourth, or other equal share of the farm.
(436) An average share of rent was a little over 10 shillings sterling
(113)

[1] A. Geddes, "Conjoint Tenants", etc., *Econ. Hist. Rev.*, Second Series, vol. i, no. 1, 1948, pp. 54-60. This reconciles the evidence of 1718, reproduced in the Brand Report (1902), Appx. O, and that of 1726, edited by J. R. N. Macphail (1914).

175 might be thought) in cured fish. Here is a sample Deposi-
241 tion from Borve (W. Lewis), a township then composed of
427 five hamlet-farms, or 'pennylands', with their share of
• 436 outrun, peats and fishing grounds over the whole and known as Five-Penny Borve.

Donald McGillimichaell, William McHomas, Gillichallum McCoilog, and John McConnell in five penny land of Borrow and Parish of Cladach afor[s] MAKE OATH severally that neither of them has any Tack of their possessions, But that each of them pay yearly to ye above Mr. Zachary McAuly for behoof of ye Countes [of Seaforth] for[s] Nyne Pounds Scots (*i.e.* 15/-sterling), Two Bolls one Lipie meall, Fifteen pound weight of Butter, and three-fourths of a mutton. Depone they and each of them are someqt in arrear but know not the Particullars, and this is ye truth as they and each of them shall answer to God, and depone they can't write.

(Signed) DAVID BETHUNE
(Sheriff Substitute of Ross).

175 The only point on which these good fellows must have
241 had to face qualms in 'answering to God' was their lapse
427 of memory as to 'Particullars of arrears'! None of the
451 222 small tenants could remember this! Although the
(412) Chamberlain or Factor, Zachary MacAulay, denied it, he
(413) may have exhorted or compelled payment of rent in order to forward it to the exiled 'Marquis'. Mainland rents were actually despatched to France from Leith in broad daylight under an armed guard of clansmen! At the same time, neither MacAulay nor the joint tenants were of Clan Kenneth, the MacKenzies. MacAulay himself was a man of high character—and a poet too—and not one to collect rents in order to embezzle them. His affirmation has the ring of truth, with little alloy. To the Government Commissioners he wrote that what made it impossible for Lewis peasant-fishers to have paid rent in full during civil war,

NEXT FICHE

attle are kept on 162 of the 219 units; in all there are 180 cows of three years and over, 47 cattle, and 110 calves. The usual practice is to suckle the calves, and sell them as soon y qualify for the calf subsidy; lack of winter-keep is one of the reasons for this practice. breeds of cattle are mainly Shorthorn and Aberdeen Angus with a few Highland cattle. The function of the cow is to provide milk for the household; households without a cow rely ly on tinned milk. Cattle are sold at the twice-yearly market held at Garyvard, but prices ate greatly. The townships of Park certainly do not carry a full souming of cattle.

heep are more important than cattle in the crofting economy in Park. The breed is the Blackface, a small, lighter type of the Scottish Blackface breed. The sheep are pastured common grazings in summer, and are grazed on the croft land in winter. The standard of husbandry is also low as few crofters dispose of cast ewes or have a defined breeding y as all stocks mingle freely on the commons. The lambing percentage for 1958 was about r cent and the number surviving in August compared to the total ewe stock was 52 per cent, was generally agreed that 1958 was a poor year. A further indication of the quality of heep is that in the fishing townships, a ewe fetches from 35 to 50 shillings, and a lamb 20 shillings locally. The low lambing percentage and poor prices can be partly ascribed lack of good grazing and to overgrazing, but disease and losses in a treacherous common re raise the mortality rate. In general the sheep are left to fend for themselves with a mum of shepherding although the more progressive crofters hand-feed the ewes and hogge in eather.

he majority of the crofters in Habost and Kershader, and a minority in Garyvard, rent addi- l grazing in Park Deer Forest, paying a fixed sum for each sheep. Sheep from these townships better prices; in the other townships a few weddera and fewer cast ewes are sold to the oway butchers. In many flocks, wool provides the only income from sheep.

is evident from Table II that the sheep souming is greatly exceeded. In the calculations, ewes aken as one unit, and 'other sheep', wedders and gimmers, have been calculated at half rate. is basis, the overall sheep souming is exceeded by 70 per cent and in only one township is tock comparable to the souming. Overstocking has been encouraged in crofting districts by we subsidy which was in operation till 1956 and it is notable that the rise in numbers of sheep rded in the Outer Isles coincided with the introduction of the Hill Sheep subsidy in 1938.[1]

stocking is without doubt the chief reason for the high mortality rate in sheep. Calculation of verall relation of the actual cattle and sheep stock to the soum shows that the common grazings rk are overstocked by 14 per cent. It is, however, impossible to calculate an exact figure, as umber of sheep grazed in Park Deer Forest was not enumerated. It is also evident from the idual croft surveys that the cottars, squatters and feuars, who have no rights of grazing, have equivalent to 157 cow units or 12 per cent of the total stocking. Thus the crofts of Park are taining an average stock fairly close to the souming, but the cattle-sheep ratio of 1:28 is too or proper management of the pastures.

n general, a low standard of husbandry obtains in Park but it is clear that the agricultural ships are much more efficiently operated than the fishing townships. Overstocking occurs in n of the twelve townships and sheep stocks are, with one exception, higher than the sheep souming

In Scotland as a whole, the number of sheep recorded declined from 8,007,134 in 1938 to 7,336,000 in 1955.

Types of ancillary employment

241 464 The question of the desirability of ancillary employment in a crofting district is often debated. On the one hand, engaging in such work means less time for croft work and makes wholehearted participation in the agricultural life of the township a virtual impossibility. On the other hand, crofters who take ancillary employment are better able to make capital investment in their croft. Table IV shows that in Park, croft efficiency, as expressed by the souming to actual stock ratio, is not necessarily related to participation in ancillary employment. If 000 the township is to be re-established as a working entity, a clearer dichotomy in the population seems desirable; those who wish to work the croft on a full-time basis might be given full use of the available land, and those who wish to earn their living in non-crofting employment could take out feu charters for their houses. It is clear that the agricultural resources of Park are insufficient to maintain the present number of crofts as viable economic units but the problem of finding industrial employment for any large non-crofting population is very great.

184 464 The Park Association, in their keen search to attract industry, met with little response for high freight rates and distance from markets made economic industrial costing well-nigh impossible. The Chairman of the Crofters' Commission has recently suggested that some of the Glasgow Overspill of "tradesmen and small businesses" might find "an opportunity to prosper in the West Highlands and Islands"[3] but even with Government grants for the establishment of small factories, it is clear that present freight charges would be a severe deterrent.

178 228 One possibility is that the fishing industry might be revived. In 1945, 16 large motor vessels were fishing from the townships between Cromore and Gravir; by 1952, three boats remained;[2] only one boat was still fishing in 1958. The recent Fishing Board Scheme guarantee, which provides a flat weekly rate for every boat turning out, brings hope as this [435] [452] guarantees a minimum livelihood. The major problem is the finding of the initial capital required to buy and fit out a modern boat, at present about £20,000. Eighty-five per cent of this sum can already be found in the form of grants and loans from the Herring Industry Board but the remaining fifteen per cent or £3,000 is often the more difficult sum to raise. The Murdo Macaulay (Rhodesia) Trust has offered assistance to a limited number of fishermen towards the raising of the £3,000", and this offer is a real opportunity. If fishing is not re-started soon in Park, few of the original fishermen will remain to instruct the new generation.

484 [312] Tourism is an industry hardly developed at all in Park. Lack of running water has made the householders shy to offer accommodation, but it should be remembered that there are city dwellers who are delighted to accept inexpensive accommodation away from the crowded resorts. Dr. Stig Jaatinen, in his "Human Geography of the Outer Hebrides"[4], states that this fact has made the Aaland Islands prosperous, and believes that tourism on simple lines could be successfully developed in the Outer Hebrides. Tourism need not bring in its train the desecration of the Sabbath for people who are willing to journey far in search of a quiet holiday usually conform to local observances.

464 Unless new sources of employment are brought to Park, it is clear that ancillary employment must continue to be sought elsewhere. The higher 'spending standard' in industrial employment, and the opportunities to find entertainment in urban areas (tastes often resulting from experience during school days in Stornoway or National Service), militate against a large population of young people, but basically lack of employment and the uneconomic nature of the crofts are the real reasons for the high degree of temporary and permanent employment away from Park.

[113]

[Kershader]

241 311 [407] with heather and peat on the higher areas, hay is taken off 19.25 acres. Four acres, mainly for potatoes, are worked by spade but most of the cultivation is by tractor hired from Balallan or, in 1958, from Habost. Lazybede are common and in some cases are carefully renewed, but the present tendency, reaching its extreme in a field of about two acres on one croft, is towards the formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in 244 zones (a) and (b), with little development of (c) at present. The only crops are oats and potatoes, 246 with some garden plots of cabbages, turnips and carrots. The potato main crop is generally Kerr's Pink (Golden Wonder on one croft), with a couple of rows of Skerry Blue or Edzell Blue 198 for earlies. There is no memory of Black Oats (Avena strigosa), and bere (Hordeum vulgare) has certainly not been grown since 1930, and probably not since 1909. The oats are grown 256 exclusively for winter feed and are hand-threshed with stock and comb as the need arises; the 339 last water mill in the locality went out of use after 1914, the last handmill in 1916; no grain has been sent to Stornoway since about 1930. Rotations are extremely irregular: some lazybeds are still cultivated with alternate crops of oats and potatoes and have heavy seaware and manure fertilization, but most other arable areas have some sort of oats, potatoes, oats, sown 324 grass sequence. Fertilisers used are seaware and manure (ten crofts), manure (eleven crofts), 247 sand (one croft), lime (ten crofts) and artificials - 'Potato manure' and sulphate of ammonia - 247 on eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters' Agency.

231 407 232 The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The plough was first introduced in 1936. When a tractor from Balallan became available for hiring in 1953, the horses were disposed of. The present soums are by cow, young beast and sheep per croft in proportion to rents and range from 3 cows, 3 young beasts, 69 sheep down to 1 cow, 1 young beast and 23 sheep. Eight crofts exceed their entitlement but no croft hasless than half the souming and the deficiency is mainly in cattle, especially young beasts. On the other hand, no 234 operative unit is entirely without cattle as manure is extremely important. Cattle are kept for 432 domestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months 10 acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows 221 is developing:-

191 253 311

(a) As soon as the weather allows in May, the cows are put out in the park for about three weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new outer fence erected in 1957.

(c) Back to the re-seeded park for about five weeks.

(d) Return to the crofts for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

178 The young beasts spend much of their time on the outer common grazings. As most of the crofts, beginning with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced, the old arrangements for township commoning from 15th October to 10th May are now obsolescent. Another park was also fenced for general purposes and for weaning in 1957. Prices for calves 435 and cattle are very low and this discourages cattle breeding; on the other hand, lack of winter keep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the lambs, are cleared from the crofts for the tupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

[Kershader]

233 (b) From New Year to mid-April most sheep are kept on the common grazing. Practices,
311 however, are irregular; some flocks are usually hand fed, others only rarely. In the former
221 case they heft near the upper limit of their home croft and remain fairly close at hand.
231 Most crofters hand-feed their lambs, probably housing them at night, allowing them hay in the morning and turning them on to the common grazing in the evening. All this naturally depends on weather conditions.

(c) From mid-April to May, lambing takes place on home parks.

Most crofters let their ewes-with-lamb out at one date.

(d) At the end of June, gimmers and wedders are clipped.

(e) In mid-July the ewes are clipped.

(f) The lambs are weaned in the first and second weeks of August.

(g) The dipping takes place in October and the rams are brought on the crofts.

[432] There is no general sale time, sheep being sold or slaughtered at all seasons. There is no club stock, but all but one of the Kershader crofters, along with crofters from neighbouring townships, take full advantage of the arrangement, first established in 1941, to graze sheep at 2/- per sheep and 1/- per lamb in Park Deer Forest. Hence irregularities of rhythm are introduced or exaggerated.

231 Sheep are not particularly profitable: in general, wedder fleeces give 3½ to 4 lb, ewe fleeces
[256] about 3 lb, and the wool is sold to the Stornoway mills and to the Wool Marketing Board. Average
435 sheep carcase weight is reckoned to be 41 lb, and the price rarely rises above £3 and almost never above £4. Braxy and fluke are kept under by medicaments but remain potential dangers; 'Black leg' is still a serious problem. Many sheep are drowned in the bogs in Spring and late snows (1955, 1958) are disastrous for lambing.

241 Under-employment is a serious problem in Kershader. There are nine males classified as
161 full-time crofters, but probably only four of these (two on one croft) are in fact in this category,
162 and of the total of thirty males with their homes in Kershader, only fifteen of the insurable
167 population are permanently resident. There are twenty-eight females with their homes in this
166 township, but on only six crofts do any of twenty permanently resident females help with croft
464 work. Local ancillary employment consists of weaving, fishing (for domestic consumption
[463] only) and work on the roads. Boats, one with outboard motor, are owned by three crofts. The
[501] only resident professional worker is a nurse. Ancillary employment must be, and is, sought away from the township. As a result, of the 73 persons recorded as having migrated since 1939 or as being resident, periodically away and permanently away in 1958, 19 have left the area for good, 4 are permanently away, 8 periodically away, and only 43 are resident. Only one person has entered the township since 1939. The age structure of the population, too, is far from the
[705] optimum. The school in Kershader, which had 20 pupils in 1873, reached a peak of 110 in 1907
[708] and declined to 28 pupils in 1953, now has but 17, although it serves Caversta, Garyvard,
[871] Kershader and Habost. Maximum population was attained in 1881, but the total remained fairly constant till 1911, after which decline was marked. Since 1950 this decline has markedly increased.

132 It will thus be seen that the most serious problem facing Kershader is that of stabilizing the
241 population and giving it a stronger economic basis. Apart from the potential development of tourism, fishing, weaving and other home industries, the only possible occupation is in
[813] agriculture with perhaps a little forestry. Forestry, though important as shelter provision, cannot be a practical proposition in large blocks or on a large scale, as it would dislocate the

[Garyvard]

407 Only a fraction of the total arable land is cultivated by tractor and this is divided among seven crofts. In spite of an emphatic statement by one of these cultivators to the effect that he will never use it again, the use of the tractor will increase as soon as the pioneers are able to prove to their neighbours its capabilities and as soon as the lazy-beds are joined together, an improvement which has already taken place in Habost. The main objection to the use of the tractor by the disappointed user was the inevitable one that the yields were smaller than in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation,
242 for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two acres of common grazing land by the road on the west side of the township, by nine of the crofters working together during the evenings. The work began early in Spring when 6 tons of lime, 10 cwts. of mineral phosphates and 8 cwts. of compound fertilizer were spread evenly over the land. The grass seed was sown in July, the most favourable time for sowing since there is less danger of a drought than earlier in the year, and more convenient too, in that the sheep had been gathered for shearing and 250 of them were available to be driven back and forth over the land to tramp the seeds in. In theory this land should be ready for grazing next Spring, but in practice it will be ready in November. It is planned to re-seed twelve acres in all.

231 Most crofters have a cow to provide milk for their own needs. The Black Poll bull at Gravir
234 is preferred to the other township bulls since its progeny command higher prices. Sales are held
432 in the district twice per year, once on the old lake-level on the east side of the township, and once
435 at Balallan. Prices for calves are normally better in Spring than at the Autumn sale, nevertheless prices offered tend to be low. Even so, it is usually to the advantage of the crofter to part with the animal rather than bear the cost of taking it back to the croft and wintering it there. Naturally there is some bitterness that the middlemen who buy these animals will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but also at the local sales.

241 Crofting is not in itself a lucrative form of employment and in most households there is at
434 least one other source of income. A majority of the crofters have regular employment, two
463 working in quarries or on the roads for the County Council, another is postman, three are weavers,
464 another both weaver and contractor, while yet another works in Antarctic waters aboard a whaling
[288] factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the ancillary occupations, though the weavers are suffering at the moment from the slump in the Harris Tweed Industry which is also affecting the prices for wool. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

241 Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set to
226 catch mackerel and other demersal fish. There is not one large fishing boat, however, partly
501 because of the scarcity of fish near the coasts, and partly because of the isolation of the area and the subsequent difficulty in marketing. The Fleetwood trawlers are regarded as pirates in the
[228] Minch, and one has to its credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garyvard though it could be quite extensively practised.

361 The main road from South Lochs to Stornoway through the village has obviously had a profound
491 effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built, in favour of sites conveniently near to the road. The Road Age has greatly
[241] limited man's capacity for carrying goods. This is well illustrated by the fact that the majority of crofters in Garyvard use artificial fertilizers, whereas they are scarcely used at all in Caversta where the road ends about 50 yards from the nearest house.

[Marivig]

231 There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while
[935] all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

314 Peats cut on the common are transported by lorry to the crofts, while peats from the north end of
482 the peninsula separating Loch Marivig from the sea must be carried in creels.

228 Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft,
501 and with this supplements the family food supply. One herring boat, operating nightly from Stornoway and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobster during the winter and markets them in London.

463 Of the other crofters, only two supplement their incomes by weaving, one by working on the
464 roads while several men work partly on the crofts but are periodically away whaling in South Georgia
466 fishings, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual
168 migration from Marivig, especially of the young people, is reflected in the high average age of the
167 permanent residents, and in the numbers in the school - over one hundred pupils in 1900, thirty-nine
162 (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young
471 people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

205 The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a
206 shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There
466 is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road
494 which reached the township from the west in the late 1920's has a tarred surface and is much
495 better than the later road southwards to Gravir which is untarred. There is no church in Marivig
491 and most of the population attend the Free Church in Gravir.
446

Within the township the two arms of the township road serve all but two of the crofts and the
363 sites of the newer houses, few of them more than thirty years old, tend to be near the road, while
361 the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain
362 and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron.
377 All the crofts are supplied with electricity from the grid, but very few have a piped water supply;
312 rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

829 The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the
drift of population away from the crofts, but those who remain have little incentive to work the
900 crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

APPENDIX II

434 228 [439]

(iii) *Fishing Industry* (1953)

The renewed Russian contracts for herring have meant loading of Baltic shipping at Stornoway with barrels of herring cured both in Stornoway and Ullapool. Catching power in Scotland generally is hardly enough to meet this contract. Thus, while the numbers of boats continued to decline after the war, leaving only one steam and 33 motor drifters (over 30 feet keel) registered by 1953, the fishermen employed rose to 610, of whom some 520 were crofter-fishermen. Many worked much of the year; on the other hand, most of the winter catch went for 'oil and meal' at about 50s. per cran instead of the top price of over 80s. For local boats a figure of £30,000 is suggested for the catch of herring, say £10,000 for white fish, with £5560 for shellfish. For "curing and associated income" the pre-war figures may be doubled.

[178]

(iv) *Other Sources of Income earned in the Island* (1953)

434 465

In mid-1953, of just 5000 registered for the Island as employed—and other than the self-employed, *i.e.* the farmers and crofters, the hand-weavers and the boat-sharing fishers—1130 earned by the three industries first named, the rest by other trades and professions, 3870 in all. The unemployed numbered 1180. Analysis of wage-rates would throw light on total earnings. As to unemployment, the fact that, like crofters and many fishers, hand-weavers count as 'self-employed' means that when out of work they are not covered by unemployment insurance, and have to be helped, at low rates, by public assistance.

[657]

(v) *Allowances, etc.* (1953)

434 657 436 729

Turning now to Remittances, to the manifold categories of Pensions, National Insurance and National Assistance, and to Unemployment Benefit (a small item), the Table B, 1953–54, shows the totals kindly furnished for this study, with £1,017,110 for all Lewis and an estimated £977,010 for rural Lewis.

from these influences. Now the government provided the capital, by grant, subsidy, and loan, and the guidance necessary for a fuller utilization of the land. The crofters who had already seen their subsistence economy disappear became a part of the national system of commerce. What effect have these influences had on the culture? 175* 178* 184 241

Throughout the modern epoch there has been a tendency to increase the production of exports, first cattle and then sheep, at the expense of the traditional subsistence crops. Within ecological limits, the national markets have determined what the Sgiathanach might produce. Since the environment has made Skye a pastoral land and agriculture is a poor risk in the best of years, abandonment of a subsistence economy has meant dependence on stock breeding for export. Commercialization of the land and increasing dependence on imported food has resulted in a growth of the importance of money. The decline in household industries, caused by economic deterioration, has also played its part in the people's dependence on currency. As a measurement of values, however, the importance of money has declined since the period of the large sheep farms. The crofter's margin of profit is small, and his opportunities to earn a wage are limited. Economic differentiation no longer affects the traditional status values, except within the traditional polarity of landed gentry and tenant. 175* 178* 439 175* 178* 439 436 [55]

In a comparable way, the utilization of more efficient methods of production is less important now than it was during the period of the "Clearances." Techniques have improved for the majority in so far as labor saving devices are available, but the achieving of modern efficiency is precluded by the 175* 178* 427 241

241 the economy by subjecting many fertile acres to disuse because 427 of his infirmity. The other factor is the absentee tenant, 887 an individual who has obtained possession of a croft, normally 888 by inheritance, but who has failed to take up his inalienable 311 [128] rights of tenancy. Let us very briefly review the economic trends of the last fifty odd years and, then, try to assess the importance of the absent and the aged.

436 Although the Sgiathanach has refused to become a 433 specialist, fully involved in a money economy, he has become 241 increasingly dependent on the products of the wider commercial 178 439 society. Long ago he gave up growing the old staples, barley and oats. Not for many years has he grown enough potatoes or turnips to feed himself and his cattle. In place of these home grown subsistence crops, he now imports a great deal of his food. In an average year Skye imports over 700 tons of bread, 10 tons of vegetables, 300 tons of canned goods, 300 tons of potatoes, 500 tons of flour, and 100 tons of milk. To pay for these products, he exports cattle, once his only marketable produce, and an ever increasing number of sheep.

436 Hance, writing about the Outer Hebrides, sees the growing 241 tendency of the crofters to buy their food as indicative of an 233 increasing cash income.[16] 431 To a certain extent, this may be true. There are, however, additional factors involved. Ecological limitations have played their role. That the climate and soil together make Skye a grassland suitable for stock breeding rather than an island fit for cultivation is an often repeated

16. Hance, The Outer Hebrides in Relation to Highland Depopulation, p. 22.

436 belief. Since agriculture is a poor risk in the best of years, 241 the present tendency to use more and more of the land for grass 233 and hay can be regarded as a more complete adjustment to the 439 environment. The partial involvement in the outside contractual world encouraged and made possible the change. The same reasoning applies to stock production, including the declining number of horses, cattle, and, especially, dairy cows. The exports, obviously, reflect market demands. A couple of [243] crofters have unsuccessfully tried market gardening. The Sgiathanach is not a vegetable eater, and the commercial establishments, apparently, find a more dependable supply 436 elsewhere. A few crofters do sell potatoes in Portree, but 241 they will not compete with the large, east coast potato 432 farmer. In 1953, as soon as the price fell below the pre-season high, the crofters decided it was not worth the trouble 437 to dig the tubers for sale. The same held true for eggs. 436 Many crofters barter eggs with the food vans which serve the 235 rural areas for tea and meat. When the Scottish market was glutted in the summer of 1953, the crofters refused to trade at lower prices. They preferred to obtain their protein from the eggs, believing that the spring egg prices were the fair prices. For the sake of emphasis, I repeat, the involvement of the Sgiathanach in the world of commerce is only partial. Finally, in accounting for these changing economic trends, the aged and the absentee crofter must be taken into account.

887 The old people frequently cannot work their crofts or 241 cannot use them fully. The age at which the work becomes too

23 (234) People kept several cattle, some of which were dry most of the time. But because everyone was keeping cattle, (244) milk could be gotten from a neighbor. One man was (246) planting eight or nine hundredweights of potatoes before the war, some of which would be used to feed the livestock. 511 "You couldn't buy milk then, so you had to keep a cow. (234) And even though people were weaving, they weren't getting (231) so much money as they are now. It was the barter system (288) here for a long time. So they didn't have the money to (437) buy feeding stuff. It was better to spend the time planting potatoes. Now of course there's more money in the weaving."

175 After the war, an act was passed which provided free 272 milk for schoolchildren. Milk for the Shawbost school 234 was supplied by a farm ne r Stornoway, and villagers first 178 started buying the milk from the school milk van. A strike 175 held by weavers during the war had increased the payments 178 for weaving, and the barter system had stopped. More 288 (468) money was available. As the loom was more profitable, (437) more people stopped keeping cows, and relied on their (231) neighbors for milk, or got their milk from the van bringing (272) milk to the school. And as the cattle got fewer, the 178 market for bottled milk expanded. A dairy was started on 231 the west side of the island in the mid-1960's which carries 434 milk from Uig to Ness. 234

175 went away to the fishing, their families bought groceries 441 on credit. "If the merchant thought the fishing season 452 would be good, he let them have as much as they wanted; otherwise he restricted them in their buying."

288 The barter system continued in Shawbost long after 175 it stopped in Stornoway. A weaver was given credit in 159 Coinneach Rod's store, until it closed in 1948, for the 444 exact amount of the tweed. He never gave money. "You had 437 to get just the right amount of goods, even down to 472 tuppence in matches." People were forced to buy huge jars of jam which they did not really want or need. Some "cunning" fellows would slip a two-pound pair of shoes into a shoebox marked 15 shillings. "Coinneach Rod would ask if you wanted a wireless, or would a tweed jacket fit your son. You couldn't refuse, or you wouldn't do any weaving for him for a long time."

Coinneach Rod bought looms for many weavers, and they 288 would weave only for him to pay off the debt. "People 175 living on the dole with a large family would go to him 159 472 and ask him to buy them a loom. He would get the man a 452 loom, and then get him a lot of tweeds to weave so the man could pay him off. It was two tweeds for yourself and one for the loom."

288 2. Centralization and Specialization: Centralization 175 and specialization in handling the production of the tweed 441

181 621 People prefer to give money 103
178 in exchange for car rides or other help, including peat
437 cutting, because "than you're independent." Friendship
829 are still weak, relative to friendships in urban
572 settings. Most information which is shared between
62 (369) individuals rapidly enters the pool of communal gossip.
(521) Although many persons emphasize the importance of mutua
(476) aid in defining a friend, some emphasize the ability to confide and keep secrets.

621 Today many of the younger villagers do not know
178 their relatives to the extent that their elders did.
602 In one family, a girl who was about to get married had
(685) to ask her brother, who was the only one of the sibling
(576) interested in kinship connections, whom to invite to th wedding. It is still useful to retain an inventory of
602 one's relatives. "I have cousins in Glasgow and
484 Australia that I've never seen, but if I ever go there
(178) I'll have a place to stay." With the increase in transportation and income, more islanders are taking brief trips away from the island. During these trips, they almost always stay with relatives.

857 It is frequently said that children are now "cheek
572 less inclined to run errands and obey orders meekly, an
829 that they prefer to watch television or read books by
178 themselves to playing with each other.

CHAPTER IX

ECONOMIC CHANGES: 1750–1919

(A) TRANSITION: MIGRATION, FISHING AND KELP-MAKING

175 433 [621] [427] [794] [437] UNTIL the 'Forty-five the township had lived an almost self-contained life. Its traditional economy was self-sufficient except for two indispensable commodities—salt for the housewife and iron for the smith. Beyond this, the chief demand for payment was the rent to the lord, with tithes for the kirk. For these needs and demands a step towards production for exchange was required, the more so that what was exported might include the very necessities of life in 'bad years'. The rent was paid largely by the sale of a surplus steer or two, and 175 drovers called for the cattle. By 1790, if not before, two 317 or three open boats set out annually from Uig, for instance, for Glasgow, laden with salt beef and dried salt fish. 436 Although salt seems of little account today, it once bulked [435] large in the Budget, its price being heightened by duty, especially after 1707: "as dear as salt", was a saying, *cho* [251] *daor ris an t-salluinn*. Salt was needed to preserve the carcase of a 'cattle-beast' or sheep killed in autumn, and 175 for cod and herring curing. Wrecks were valuable, as on 433 all infertile undeveloped coastlands, both for their timber and their iron. Cairds or tinkers occasionally brought [326] metal goods; or a packman called, as strange a figure then [443]

boats; value, £15,400. Of this, the greater part came into Lewis creeks (Table 17), making £10,000 for Lewis.

Finally, we may add a round figure for whole or part-time occupations associated with the fisheries, including what accrues by the visiting fleet and its business, of, say, £20,000. This gives a total net output approaching £85,000 from fisheries for a typical year just before 1939.

We now turn to an estimate of the earnings of fishermen and of the women engaged in curing. To some extent these figures overlap, for the value of the net output includes the wages of fishermen and women; but the sums earned on 'stranger' vessels—reduced now to some £3000—and the wages earned by women gutters and curers in East Anglia (about £10,000) are additions to Lewis income. Some of this was, no doubt, sent home in the form of postal orders, etc., causing a further overlap, but much of it was probably sent in the form of notes or brought home in cash. In order to show the real net earnings of rural Lewis, these are separated from the output shown in the first column ((A, i) on p. 314) and are tabled under "Earnings by Crofting and Associated Rural Occupations only" (A, ii).

(*b*) *Fishers' Earnings.*—As no figures of local earnings are separately published, estimates must be based upon the collation of the Fishery Board's *Annual Statistical Tables* and accompanying *Annual Reports* with careful local enquiries. By 1938 the fishermen on Stornoway District herring fishing vessels were reduced to about 350 men and boys in the summer season, of whom only a few worked in autumn and winter. Their earnings included the earnings of share owners of boats and of nets, and of those without shares, the latter being only a fraction, say a quarter, of the total. Nearly 100 District men still worked on 'stranger' (East Coast) vessels at the summer fishing and rather fewer at the East Anglia autumn fishing. The sum so earned may have been a third or more of the earnings on District vessels. Altogether the total net earnings from herring fisheries received by all fishermen from Lewis proper came to little more than £8000. By 1938 the

crippling losses suffered after 1914–18. A beginning has certainly been made. The Herring Industry Board's scheme for 'Queen of Scots' kippers will help the Minch fishing. It will not necessarily help the ports of Stornoway or Tarbert, because herring can be landed at mainland ports and treated there or else taken by road to the Moray Firth, kippered there, and still qualify under the scheme. The Scottish Agricultural Organisation Society has aided the marketing of lobsters to good purpose.

(iv) *Other Sources of Income earned in the Island*

It is to be hoped that members of the Lewis Association may ascertain these, perhaps in collaboration with University research workers. This, in turn, might instructively be collated with the imports and exports of the Island, which are recorded and ascertainable with a precision impossible for a similar area on the mainland. Thus the facts would throw light on the economy of other crofting districts.

(v) *Allowances, Pensions, Unemployment Assistance and Remittances*

With regard to money received by the crofting communities of Lewis from other than 'productive' sources, figures have kindly been made available regarding three sources, namely, (*a*) Allowances made to members of the Forces and their dependents, and Pensions, (*b*) Unemployment payments, and (*c*) Money Orders and Postal Orders. The yearly periods for which figures are available are close enough to permit of reasonable comparisons. Among other sources, Bank Drafts form an insignificant fraction of monies received by crofters from outside the Island. It is impossible to say how much cash is brought home by men paid off from the Merchant Service and other employment, or how much may be sent through the post in the form of notes, whether registered or unregistered. The amount is known to be large, however, and an estimate based on the number of insured employed, and other figures, would be of value. A token figure is suggested in a note to the concluding Table.

For the year 1937–38, Allowances paid to members of the Forces and their dependants in Lewis (proper) came to £40,000. Of this sum a greater part was paid through Stornoway Post Office than might have been expected from the town's population. But able-bodied recipients of Allowances are attracted to the town by the likelihood of finding work there, while men of higher rank and pay are apt to be townsfolk, and their dependants also. Old Age, Orphans' and Widows' Pensions exceeded £80,000. Of this sum a relatively large amount was also paid through Stornoway Post Office, partly for administrative reasons, rendering other causes harder to disentangle.

We turn now to the next source named, Unemployment Assistance. The Bureau made payments of £120,000 in 1936—the last year for which relevant statistics were made available. Of this sum, about one-third was Insurance Benefit, derivable in principle from the joint earnings of workers, and two-thirds were Public Assistance, contributions to which were made from local rates. The fraction paid to Stornoway workers was relatively small, and may be estimated at barely £10,000, that of rural payees accounting for the remaining £110,000. As the Means Test took account of the croft (or smaller holding with house), the average payment to individuals was small.

Turning to Money Orders, and taking the balance of payment and issue at face value, there was actually an outflow from the Island instead of an influx, for the issues exceeded the payments. In Lewis in 1937–38, whereas nearly £60,000 was issued in Money Orders, only a little over £30,000 was paid. Even allowing for the fact that part of the payments is cashed through banks or cleared at a central Post Office on the mainland, there would appear to be an outflow, as centralised clearances probably amount to no more than 35 to 40 per cent. The amounts in Postal Orders paid were smaller, totalling £23,000, and the difference between payments and issues less.

Comparisons between town and country are instructive. Stornoway's position as a shopping centre is reflected in the heavier average of Money Order payments per head per annum as compared with rural areas (£8·4 as against £1·1); and the

difference between the issues and the payments in rural areas (£28,000 as against £13,000) is no doubt due to orders drawn to pay accounts. In this connection, a comparison of conditions at an interval of nine years is suggestive for any attempt to distinguish the difference between rural incomes before and after the economic depression. In rural Lewis the total Order payments fell from over £33,000 in 1928–29 to barely £22,000 in 1937–38, a fall of more than a third. Although a decline in the payment of Money Orders in Stornoway was partly offset by an increase in that of Postal Orders there, it is thought that even this reflects a fall in the cash available in the townships, by indicating a fall in the average amount of accounts paid by country customers to Stornoway tradesmen. Even here, it is true, some allowances must be made, as latterly more shopping was done by customers coming into Stornoway by car and probably paying to a greater extent in cash.

Comparisons may now be made, for all the data quoted, between Stornoway and the rural or 'landward' areas of Lewis, and also between landward parishes for all except the Unemployment payments. Population having changed but little from 1931 to 1938, and economic conditions not being very different in the Island in the financial years 1936 and 1937–38, an approximation can be made of payments averaged per head of population. In the following table these are shown in £ sterling to one decimal place.

Average Payments (per Head per Annum)

	Stornoway Burgh	Stornoway Landward	Barvas	Lochs	Uig	Average Landward
	£	£	£	£	£	£

(b) Unemployment Payments	2·6	..	..	..	..	5·1
(c) Money and Postal Orders	(8·4)	1·0	0·9	1·2	1·3	1·1
Total	..	..	..	..	..	10·1

yards (a weaver's yard is equal to 8 feet, a measure which derives from the size of the frame once used to wind banks of yarn). Payment varies according to the number of colors used in the pattern. A weaver may average 2½ tweeds per week when the work is available, thus earning more than mill workers. A female mill worker earns about L11 or L12, and her male counterpart about L3 more.

Because weavers are classed as self-employed, they do not qualify for unemployment benefit. They may apply for social security, but must submit to a "means" test, and the possession of bank savings or other assets disqualifies them from receiving such aid. All British workers must pay a weekly sum for "insurance stamps," a certain number of which makes the workers eligible for small payments from the government during periods of illness. Self-employed persons must pay for their own insurance stamps, whereas employers pay for the stamps of their workers. A weaver who does not keep up with his payments of over one pound a week for insurance stamps must pay the accumulated debt at a later time.

Weavers face other costs. They buy looms and bobbin-winding machines, and pay for lighting, heating, and the maintenance of all equipment. The preservation of this anomalous status of "self-employed" is related to the

attempt to preserve the image of Harris Tweed as a cottage industry, and thus maintain its market value. Many weavers, politicians and businessmen argue that the weaver should be reclassified.

However, the status of weavers as self-employed is not simply bureaucratic jargon designed to preserve the Harris Tweed industry. In most employer-employee situations, people are hired with the understanding that they have certain qualifications and will perform certain jobs. Weavers are not under such expectations and obligations. A mill has little idea of the skill or motivation of the weavers to whom they send their yarn. Weavers differ in matters such as degree of skill and state of health, and they also differ in the amount of time available to weave, and other matters that affect their production. Some weavers refuse to do complex patterns; some are busy with croft work and do not want to do "urgent" tweeds; others who are recovering from illness may prefer not to weave the heavier tweeds. The tweed van sent out by the mills to make deliveries all over the island meets one such variable situation after another, and thus finds it difficult to meet the demand of the Weavers Union, that tweeds should be equally distributed among all weavers on the island. Theoretically, the mills are supposed to deliver tweeds in strict

CROFTING CHANGES

The removal of crofters from good to poorer ground was a significant factor in the destitution years of the nineteenth century, with the self-sufficiency factor becoming smaller and the dependence on imports (when there was money to buy these) increasing. Today, the crofter is of course not self-supporting, his economy being based on fishing and weaving with the produce of the croft yielding an annual average of some £200.

Acreages under certain crops show this trend to dependence on the produce of mainland farmers. In the island in 1911 some 3,673 acres were under potatoes, the present acreage being about one-third of that. The number of people per acre of potatoes for Scotland as a whole is 22 : 1. In the island it is about 15 : 1, indicating a heavy domestic consumption. Yet substantial imports of this crop are required to satisfy demand; a relevant point is that the milking cow commonly shares the potatoes. The barley crop, once much used in Lewis's former small distilleries, has been reduced to some 10 per cent during the past fifty years. On the other hand, the acreage of sheaf crops, oats, rye and mixed corn, generally fed to cattle, has about doubled. Oats in particular are in favour for cattle fodder; even before the turn of the present century oats were not widely used for human food, and oatmeal has for centuries been imported into the region. The turnip acreage has halved over the past fifty years, perhaps the result of the gradual disappearance of the horse, its steady labour and its dung being required to put good heart in to the land.

As the crofters' cropping policy has changed over the past half century, so has their animal husbandry. Animals are a main selling product, particularly cows and sheep. Horses, of course, have been drastically reduced from their total of 1,672 in 1911, as tractor, lorry and van have taken over their work. And though some cattle are raised, the numbers are now about 60 per cent below those of 1911. At that time the density of cattle per 1,000 acres was heavy (46-60) in the north-east of Lewis, less (31-45) in the north-west, and still less further south. The present average is around 18 beasts per 1,000 acres. This decline, in particular in the milk-yielding animals, has compelled Lewis to import 1,000 gallons of milk a day from the mainland.

It is sheep which today claim pride of place on the croft, valued

AGRICULTURE AND FISHING

for mutton and for wool, the right type for translation into Harris Tweed; the predominant breed is the blackface, whose fleece is hard, wiry and long-lasting. The demand for raw wool has also encouraged larger flocks among crofters in such places as Barra, where virtually no weaving is done in the immediate locality. In general there has been since 1911 a 40 per cent increase in the livestock carried on the island's crofts, about twice as big a rise as found anywhere in the seven crofting counties of Scotland.

In an attempt to reduce Lewis's milk imports, in 1962 three crofters at Garrabost on the Eye Peninsula combined to set up a small dairy farm using the lands of their three crofts. A new dairy byre and dairy premises were built and equipped with the necessary electrical equipment. Grants were given by the Department of Agriculture & Fisheries for Scotland, the Crofters Commission, and the Highland Fund Limited. The first year of operation was closely supervised by the Lands staff of the Department at Stornoway and guidance given as necessary. The milk is retailed in Stornoway and district and amounts to about 5 per cent of Lewis's daily consumption. This little scheme has shown that the island could with some organised effort become independent of milk imports, which have been estimated at upwards of £100,000 worth per annum. Over £70,000 per annum is also spent on imported butter and cheese.

In 1947 the number of crofts in Harris and Lewis was 4,020. In 1971 the figure was 4,146 (3,592 being in Lewis), representing a slight increase in a quarter of a decade. Thus, crofting as a land use activity in the island provides a fairly stable element in the economy, although it is subsidised by the crofters' participation in the fishing and tweed industries. A crofter, it should be mentioned, is often a tenant of more than one croft, working them together as a unit. These units vary in size, the greatest bulk of them (about 60 per cent) having up to 5 acres of arable land. About 2 per cent contain over 30 acres of arable land. In recent years there have been proposals for the better use of the reclaimed moorland, particularly for cattle-raising, which would offer the crofter an increased cash yield from his interests. The annual reports of the Crofters Commission indicate, indeed, that the trend to the small croft obtained from the fragmentation

TRADE AND INDUSTRY

womenfolk, giving a ratio of only one male weaver to fifty-five families. In Lewis, male weavers were more common: one to every twenty-five families. The making of whisky was introduced about the seventeenth century. This was in addition to the old drink of home-brewed beer or ale *(lionn)*, and much of it was made to pay rents; it must have consumed a considerable quantity of valuable foodstuff. However, the spread of distillation as a legitimate home industry by which the rent could be paid, in kind or by sale, was followed by legislation prohibiting all but very large stills; illegal distilling of course went on in a small way.

It was, then, by a very narrow margin that subsistence was won in the island some two centuries ago. Many times famine showed how close was the wolf to the island doors. The introduction of the potato, and the interest in the fishing industry led to an increase in the population, though as discussed in Chapter 3 this in turn brought more problems. Basically, the island economy had never been organised on a sound foundation, with the result that winds of change blew where they would with little or no control.

A new factor in the island economy was introduced after 1750. This was kelp-making, the cutting and burning of seaweed on the shore for subsequent use in the manufacture of alkali for the glass and soap industries. The first tentative move in the island was made by MacLeod of Harris in 1748, when he allowed some Irish labourers to make kelp on his shores; so little was the product's value realised at the time that he only charged them 2s per ton manufactured. As the burning of kelp came to be understood, and the marketable value of the product ascertained, the native population set to. Between 1772 and 1864, about 50 tons were produced in Lewis each year, compared with some 800 tons per annum in the Uists; the Harris figure was 500-600 tons. The growth of the industry began to snowball, and the Minister of Lochs, writing in the *Old Statistical Account*, states that at the time (1796) some 50 tons were being produced in that parish per annum. In Stornoway parish, though no figure is available, the minister reports that kelp-burning was the principal manufacture, and that everyone able to fill a creel, or carry one, was employed at it for about three months of the year. Little of it seems to have been done in Barvas parish. The price of kelp varied

HARRIS TWEED

finished cloth. About 1,000 workers are employed at the mills, representing about 95 per cent of the island's industry—not counting, of course, the 1,200 or so self-employed weavers. The Shawbost mill, started in 1915 in a very small way, employs about seventy people from the surrounding crofting community on dyeing the wool, carding it and spinning it into yarn, and has about 500 weavers on its books. In 1955 it became a limited company and a £35,000 finishing plant was added; other recent extensions have been made to the tune of £70,000. The establishment of such a large industrial complex in one of the remotest parts of Britain is an achievement to be underlined.

288 464 [473]

The early cloth industry

Coarse woollen cloth has been made in the Hebrides, as in other rural Highland areas, from time immemorial. Rents were often paid in blankets or plaiding. In 1656, 'pladding' was one of the items of trade brought by Highland boats to Glasgow for sale there. In the late eighteenth century, blackfaced sheep were introduced into the Highlands and islands; the fleece from this breed was much heavier than that of the native sheep and consequently proved ideal raw material for local woollen manufacture for trade. In the Hebrides, the product was mainly for domestic and local consumption. The people of Harris, however, were well known for the excellence of their weaving which found a limited external market. In 1844, the Earl of Dunmore, the first non-native proprietor of Harris, had the Murray tartan copied in tweed by local weavers, so successfully that the Earl and his enterprising wife encouraged improvements in the product and introduced it to their friends. The cloth, ideal for outdoor pursuits such as fishing and stalking, found ready wearers. In 1857, an Edinburgh lady went about getting orders for the Harris weavers, and business increased so much that in 1888 she moved to London and opened a small depot for tweeds.

288 175* [427] [236] [438] [439] [444]

Thus by the time the nineteenth century had reached maturity tweed was becoming well known, and weavers and local merchants, usually shopkeepers, developed sales contacts on the mainland. At that time every web of tweed produced was unique: it could never be copied exactly. This of course added to its charm

THE OTHER ISLANDS

The flesh of puffins, gannets and fulmars was the staple diet of the St Kildans; the oil and feathers were the vital exports that paid the island rent to MacLeod of Harris, the owner of the group. These exports also helped to pay for the purchase of such foodstuffs as salt, sugar and tea, and other items which the island could not itself supply. The St Kildans owned some hundreds of sheep, the wool being spun and woven into tweed, and a few cattle were also kept. But the seabirds were the foundation of the island economy.

361 162 *175 [262] [427] [236]

The factor which led ultimately to the desertion of the island group was isolation. The community there was throughout its history undoubtedly the most isolated in the British Isles, though until the present century this mattered little to the St Kildans. All that was deemed necessary for the continuation of the community was that, once a year, MacLeod of Harris should send his factor over from Skye to collect the island goods that were to be sold, and to bring with him those provisions which would see them through another twelvemonth. However, as the demand for the island's products declined, communications became more important: to support the family a man had to leave to find work on the Scottish mainland. Large-scale emigration began in 1852 when thirty-six islanders (with State aid) left for Australia. Island life was punctuated by loss of life; boating disasters and cliff-falls in particular deprived the community of the vital male elements needed for survival. Tetanus infantus, known on St Kilda as the 'eight-days' sickness', strangled two of every three babies born; this disease ravaged the island for almost a century and again struck harder at the male sex. About 1810 the population was about 200, a definite overcrowding. By 1861 it had fallen to 78; in 1911 it was 80, and in 1921, 73. A decade later it was nil.

[438] [178] [464] [167] [164] [165]

Isolation tended to make the St Kildans a human menagerie. With the improvement in boat services, St Kilda became a 'must' on tourist itineraries. The tourist trade took on an economic importance for the population after July 1877, when the *Dunera Castle* steamed north and west for a voyage to the 'romantic Western Isles and lone St Kilda'. The steamers continued to call throughout the three summer months annually for sixty years, their passengers eager to buy souvenirs: tweed, quern stones, spinning wheels, stuffed birds and eggs; indeed, anything to remind them,

484 361 *175

schemes, and knowing how much local fishing depended upon international policy, particularly the resumption of trade relations with the chief customers of the past, Leverhulme, one feels, should have dealt no less outspokenly with these. The removal of trade barriers lay not in the hands of the Scottish Office or of Scots officials (however internationally minded these might be as private citizens), but in the hands of Ministers of Cabinet rank and leading financiers, of whom Leverhulme himself was one.

159 458 433 228 [656]

In brief, the Scots fisheries suffered after the war as neither Leverhulme nor others had foreseen when first he laid his plans for the Island's prosperity. It seems clear that had this major change been squarely faced by Leverhulme and Government alike, in 1920, 1921 or even later, they could never have fallen apart about a relatively minor issue, that of the farms. Both sides turned their faces away from this disquieting factor of the Baltic markets, though both knew it to be fundamental to the success of Scots fisheries and the Island's future. Had they faced it together frankly, then, even if powerless to effect a remedy, their sincerity might have prevented a deadlock upon a secondary matter.

458 433 228 [473]

To Leverhulme, given his large scale of expenditure and return, the division of a few farms formed a minor issue. But to a number of ex-Servicemen, 'crofters' without a croft, the division meant a home and relative stability. Moreover, what was merely a matter for personal decision to Leverhulme, was a lifelong issue to many people brought up in congestion on the wrong side of the boundary fence. Meantime, milk from Easter Ross was available in Stornoway, at town if not at country prices. Lastly, further possibilities of land-development lay open to Leverhulme, though not so readily to the unaided people. In reading

159 473 185 433 473 [438] [114]

construction of the Island must rest upon the improvement of the land": and secondly, that by this means "it was imperative to revive the traditional community spirit, the essential feature of Hebridean civilisation". Those words still hold good. Yet the land itself is too barren and the soil too poor to provide a living for many by export of fresh agricultural produce to the mainland. Only a local market could pay a fair price for most of the products of intensive small-holding. Judging from the free, untrammelled trade before 1914, Leverhulme held that fishing could be set upon a commercial basis in the Isles; and there could be few better judges of commercial possibilities than this keen industrial thinker and organiser. If he was right, as surely he was, to begin with, then the local market to be created, or rather enlarged by growth of population and prosperity at Stornoway, could have purchased the fresh milk and eggs, the fresh greens and fruit, raised on enlarged small-holdings and marketed co-operatively.

185 311 114 [438] 159 433 228 438

A final comment remains to be made. The community spirit of Scots fishers from Berwickshire to Barra has gone far to make co-operation among the men of the crews a living thing. 'Work for Wages' offered little outlet for this, indeed it virtually suppressed it; and 'co-partnership' on the Port Sunlight model was a very different matter from the co-partnership of a crew. Even if at that time it had been proved impossible to organise free co-operation in fishing, co-operation in small-holding townships might have kept the communal spirit alive, for later renewal at sea.

181 476

It is not easy to assess the after-effects of Leverhulme's activity. Leverhulme certainly helped hundreds of families by the provision of wages for the building or rebuilding of roads and other works, of which some were completed

114 433

4 COMMUNICATIONS

FROM the earliest times, the provision of communications in one form or another has been a matter full of incident and high colour. Gaelic folk-song contains many references to the hazards of crossing the impatient waters of the Minch. One such, a waulking song still known today, commemorates the death of Iain Garbh Mac Gille Chaluim, of Raasay in Skye, who was drowned in April 1617 on his way home from visiting the Earl of Seaforth in Lewis; it is said that he was drowned through the workings of his own 'muime', or foster-mother, who employed several famous witches to raise the tempest in which his ship foundered.

For well over a century the subject of adequate communications has aroused continuous argument. The strength of any island community lies in its ability to live within itself, while accepting the periodic injection of certain external items necessary for living or for work. A Londoner once expressed amazement at the isolation of Scarp, in West Harris, commenting that in Scarp they would not know what was happening in London. The indisputable rejoinder was 'Nor do they know in London what we would be doing in Scarp.' However, to a large island community, with a certain degree of economic significance, communications are the basic lifeline.

SEA ROUTES

When in the early 1800s formal sea communications were being established between the island and ports on the west coast of Scotland, down as far as the Clyde, most of the islanders were of course little affected. Except for the professional classes (merchants, ministers and the like), they had little use for the sea links provided for them. Their economy was not yet a cash economy, and travel was thus a luxury they could not afford. As the nature of local life began to change with the infiltration of some of the

228 and its neighbourhood becoming the centre of the growing in
*175 dustry. In 1793, the Lewis Parish contributors to the *Old Statisti*
cal Account of Scotland indicated that upwards of 183 boats wer
[463] fishing off the island. In Uig no less than 275 netmakers wer
recorded, showing that the fishing industry was prosecuted wit
[286] some measure of enthusiasm. 'All the people dwell in little farm
villages and they fish in the summer season. The women do no
[462] fish; but almost at all times when there is occasion to go to sea
they never decline that service, and row powerfully.' In the paris
[237] of Barvas in the eighteenth century some 9,000 Scotch pints o
oil were taken each year from dog-fish livers and sold to Storno
way merchants at from 6d to 8d per pint; it is related that th
tenants of Ness were able for a long time to pay their rents wit
[433] the oil proceeds. Cod and ling were the principal fish caught b
the men of Lochs, an annual average of 24 tons being cured an
sold in Stornoway. Generally, other fish caught were consume
locally.

Loch Roag on the west of Lewis proved to be about the be
fishing ground; in 1794 about '90 sail' from all parts of the Unite
Kingdom were at the herring fishing there. At one time Loc
228 Roag-cured herring was exported exclusively to Sweden. Th
*175 minister of Stornoway, contributing to the *Old Statistic*
•439 *Account*, gives figures showing the quantities of fish shipped fro
the port from 1791 to 1796. During these six years some 14,00
barrels of herring were exported to the Continent, and 20,00
sent for consumption in Britain; some 350 tons of cod and lin
were destined for Continental markets. Herring, cod, and ling we
thus pursued during the following years with growing vigou
though the inshore white fish took favour. The herring fishing di
not make great strides, mainly because to the middle of the nin
teenth century catches were confined to the inland sea lochs; th
people for the most part were not familiar with deep-sea fishin
and their boats and nets were not suitable for it.

228 Indeed, when Sir James Matheson bought Lewis in 1844, h
gave scant attention to the potential in the fishings round h
*175 island. Though he expended considerable amounts in securing
[504] regular steamer communication between the mainland and th
island, and spent over £2,000 in building a quay at Stornowa

of potato crops by blight had contributed to widespread poverty. The production of cloth for non-local markets was promoted initially by philanthropic proprietors in an effort to ameliorate such conditions. Lady Dunmore, of the Dunmore family that owned Harris during most of the 19th century, was largely responsible for developing a market in London and elsewhere for cloth woven in Harris. The cloth was popular first among the aristocracy, who wore it for hunting and other sporting occasions. The romantic image of a cottage industry promoted for charitable purposes contributed to the market value of the tweed.

The market expanded in the second half of the 19th century, aided by ladies of leisure who followed the example set by Lady Dunmore (cf. Hunter 1964: 24-26). The production of cloth for a commercial market spread from Harris to the southern isles, but was slow in coming to Lewis, where the proprietor, Sir James Matheson, provided the people with construction jobs. After Matheson died in 1878, weaving for outside markets began in Lewis in the parish bordering Harris, and the name "Harris Tweed" was used because a market for cloth of this name had already been established. By World War I, weaving for outside markets was being done in all four parishes in Lewis. In 1899 there were 55 looms in Lewis and over 200 in Harris.

288 developed from the concentration of power in the hands
175 of the merchants. In the early days of the industry,
441 all the processes involved in the production of a
286 finished length of tweed were carried out by individual
236 families. A man used wool from his own flock, and with the
438 aid of other family members, dyed it with vegetable dyes,
175
[386] carded and spun it by hand, wove it, washed and shrunk
286 it, and found his own buyer. Dyeing wool, spinning yarn,
232 and washing ("waulking") the finished length of tweed
175 was usually done by women. In Harris, the entire process
462 of producing a tweed was carried out by women, but in
Lewis the weaving was done largely by men.

175 A woman in her 80's recalls the process of weaving
286 when she was young. Hand-spinning had died out by this
time, although the question of whether tweeds woven with
such yarn could legitimately be called Harris Tweed was
not resolved until 1934.

175 "About 1916 or so it took about two weeks to a month
283 to do a tweed. You bought the wool from the Agricultural
[435] Board. Sixteen bags of wool, costing about L20, would
[433] do four tweeds. You needed four one-stone bags per
[386] tweed. Then you would spend a day gathering a bag of
[824] crotal (lichen scraped from rocks and used for dye). One
bag per one bag of wool was required for the dye. After

CONCLUSION

121 The importance of the 'regional' movement is inter-
185 regional and indeed international. In the case of the
Island, international order is required for its fisheries to
438 recover, and for its weaving to find purchasers abroad as
well as at home. This in turn could allow small-holding
to find an Island market in its little burgh, Stornoway.
Without this triple basis of fishing, weaving and crofting
for its economy, Island society will break up and its culture
[182] vanish, not evolve. It is no less true that only by the best
utilisation of each regional environment, economy and
society as we find them, will profiteers be held in check
at home, and powerful peoples cease to exploit the sweat
of others.

121 A pioneer American Report acknowledges the debt of
171 regional survey for the New Deal not only to France and
Germany, but to a group of practical idealists, of geo-
[185] graphers, biologists and sociologists in Britain.[1] If nation-
[433] ally we can be proud of Scots and British initiative in
[184] planning, we must own, until recently, to humiliating
slowness in its execution, and in the mobilisation of regional
resources for social ends. The chief end of our planning
must be the re-making of society. In Britain it is not
always realised that in the great developments of the New
Deal the execution of concrete schemes which include civil
engineering, industrial expansion and agricultural con-
servation, is accompanied by real cultural achievements,
both urban and rural. Not only are geographers and
economists, technicians, industrialists, and officials called
to survey and plan the Tennessee Valley, but sociologists
and educationists are required to complete the work. Not

Uig

Unlike the
mainland farmer, should an islander withdraw his store
432 stock from the autumn sale he cannot easily present it elsewhere a few weeks later; he
437 must keep it from the autumn until the spring, which will probably involve him in buying
feeding stuffs out of his seriously depleted income. Many crofters suspect that their
difficult position in this respect is taken advantage of by mainland buyers. Whether
this is true or not the result is the same - the crofter is discouraged from raising stock.

Many crofters with whom we discussed this problem realised that, by fully stocking
433 and cultivating their crofts they might double, or even treble, their income from
agriculture. Some realised that sound management of a large unit, such as the
amalgamation of two or three crofts, by subleis or otherwise, might yield a reasonable
family livelihood. What they all stressed was the uncertainty - the uncertainty of stock
and wool prices, the uncertainty of subsidies from year to year, the uncertain fortunes
of their little packs of sheep and the uncertain effects of the weather on their hay and
oats harvest. In other words they lack confidence - in both the cash reward for
agricultural operations and in their own technical ability. Therefore they prefer to take
a sure weekly income, however small, and to work their land at a low level of
productivity.

000 Climate, soil, and insularity (to which must be added the particular isolation of south
Uig and Berneray, even within Lewis) all present problems. But there is a tendency to
overstress these difficulties and to use them as excuses, whilst failing to appreciate that
they also offer certain opportunities. Many agricultural raw materials have to bear the
[432] cost of shipping from Glasgow or from Leith; the peculiar difficulties of island stock
marketing have already been mentioned; but, equally, the Minch could and should
provide a natural protection for island agriculture. Elderly milk and travel-worn
fatstock, potatoes and vegetables, imported daily into Stornoway from the mainland,
are a standing reproach to crofting agriculture. Crofters could produce most of this
food and if they would they would be turning to advantage the disadvantage of insularity.
Some will admit this, if pressed, but they will also rightly point out the difficulties.
These are two-fold: technical (particularly in the case of legal restrictions on milk
production for sale) and economic (the difficulties, or believed difficulties, of marketing).
A few individuals, for example, claimed that it was not worth selling potatoes unless
they received the full shop price: this is a stubborn and stupid attitude; and one is
reminded of the crofters' long opposition to the introduction of the potato, nearly 200
years ago; a co-operative marketing organisation might help in this respect.

The crofters' attitude to innovation is all-important; new ideas, whether in
829 agricultural practise or in marketing, require careful introduction and a good deal of
fostering. The crofters' lack of confidence is a real factor and must be taken account
of; it is not due only to the risk and uncertainty of markets, they also lack technical
knowledge, even though they may have plenty of ability. Again, the prevalence of
small units makes it particularly difficult to adopt innovations; a failure which might be
negligible on a large farm can become a disaster on a croft. The crofter has not the
resources of the farmer with which to experiment, nor has he been able to observe other
methods or crops on other farms because he lives and works in a restricted environment,
[654] surrounded by fellows in like situation. The introduction and development of township
re-seeding schemes by the Agricultural Advisers is an excellent example of how these
difficulties can be solved. Good progress has been made since our survey. Because
such improvements are communal they tend to add to the flexibility of the township
structure; because they extend the grazing season in spring and autumn they tend to
reduce the need for winter fodder and so to reduce the cultivation problem. Far more
[464] re-seeding could be done, particularly in South Uig and Berneray. Here the lack of
local employment makes agriculture more important as a source of income than else-
where and the need to improve the productivity of agriculture is both great and urgent
if population is not to fall below the minimum level for maintenance of services. This
special problem deserves special attention, by both local communities and by the
authorities. If South Uig and Berneray could carry a further 800 head of cattle, which is
no more than was carried in 1883 (and is still less than the scums), the problem would be
well on the way to solution.

Park

[Kershader]

241 with heather and peat on the higher areas, hay is taken off 19.25 acres. Four acres, mainly for
511 potatoes, are worked by spade but most of the cultivation is by tractor hired from Balallan or,
[402] in 1958, from Habost. Laybeds are common and in some cases are carefully renewed, but
the present tendency, reaching its extreme in a field of about two acres on one croft, is towards
the formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in
240 zones (a) and (b), with little development of (c) at present. The only crops are oats and potatoes,
246 with some garden plots of cabbages, turnips and carrots. The potato main crop is generally
Kerr's Pink (Golden Wonder on one croft), with a couple of rows of Skerry Blue or Edzell Blue
198 for earlies. There is no memory of Black Oats (Avena strigosa), and bere (Hordeum vulgare)
[256] has certainly not been grown since 1930, and probably not since 1909. The oats are grown
[439] exclusively for winter feed and are hand-threshed with stock and comb as the need arises; the
last water mill in the locality went out of use after 1914, the last handmill in 1916; no grain
has been sent to Stornoway since about 1930. Rotations are extremely irregular: some lazy-
beds are still cultivated with alternate crops of oats and potatoes and have heavy seaware and
manure fertilisation, but most other arable areas have some sort of oats, potatoes, oats, sown
[326] grass sequence. Fertilisers used are seaware and manure (ten crofts), manure (eleven crofts), shell
[329] sand (one croft), lime (ten crofts) and artificials - 'Potato manure' and sulphate of ammonia -
on eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters'
Agency.

251 The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The
405 plough was first introduced in 1936. When a tractor from Balallan became available for hiring
253 in 1953, the horses were disposed of. The present soums are by cow, young beast and sheep
per croft in proportion to rents and range from 3 cows, 3 young beasts, 69 sheep down to 1 cow,
1 young beast and 23 sheep. Eight crofts exceed their entitlement but no croft hasless than half the
souming and the deficiency is mainly in cattle, especially young beasts. On the other hand, no
operative unit is entirely without cattle as manure is extremely important. Cattle are kept for
254 domestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months.
432 10 acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows
123 is developing:-
251
253
511

(a) As soon as the weather allows in May, the cows are put out in the park for about three weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new outer fence erected in 1957.

(c) Back to the park for about five weeks.

(d) Return to the crofts for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

[198] The young beasts spend much of their time on the outer common grazings. As most of the crofts,
beginning with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced,
the old arrangements for township commoning from 15th October to 10th May are now obsolescent.
Another park was also fenced for general purposes and for weaning in 1957. Prices for calves
[439] and cattle are very low and this discourages cattle breeding; on the other hand, lack of winter
keep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the lambs, are cleared from the crofts for the tupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

175 On one of the crofts along the strand are the
228 ruins of two curing houses, where the fish were salted
[348] and dried. Ling, cod, skate and halibut were cured
• [439] and sold to local merchants for export. "The same as
[171] they do in Iceland this very day. That was the main
175 industry. Then the English came with their steam
648 trawlers; they ruined the fishing here, and then went
228 west to Iceland and the Faroes. In Iceland they get
fined for poaching, but here the trawlers often ignore
[433] the three-mile limit. But the fishing was the mainstay
here, before the Harris Tweed came along."

175 One man returned from sailing in 1932 and bought a
228 boat for L24. He had 32 lobster pots, and made L7 one
435 June by selling the lobsters at a shilling apiece.
501 Another man, who returned from the United States in 1934
[454] because of the depression, bought a share in a 14-foot
[471] boat. It was made in Ness, at the northern tip of Lewis,
[434] and cost about L14. He and his partners went out every
night possible; the fish provided an important part of
their income. The boat was sold in the 50's. "It wasn't
175 being kept up anyway." Around World War II there were as
228 many as twenty boats; men fished at night, after a day's
501 work. Today there are four 12-foot boats in Shawbost,
178 each shared by four or five men. The boats are used
501 intensively for fishing during certain times of the year,
228

286 of potato crops by blight had contributed to widespread
175 poverty. The production of cloth for non-local markets
731 was promoted initially by philanthropic proprietors in
735 an effort to ameliorate such conditions. Lady Dunmore,
286 of the Dunmore family that owned Harris during most of
175 the 19th century, was largely responsible for developing
741 a market in London and elsewhere for cloth woven in Harris.
• 439 The cloth was popular first among the aristocracy, who
[565] wore it for hunting and other sporting occasions. The
[438] romantic image of a cottage industry promoted for charitable
[435] purposes contributed to the market value of the tweed.

The market expanded in the second half of the 19th
century, aided by ladies of leisure who followed the example
286 set by Lady Dunmore (cf. Hunter 1964: 24-26). The
441 production of cloth for a commercial market spread from
175 Harris to the southern isles, but was slow in coming to
[464] Lewis, where the proprietor, Sir James Matheson, provided
the people with construction jobs. After Matheson died in
1878, weaving for outside markets began in Lewis in the
parish bordering Harris, and the name "Harris Tweed" was
used because a market for cloth of this name had already
been established. By World War I, weaving for outside
markets was being done in all four parishes in Lewis. In
1899 there were 55 looms in Lewis and over 200 in Harris.

288 in Shawbost: a very small business, which until
441 recently did not even have its own transport but
458 hired facilities when they were needed and simply
went into hibernation when orders stopped coming;
a medium-sized business, which went into liquidation
in 1971; and a large business, which continues to
survive despite a depression which has continued
since the late 1960's.

288 Harris Tweed is sent to markets all over the
441 world; but because of the difficulty of maintaining
464 a large labor force, the filling of orders is sometimes
• [439] slow. If large orders cannot be met, weaving as an
island-wide occupation cannot be maintained. The
number of weavers on the island fluctuates, as slack
periods come and men adopt the time-tested strategy
of temporary migration in search of other jobs. One
[468] of the factors which aided the weavers during their
[175] strike of 1943 was the fact that so many other jobs
were available during the war that the future of the
industry was jeopardized.

288 In the last five years the number of mill employees
464 has decreased from 800 to 500. The decrease is due in
[178] part to the introduction of more efficient techniques
and new equipment, but there is little room for improve-
ment in the production of tweeds because the human
element, the weaver, is essential to its productio

AGRICULTURE AND FISHING

subsequently despatching them to various dealers in the south. The local trawlers catch white fish and prawns with the same gear, but whereas most of the prawns are landed locally the white fish goes to Gairloch on the mainland for transportation to the Aberdeen market. Attempts have been made to overcome the distance between the island and good-paying markets: in 1966, by collaboration between Stornoway fishermen and the London Fish Merchants' Association, a consignment of 200 boxes of fish was sent direct from Stornoway to Billingsgate, bypassing Aberdeen. The fish was first frozen, then taken by SS *Glanaman* to Mallaig railhead and thence to London by rail. It arrived twenty-six hours after leaving Stornoway, in ample time to catch the day's customers. The experiment is to be repeated at intervals. On occasions in the past, shellfish such as lobsters have been flown to Continental markets.

Lobster and crab fishing is an important part-time occupation in the island. In the past it tended to be rendered uneconomic by the heavy losses (sometimes up to 25 per cent) during transit between Stornoway and Billingsgate, but storage-ponds now help retain a reserve for market demands: a lobster-pond at Stockinish in Harris can hold about 25,000 fish, and the pond at Bernera, Loch Roag, can take 30,000. Marketing is done by an agency on behalf of the fishermen, the value per annum being around £50,000 for lobsters caught in the Stornoway Fishery District, and some £40,000 for prawns. The value of white fish is about £30,000 and of herring about £35,000.

6 TRADE AND INDUSTRY

IN the earliest times, the folk of the island of Harris and Lewis were self-supporting; all that they needed for life as it was lived in those days was available at near hand; their existence was self-contained, the economy virtually self-sufficient. By and large, the only commodities often imported were salt, iron, and, to a certain extent, wood. Rents were paid largely in kind: the produce of agriculture, fishing and labour. Surplus produce was directed to southern markets to bring in the odd shilling or two for which there was really very little need in the island. But once money became important in the national economy, it was not long before it was required in the island economy too. By 1790, if not well before, two or three open boats set out each year from Uig to Glasgow, laden with salt beef and dried salt fish. At about this time, too, changes were making their slow appearance in the island way of life and living. Specialists were being required: smiths, tinkers, shipwrights, netmakers, boatbuilders, weavers, tailors and millers. Each of these craftsmen generally held some cornland, either individually or in shares, and also had some rights in the common ground of the township in which he lived.

CROFTER INDUSTRIES

From the pure crofter class there emerged the crofter-craftsmen. In Lochs, for instance, by the turn of the seventeenth century 80 per cent were registered as fishers and seafarers. In the west, in the parish of Barvas, some 70 per cent were also fishers, with kelp-making as a seasonal occupation. In Stornoway parish, where sub-tenants paid 30s to 60s in rent, with twelve days' service, they sold kelp to their tacksmen at 5d each, earned 20s a month on herring boats, made kelp at 30s a ton, and worked on roads for 8d per day.

In Harris in 1895, the eight trained male weavers worked for the gentry only. Weaving for the populace was done by the

TRADE AND INDUSTRY

land; his MS is in the British Museum. Lewis is described as being let by Mr MacKenzie of Seaforth for £1,200, which works out at about ½d per acre. The following list of prices of commodities indicates the main produce of the island:

The best driving cow at a medium sack	£1	6	0
The Lewes stone of butter (23lb English) per stone	0	7	0
The stone of cheese	0	2	6
The stone of washed wool	0	9	0
The grass of a cow for a whole summer	0	1	8
Kelp, per ton	3	5	0
Aqua Vitae, per Anchor (26 Scotch pints)	1	5	0
Dog-fish oil (per barrel)	2	5	0
Herrings, per barrel	1	2	0
Salmon, per barrel	1	16	0
Dried ling, per hundred	3	15	0

The exports were listed as follows:

700 black cattle; about 100 are sold to ye shipping that put in at Stornoway, and 300 are sent, salted, to ports on the Clyde. The value of the whole is about £1,430 0 0

Last year about 150 ton of kelp was made and exported	162	5	0
There are twelve stills in Lewes and from these was exported 200 Anchors of Aqua Vitae	250	0	0
Dog-fish oil, 140 barrels	315	0	0
Dried ling, 17,000	637	10	0
Herrings, 750 barrels	1,575	0	0
Salmon, 48 barrels	86	0	0
The spinning school at Stornoway from October 1763 to December 1764 produced 2,288 spindles of linen yarn	228	16	0

Also exported were dried cod, mud cod, above 2,000 sheep skins with wool on them, and some 38 stones of feathers. 'The Lewes neither imports nor exports grain', but mackerel was also an item of exports: 'The fishers on the west coast of the island cure a great deal, which are barrelled and sent to the West Indies. The only article of woolen manufacture that the people of Lewes pursue is some coarse blanketing which they send to the Clyde,

EIGHTEENTH-CENTURY ECONOMY

but their negligence even in ye article appears from their sending out annual above 2000 of wool out of the country unmanufacture.'

Harris was rented at £600. Exports were some 100 tons of kelp (£352), and the value of 250 black cattle exported alive, with 100 salted, was £445. Small quantities of cheese, wool, and the skins of sheep, otters and seals were exported. Grain was neither imported nor exported.

The plough, which is used here, and in most places of the long island, is of a very primitive construction. The length is but 4 feet 7 inches, and is drawn by four horses abreast. It has but one handle by which it is directed; the mold board is fastened with two leather thongs, and the sole and coulter are bound together at the point by a rim of iron. Besides kelp, there is little else manufactured, except a little coarse woolen yarn, and some blanketing, which they send yearly to Glasgow. They raise a little flax, of which they make some coarse linen for their own use, but import all the fine linen which they consume. In the year 1756, an American vessel in distress was obliged to put out three hogsheads of linseed in Harris, which was sown and afforded crops of flax which were above double the value of the usual crops. The east and west of Loch Tarbert in the Harris are every year revisited by the herring shoals. During the five years from 1743 to 1747, the west loch was the principal seat of the herring fishery. About thirty vessels from 18 to 40 tons, belonging to Campbelltown, Greenock, and Irvine, were completely loaded each of these years at this place.

With even a modest amount of business taking place, it was a natural step to establish commercial facilities. Stornoway men who once acted as agents became shopkeepers. The increase in the use of money attracted banks. During the Seaforth ownership of Lewis, the island had its own currency or notes, designed and printed from plates in the same style as the modern banknote. The wording ran: 'I promise to pay on demand to the Chamberlain of the Lewis or Bearer ONE POUND Sterling at the Counting Room here.' The notes carried a date and were signed by the proprietor, J. A. Stewart MacKenzie. It is not known for certain how long the notes remained in currency, when they ceased to be used, or even whether they were officially acceptable. At one time, as rare items, they fetched high prices from collectors. A number were

HARRIS TWEED

finished cloth. About 1,000 workers are employed at the mills, representing about 95 per cent of the island's industry—not counting, of course, the 1,200 or so self-employed weavers. The Shawbost mill, started in 1915 in a very small way, employs about seventy people from the surrounding crofting community on dyeing the wool, carding it and spinning it into yarn, and has about 500 weavers on its books. In 1955 it became a limited company and a £35,000 finishing plant was added; other recent extensions have been made to the tune of £70,000. The establishment of such a large industrial complex in one of the remotest parts of Britain is an achievement to be underlined.

The early cloth industry

Coarse woollen cloth has been made in the Hebrides, as in other rural Highland areas, from time immemorial. Rents were often paid in blankets or plaiding. In 1656, 'pladding' was one of the items of trade brought by Highland boats to Glasgow for sale there. In the late eighteenth century, blackfaced sheep were introduced into the Highlands and islands; the fleece from this breed was much heavier than that of the native sheep and consequently proved ideal raw material for local woollen manufacture for trade. In the Hebrides, the product was mainly for domestic and local consumption. The people of Harris, however, were well known for the excellence of their weaving which found a limited external market. In 1844, the Earl of Dunmore, the first non-native proprietor of Harris, had the Murray tartan copied in tweed by local weavers, so successfully that the Earl and his enterprising wife encouraged improvements in the product and introduced it to their friends. The cloth, ideal for outdoor pursuits such as fishing and stalking, found ready wearers. In 1857, an Edinburgh lady went about getting orders for the Harris weavers, and business increased so much that in 1888 she moved to London and opened a small depot for tweeds.

Thus by the time the nineteenth century had reached maturity tweed was becoming well known, and weavers and local merchants, usually shopkeepers, developed sales contacts on the mainland. At that time every web of tweed produced was unique: it could never be copied exactly. This of course added to its charm

THE LEWIS CHEMICAL WORKS

The Lewis Chemical Works

But it must not be at least be recorded that he made the first-ever attempts at introducing a true industrial activity on a large scale: the Lewis Chemical Works, which cost him some £33,000. The basis of the enterprise was the real possibility of turning the Lewis peat bogs into oil. The idea was sound enough, but incompetent management killed it off; its death was hastened with the discovery of natural oils in America and in the Middle East.

An experimental plant was built near Lews Castle. Another was erected on the banks of the River Creed, and to protect the salmon fish this river is famous, Matheson had to spend considerable sums in trying to keep the discharge effluent out of the waters. A third distillation plant was erected, this time well away from the Castle grounds. A kiln was built, elaborate condensers were fitted up, peat was cut and stacked, and a canal three-quarters of a mile long was cut to convey the peat to the plant. Troubles were considerable, despite the efforts of a chemist brought by Matheson from London. In time, the plant began to produce. Each working day of twenty-four hours, about 18 tons of peat were used in the kiln; another 3½ tons were used to fire the boilers. The recovery figure of crude hydrocarbons was around 5 per cent.

With reasonable success in sight, work was put in hand for the building of tramways across the peat bogs so that the material could be obtained from a greater area. Also, a refining plant was built at Garrabost, eight miles away from the distilling plant, which added greatly to costs and increased the inconvenience so far as managing the plant was concerned. For some ten years, the Lewis Chemical Works produced quite valuable products. One of the first, which found a good market, was a lubricant for wagon axles and heavy machinery; within a short time of its introduction the demand exceeded the supply. But, instead of increasing production, the management authorized the addition of water to a 3-ton consignment for Glasgow to fulfill a rush order. It came back by the next steamer; and further orders for it dwindled to nothing.

It was a ship's captain who discovered that the peat tar was an excellent anti-fouling grease for ships' bottoms. Samples were

BRICKS, PRINTING, WHISKY

800 tons and had a steam-driven winch. The slip has also vanished—except for the name of the Patent Slip Wool Mills, which produce Harris Tweed.

Other small industrial activities in the island during the nineteenth century included the business of Alexander MacPherson, chemist, druggist, stationer and printer, who set up in Stornoway in 1842. He brought across the Minch with him Lewis's first demy-size hand printing press, which was still in use on 1 January 1889 to produce the first issue of the short-lived *The Lewisman*. Copies of this earliest Lewis newspaper can be seen at Stornoway Public Library. Early in the 1890s Thomas Nicolson also set up as a printer.

Whisky was once an important product, not only for local consumption, but also for export. One of the Privy Council's main indictments against the islanders in the Hebrides in 1622 was that they seized any cargo of wine and spent 'bothe dayis and nightis in thair excesse of drinking'. The council therefore enacted that masters of vessels sailing Hebridean waters should carry no more wines. It has been suggested that this and other measures were responsible for the beginning of illicit distilling, which in Lewis continued overtly as late as 1827. One of the two principal stills established by Lord Seaforth in the island at that time was at Coll, a few miles from Stornoway, the other at Grese, a few miles farther on. Such was the fame of these stills, both for output and quality, that it was hard to choose between 'Coll' or 'Grese'. Sometimes, the product passed as an article of exchange in the island, and the factor received a reasonable part of the rents in it instead of money; but the stills were closed about 1870. The *Inverness Courier* of 14 November 1827 remarks virtuously: 'Owing to the vigilance of Captain Oliver, of the Revenue cutter "Prince of Wales", and the new Excise Officers on shore, smuggling is so completely put down in the Long Island that there is actually not a drop of illicit whisky to be got from the Butt of Lewis to Barra Head; and there is probably at this moment a larger supply of legal whisky from Greenock for the supply of Stornoway alone, than was ever imported into the Hebrides before.'

STORNOWAY

701 men served in the various regiments at the front in South Africa, and over 300 in the Royal Navy.

In 1796 there were sixty-seven slated inhabited houses in the
#175 burgh, twenty-six of which had been built since 1784. Before this
632 date most of the houses followed the constructional pattern of
[362] those found in rural Lewis. In 1838,

Stornoway was, within the last twenty years, only a small fishing village; but from the spirited and patriotic exertions of Lord Seaforth, the proprietor, and the grant of irredeemable feus for building, it has become a place of considerable importance as a fishing station. It has a post office; and a packet sails regularly
[205] once a week with mail and passengers. No place in the North of
[305] Scotland, and in an insulated situation also, has made more rapid strides at improvement, both in a domestic and commercial point of view, than Stornoway.

COMMUNICATIONS

#175 Mention of the sailing packet indicates the tedious manner in
295 which mails came to the town for subsequent distribution in the
632 island. Letters went by mailcoach north to Dingwall, thence by
[564] mail-gig west to Achnasheen. Because there was no road from
[189] Achnasheen to Poolewe, about thirty miles away, they had to be carried on horseback. The weekly sailing packet then picked up the bags, for which cargo the owners were paid £150 per annum. A letter from London to Stornoway cost 1s 5½d; the smallest enclosure made it double that amount. The mail-packet was often held up by bad weather. It was a wind-blown sailing ship that brought Stornoway the result of the Battle of Trafalgar and the death of Nelson, an event which a number of Lewismen also took part and died; in St Columba's churchyard at Eye there can still be seen a Trafalgar officer's gravestone. A fortnight after this news arrived, the packet from Poolewe brought its stale message.

In 1844 seventy boats, ranging from 15 to 150 tons, were work-
#175 ing out from Stornoway. The *Gazetteer for Scotland* for that year
632 says, 'The grand trade of the place consists in the exchange of
[501] the produce of the fisheries and the kelp shores, for British manufactured goods and foreign produce.

STORNOWAY

The previous
#175 building was only an idea in 1897; it took
635 shape when Dr Andrew Carnegie offered to contribute £1,000
217 towards the construction of a library, provided the town adopted the Public Libraries Act. This was done, and the Council decided to incorporate the library into a larger structure, erected at a cost of £11,000 and opened in September 1905 by Lord Rosebery. Carnegie increased his contribution to £3,500, with other large donations from public-spirited industrialists of the time (eg Coats of Paisley, who also financed school libraries in the island).

Being a seaport, the sea has been basic to the town's livelihood.
#175 In the eighteenth century trade flourished between Stornoway
632 and the Baltic, Scandinavia, Holland, France and the north of
[244] Ireland; and in the first half of the nineteenth century, fish was
439 exported as far away as ports on the Mediterranean. The advent
#175 of steam killed the Stornoway sailing craft. At one time in its
295 history, the shipyard (at Matheson's Patent Slip, now the site of
632 the textile mill) turned out many fine vessels. The scent of tar
[272] and pitch, the crunch of a busy grindstone, the shaping of a ship's timbers, the steaming of her planks, the driving of pins and bolts, the music of mallet and caulking-iron, the buzz from the saw-pits and the riggers aloft, all gave the town a sense of at-one-ness with the waters in the bay. Then there were the schooners, brigs and barques of foreigners who put in for repairs or for merchandise. It was a time of glory that has now gone as surely as the sail has disappeared from the high seas. Ship-masters, ship-owners and
[142] sailors all added colour and variety in the streets as they mingled with the local population—which numbered 1,000 in 1801. Stornoway captains were world-known for their skippering: MacLeods, MacIvers, MacKenzies, Ryries, MacLeans, Morisons, Allans. These were the names that were once reeled off to be paired with the famous ships of the day: *Sir Launcelot*, *D. L. MacKenzie*, and *Assaye*.

#175 While large numbers of its sons were sailing the high seas, many
501 in ships of Stornoway origin, the town began to take on the first
[427] look of a port, with piers. On 9 August 1866, Sir James Matheson
632 subscribed the instrument which took the Stornoway Harbour Commission into being. The following year, on 29 June 1867, the island's factor paid £6 stone of 24 lb for black feathers;
[237] and 5s per stone for grey. For these he received, in Edinburgh or

THE OTHER ISLANDS

#175 even to the extent that the St Kildans used their observations of
18 the flights of birds both as compass and as omen for good or evil.
[826] Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naively at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who find the sweetest fruit of true liberty.'

In May 1877, when the local tourist trade had hardly started,
[27] HMS *Flirt* sailed from Greenock with food to relieve hardship
[26] among the people. Aboard was an officer of the Highland & Island
Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island con-
[260] sisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or puffin and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from
[272] March onwards, also formed a staple food. Tea was taken once or twice a week, and the islanders were reported to be 'the heaviest tea-drinkers of all the people in the world'. Yet the people are not a devoid
[340] of it'. There were eighteen inhabited houses, sixteen of which had thatched roofs. The sixteen new cottages had been erected in the year before the *Flirt's* visit, with assistance from the
[372] Western Isles'. All were well furnished, peat was used for fuel and
[405] there were two watches and one clock on the island. There were some seventy-five islanders; most of the men were old, and only
[162] two of them were unmarried, with twelve spinsters still to choose
[216] from. It read like Gaelic Bible. The men were mostly tailors, shoe-
[142] makers and weavers; every house had a loom. They made all their own clothing, the men also making the women's dresses,
[205] and a good deal of blanketing and tweed cloth was made and sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each
[362] croft and house was rented at £2 annually, sheep being charged
[427] for at the rate of 5d per head; these charges were usually paid in kind.

439 Feathers of the sea fowl formed the principal export of the
#175 island. The factor paid £6 stone of 24 lb for black feathers;
[237] and 5s per stone for grey. For these he received, in Edinburgh or

ST KILDA

Glasgow, between 7s and 10s per stone. For tweed made on the
439 island, 27d to 30d was received per yard; for blanketing, 28d. Ex-
435 Cloth was measured by the 'big yard', which was 49 inches. The factor bought cheese at 78d per stone of 24 lb. The prices paid by the islanders for commodities imported included 25s per boll for meal and oats; 3s per cwt for salt; 7d for coarse sugar; 5s per lb of tea; whisky cost 4s per bottle; and tobacco was 5s per lb. Leather for soling boots cost 24d per lb; for uppers 27d.
Bonnets for the men were 4s each; cravats, 3s. Physically, the
142 islanders were in good condition at the time of the *Flirt's* visit, with an average height of 5 ft 6 in, though they showed a tendency to flabbiness. The prevalent illness was rheumatism, with
164 dyspepsia running a close second.

314 Historically the gneisses were of little value. The fact
[174] that they tend to split still helps the Islander in building,
[174] as it helped his ancestors when they raised the great stone
[135] circles at Callanish on East Loch Roag. Except where they are very basic (non-acid) in composition, they make poor soil. Yet the gneisses are not quite devoid
of economic minerals, which include masses of pegmatite, and the only large body of anorthosite or lime-feldspar
[139] rock in Britain, conceivably a source of alumina for glass manufacture.[1] Two feldspar quarries opened at Lingarbay
[178] and Northton in South Harris in 1941 employed sixty men during the war, the mineral being despatched from Leverburgh for use in the Staffordshire Potteries in the manufacture of porcelain insulators. The higher grade mineral
in Scandinavia and the better transport facilities there led
to closing the quarries, with little hope of their reopening.[2]

ISLAND, WORK AND PEOPLE PT. I

133 most northerly outlier, yet, in the main, one is struck
not by the variety of rocks (except for the 'Stornoway
Beds') but by their homogeneity. It is structure, causing
the uplift of certain masses relatively to others, more than
differences in rock-type, which has guided the work of
erosion, in sculpturing both the Island's plan and the
details of its forms. Subsurgence of the land has fretted
the coastline into a zigzag line of ridge-capes alternating
with valley-mouths flooded or 'drowned' by the sea, as
inlet and loch.

Historically the gneisses were of little value. The fact
that they tend to split still helps the Islander in building,
as it helped his ancestors when they raised the great stone
circles at Callanish on East Loch Roag. Except where
they are very basic (non-acid) in composition, they make
poor soil. Yet the gneisses are not quite devoid
of economic minerals, which include masses of pegmatite,
and the only large body of anorthosite or lime-feldspar
rock in Britain, conceivably a source of alumina for glass
manufacture.[1] Two feldspar quarries opened at Lingarbay
and Northton in South Harris in 1941 employed sixty men
during the war, the mineral being despatched from Lever-
burgh for use in the Staffordshire Potteries in the manu-
facture of porcelain insulators. The higher grade mineral
in Scandinavia and the better transport facilities there led
to closing the quarries, with little hope of their reopening.[2]

#175 rent averaging 31s., in addition to which there were over
473 1000 houses of the cottar class and 300 houses of the
squatter class.[1]

Lastly, Sir James trained no successor to follow up or improve upon his experience. At his death in 1878 Sir James was succeeded by his widow, and, nearly twenty years after, she was followed by a nephew and his son. But the expenses of Stornoway Castle and its burdens, accompanied by lower rents, weighed down the new proprietors.
[228] In 1918 the estate was sold to Lord Leverhulme, who shortly afterwards purchased Harris too, with a view to his great schemes of fishery development.

(c) FISHERIES: 1750–1914

#175 For the greatest expanding industry of the northern
295 coastlands, Matheson had done comparatively little even
471 at Stornoway. In 1885, a former Factor (Mr. Mackenzie
228 of Calgarry) stated that he had constantly asked for aid to the fisheries, especially by the building of harbours, pointing out that the landlord would reap benefit in rent.[2] But Matheson had replied that the fishermen and fishcurers, the people engaged in the trade, should do this themselves. By the end of the century, harbours were being planned and built with State aid in the north, west
[439] and south-east of the Island (at Ness, Carloway and Uig, and Tarbert, Harris). In 1900 the Islanders possessed
150 herring boats, and in that year five boats from the Stornoway District sailed for the first time to Yarmouth,
[511] and two to Lerwick. For the next dozen years there
[113] were 'Cod Bages, Well *for anything could be counted upon*'.[3]

CH. IX ECONOMIC CHANGES: 1750–1919

COMMUNITY FROM PAST TO PRESENT PT. II

121 1794, for instance, their crews not only fishing but also
#175 buying from local fishers. Islanders occasionally earned
228 a pittance as pilots, for until the charting of these rocky coasts navigation was most dangerous.

The herring industry was in the hands of 'adventurers'
175 (who 'ventured' their capital), and the Islanders benefited
228 little. The British export was aided by a bounty which
[177] helped to capture the Continental market; but, as Adam
[439] Smith pointed out, no bounty was given to the small open
boats suitable for the north-west lochs. Thus the operation
175 of the Salt Duty after 1707 and of the bounty system from
228 before 1745 until 1786, illustrates two of the recurrent
[62] blights upon 'Public Administration' in the Isles. As Day
[654] wrote, their interests have had to suffer "either deliberately, for the benefit of other parts, or other classes in the kingdom, or inadvertently from ignorance".[1] Although the bounty system was widened to include small boats after
1786, the Islanders remained until 1817.

To overcome difficulties, the British Fisheries Society
was founded with Government support in 1786. Although
Stornoway then seemed too far afield, the Society's concen-
[618] tration upon Lerwick settlements foreshadowed Lord Leven-
[311] hulme's principles after 1918. At Ullapool, Tobermory
and Lochbay (Skye), and at Wick, quays and stores were
constructed and dwelling-houses built, with croft land and
grass for a cow, to be reclaimed. Although concentration at
Wick led to the sale of the three western properties about
1842, the Society had done some good work in the West.
The chief difficulty of the West Coast north of the Clyde
area and south of Stornoway District remained: the lack
of a well-marked seasonal migration of herring.

[1] W. C. Mackenzie, 1919, p. 65 ff.

The chief difficulty of the West Coast north of the Clyde
area and south of Stornoway District remained: the lack
of a well-marked seasonal migration of herring.

[1] J. P. Day, *Public Administration in the Highlands and Islands of Scotland*, 1918.

175 From the Napoleonic Wars to 1914 the amount of
228 herring cured on the West Coast of Scotland rose and fell.
In 1810–14 the East Coast cure was half the West Coast
251 cure, but the peace of 1815 brought the capture of the
458 Continental markets and the East Coast herring export
leapt up. It averaged 500,000 barrels from 1850 to 1870,
a million from 1880 to 1900, and one to two million barrels
[439] until 1914. With the decline in the export to the Planta-
tions, the West Coast export fell, to rise by 1890 and reach
a peak from 1900 to 1914. Thus, although no more than
from a tenth to a fifth of the East Coast yield, that of the
West Coast had risen greatly.[1] Of this, the Stornoway
cure formed the major part.

175 The chief early type of catch, of white fish (cod, ling
228 and hake), was developed too, and swelled to a peak by
1900, then dwindled and fell. The average Stornoway
District catch of white fish for a dozen years to 1900 was
valued at over £100,000, much of it caught by local boats,
and some of it cured at small 'creeks' (*e.g.* on the west of
the Island, on Loch Roag, notably at Carloway). The
cure, a strong coarse food, was shipped to Ireland and the
Clyde; but after 1900, fresh trawled fish replaced the
cured. From £100,000 before 1900 the value fell to little
over £10,000 in 1912–13, £1000 in 1920, and half that in
1921—½ per cent of the value in 1900!

[471] Thus the herring fishing became the most important
[452] to the Islanders, at first by employment on East Coast boats.
[652] Later they purchased boats and gear for themselves, helped
principally by advances from Island and East Coast curers,
though also by State loans.

[1] *Fishery Board for Scotland*, Table 25 (1938), and Table 23: 6000 barrels in 1790–95; 80,000 in 1870–75; 100,000 in 1912, and 160,000 in 1913. For fair comparison with Table 25, about 25 per cent should be added to quantities, as explained in the notes to the Tables, on the 'seastick', and final reduced, or 'bungpacked', state of barrelled herring (listed in Table 23).

464 For a year or two after the war many men and women
[288] returning from the Services, the sea or the factories found
employment in the flourishing Harris Tweed industry.
[729] This included work in the spinning mills and hand-weaving
at home—work in which the male weaver was helped by
his family in jobs such as bobbin winding. Few fishermen
[226] dared to sink capital in new boats and gear, and risk losses
[178] such as those sustained after 1920. Few women wished to
return to the hard, uncertain work of gutting. The whaling
[462] station, built on West Loch Tarbert before 1914 and open
for a short time between the wars, was reopened in 1950,
and employed some 30 men for 18 months before it closed
[241] in 1952. Crofting was lightened by some mechanised
[722] cultivation. The war-time construction of air-fields had
ceased, though some harbour-work and road-making was
[654] assisted by government grants.

In 1949 the Harris Tweed industry, now the Islanders'
288 main source for earning, was crippled by the imposition of
651 a 66⅔ per cent purchase tax on hand-woven Harris Tweeds.
Parliament decided that as a non-utility product, its export
648 sales alone could be exempt from tax. Viewing the
[433] position of the tweed industry in Britain as a whole, there
were strong arguments for the extension of the tax to
[171] Harris Tweeds: the high-grade industry of the Scottish
Border or the manufactures of the West Riding should not
be subjected to unfair handicap. At the same time the
crippling of a handicraft practised by peasant or artist
favours mass-production to the loss or ruin of traditional
and experimental workmanship or design to which, in the
end, the mass-production is an unacknowledging debtor.
The obvious economic handicaps of Island hand-weaving
[439] may surely permit some latitude. The export trade in
[458] Harris Tweed, in which the imponderable 'sentimental

288 value' is important, is an appreciable dollar-earning asset;
651 and because of the fluctuating export market, its manu-
648 facturing must be stabilised by sales at home.

[439] These and other facts support the plea that if some
[458] share of taxation had to be imposed in the national interest,
it should have been done by steps to permit of readjustment
in manufacturing and of adaptation to the carefully fostered
market. What seems indefensible, even in the national
interest, was the imposition of the full 66⅔ purchase tax.
As a result of this blow, the crofter's web could not be sold,
and lay, a prey to moths, in his home, while the mill-
owner's stock piled up in the warehouse. 'Hand-looms',
newly bought or partly paid for, lay rusting in the sheds and
the machinery of the mills stood idle. The hand-weavers
with their helpers and the employees in the mills, their
savings spent, began to seek work beyond the Island. As
[161] the census of April 1951 has shown, the population has
been falling as workers trickled away by every steamer.
Some adjustment was made, it is true, late in 1951; but
the case of the small independent weaver remained as hard
as ever.

288 The amount of tweed stamped with the Orb Trade
433 Mark, which diminished slowly from 4,464,000 standard
yards in 1948 to 4,101,000 in 1949 and 3,780,000 in 1950,
[651] fell when the tax was imposed to 2,800,000 in 1951. In
1952 there was a recovery, maintained in 1953. Over
5,000,000 yards will have been stamped in 1954.

APPENDIX II

(iii) *Fishing Industry* (1953)

The renewed Russian contracts for herring have meant loading of Baltic shipping at Stornoway with barrels of herring cured both in Stornoway and Ullapool. Catching power in Scotland generally is hardly enough to meet this contract. Thus, while the numbers of boats continued to decline after the war, leaving only one steam and 33 motor drifters (over 30 feet keel) registered by 1953, the fishermen employed rose to 610, of whom some 520 were crofter-fishermen. Many worked much of the year; on the other hand, most of the winter catch went for 'oil and meal' at about 50s. per cran instead of the top price of over 80s. For local boats a figure of £30,000 is suggested for the catch of herring, say £10,000 for white fish, with £5560 for shellfish. For "curing and associated income" the pre-war figures may be doubled.

(iv) *Other Sources of Income earned in the Island* (1953)

In mid-1953, of just 5000 registered for the Island as employed—and other than the self-employed, *i.e.* the farmers and crofters, the hand-weavers and the boat-sharing fishers—1130 earned by the three industries first named, the rest by other trades and professions, 3870 in all. The unemployed numbered 1180. Analysis of wage-rates would throw light on total earnings. As to unemployment, the fact that, like crofters and many fishers, hand-weavers count as 'self-employed' means that when out of work they are not covered by unemployment insurance, and have to be helped, at low rates, by public assistance.

(v) *Allowances, etc.* (1953)

Turning now to Remittances, to the manifold categories of Pensions, National Insurance and National Assistance, and to Unemployment Benefit (a small item), the Table B, 1953–54, shows the totals kindly furnished for this study, with £1,017,110 for all Lewis and an estimated £977,010 for rural Lewis.

here and there in small patches of less than a quarter acre and therefore do not appear in our summaries, appendices A (i) and C (i).

The amount of cultivation carried out depends on three factors:

(i) stock, particularly cattle, to be carried through the winter,
(ii) size of family, which influences the amount of potatoes grown,
(iii) available labour, because cultivation is mostly by hand, especially in South Uig and Bernera.

The size of the effective agricultural unit has little influence on the area cultivated although it may bear some relation to the amount of natural hay taken. This can hardly be regarded as 'cultivated' and the acreage is difficult to estimate; the custom is to cut as and when weather permits, and wherever there is a convenient stand of natural grass.

Hand labour is a necessity on most crofts in the Bernera district and on many elsewhere. The traditional 'lazy-bed' - a long narrow strip of cultivation bounded by deep ditches which may be half as wide as the bed - is a necessity on broken, rocky ground on which the only soil is peat which often has to be gathered into hollows in order to get sufficient depth. The small size and long narrow shape of most crofts do not lend themselves to tile drainage, which is almost unknown. If it could be extended it would be a great advantage but, in general, it would have to be organised by townships, or at least by groups of crofts, and the whole trend in management of croft land is towards individual occupation and use.

This may not always be a good thing. Fencing is a case in point. Until the last ten years fenced crofts were rare although small parts of crofts might be fenced and, in some cases, a group of crofts might be fenced off from the rest. But, in general, the crofts were common land in the winter and used individually only from May to October. Fencing grants, and the encouragement of sown grass in rotation with oats, have changed this. A great rash of fencing is appearing. This may not be altogether a good thing, particularly for the sheep in winter and spring; even if gates are still left open, stock are deprived of the ability to move for shelter. There may also be watering difficulties. Co-operative draining, cultivation and grazing, of groups of crofts if not of townships, would be more efficient and more productive.

Finally, we may remark on the curious insistence on hand cultivation of oats and potatoes for consumption on the croft, whilst cash crops well suited to hand labour, and which would be far more rewarding, are neglected. Flowers, vegetables and potatoes are imported into Stornoway daily on the mail steamer and even by 'plane. Neither climate nor soil prevents their production in Lewis. Moreover such crops could provide a much needed source of additional income. A few croft gardens produce excellent soft fruit and as the local season differs slightly from that on the mainland there would seem to be possibilities here, too. There have been virtually no agricultural innovations since the potato.

Economic and Technical Factors.

The agricultural income of a croft arises from:

(i) the sale of livestock, mostly store stock at the spring and autumn sales,
(ii) the sale of the annual wool clip,
(iii) the receipt of certain annual subsidies and grants.

These are the main items; in addition some may sell small amounts of potatoes, eggs and standing hay; a very few sell a little milk although strictly this is illegal. Such an annual income comes in three or four annual instalments, uncertain as to date and amount. Moreover, a crofter may suddenly and unexpectedly find himself deprived of a large portion of his income due to casualties amongst his stock or poor demand at the seasonal sales. Unlike the mainland farmer, should an islander withdraw his store

cows. In the spring they were turned loose on the moors. identification their owner either cut their ears or burne horns with a hot iron.

As soon as possible after the spring sowing, the st was moved to the rough grazing lands. Although there is evidence to suggest that the sheiling (from the Norse ske life formed a part of the annual routine, its later impor makes it plausible. Rude huts of stone or timber were er in the higher mountain pastures to which the cattle were by the people of each farm. In the sheilings the women c for the stock and spent their time making dairy produce. the young men and women it was a time for courting. The bodied men must have taken only a limited part in the she life; they were kept occupied with other duties.

The Droving Trade. The chief industry of the Skye was th cattle trade with mainland Scotland and, after the Union 1707, England. As early as 1502, "marts," surplus cattle off in the autumn, were being exported from the barony of Trotternish.[66] By the middle of the century, the Highland had grown to such proportions that the Privy Council was to enact measures for the preservation of order at the mar At the close of the sixteenth century, a MacDonald chief h established a regular trade in cattle and ponies between t Outer Isles, Skye, and the east coast of Scotland. By the time of the Union, Skye had become the largest producer of

[66] For details on the droving trade, see A. R. B. Hal The Drove Roads of Scotland (Edinburgh: Thomas Nelson and 1952), pp. 2–35, 66–63.

175 439 to import grain to feed his clansmen.[72] Other local exports included wool, hides, tallow, furs, goats, sheep, butter, cheese, and "Skye Champagne" (whiskey).[73] How the trade was carried on is uncertain. In 1630 it was said that the inhabitants traded with Glasgow, but a navigator's handbook written in 1599 asserts that the lack of trade with the Hebrides was due to the ignorance of most navigators about the seas.[74] By 1695, all the previously mentioned products were being sold or bartered at the semi-annual fair at Portree.[75] No doubt the drovers were bringing in various mainland goods. There were also some peddlers from Morayshire who had settled on Skye and travelled through the islands.[76] In 1750 a government officer who visited the island claired that until 1700 the people had ferried their exports across to the mainland at Glenelg and then went by horse to Inverness where they obtained their merchant goods for the year.[77] Trade by sea with Glasgow was said to be relatively recent.

175 224 Fishing. In terms of subsistence, fish were more important to the Skye folk than their stock.[78] The seas, lochs and rivers

While the process of commercialization proceeded against the persistent efforts of the people to maintain their tradition al way of life, events in Great Britain were beginning to have a pronounced adverse effect on the local economy. The end of the Napoleonic Wars brought the cattle boom to an end. Although the droving trade remained brisk, the value of the stock declined markedly.[37] An increase in the number of cattle on the grazings, as a means to maintain an economic equilibrium, was impossible. The island was already overstocked and had been devastated by this practice. At the same time, development of large scale commercial farming in the Lowlands had encroached on the right of way of the drovers, and the Skye cattle were suffering at the markets from competition with improved, better nourished breeds from the northeast and southwest. The end of the wars also witnessed a decline in the kelp market.[38] Parliament finally completely undermined kelping by recurrently reducing the tariffs on foreign substitutes.

175* 178* 248 231 439

The crofters, who had suffered rackrenting to get their small strips of arable, found themselves without the means to pay the rents which had been set at the peak of the cattle and kelp markets and without enough land to meet subsistence needs.[39] The striking thing is that in spite of increasing economic hardship, the population continued to grow. They became hostages

175* 178* 427 233 166 167 425 162 [167] squatters without any legal hold on the land. In Duirinish parish, which includes Glendale, only twenty-one families had enough land to meet even subsistence needs.[62] In one Glendale township, Holmisdale, some crofts of four or ten acres had as many as fifteen people to support.[63] Part of this extreme congestion was due to the continued practice of subdividing one's croft when a child married. Although the population in 1831 had fallen to 17,680, from 23,084 in 1841, almost every township had two or three times the number of families which had lived in them in 1841.[64]

175* 178* 427 233 241 437 263 452 [272] 942 442 The loss of the summer shielings and the common grazings meant few could keep sheep.[65] The looms were silent. Since the rent continued to be based on the value of livestock and was wholly or partially paid from the sale of cattle, all oats, which the graziers' sheep did not eat, went to feed the cattle. The mills were all but idle. The people had to buy flour, meal, and bread imported from Glasgow. Almost all were heavily in debt to the local merchants, who seem to have been newcomers with more associations with the graziers than the crofters and cottars. Milk became a precious commodity. Frequently, the old cow had only enough for her calf. Unable to keep horses, the women became beasts of burden. They carried

from these influences. Now the government provided the capital, by grant, subsidy, and loan, and the guidance necessary for a fuller utilization of the land. The crofters who had already seen their subsistence economy disappear became a part of the national system of commerce. What effect have these influences had on the culture?

175* 178* 189 241

Throughout the modern epoch there has been a tendency to increase the production of exports, first cattle and then sheep, at the expense of the traditional subsistence crops. Within ecological limits, the national markets have determined what the Sgiathanach might produce. Since the environment has made Skye a pastoral land and agriculture is a poor risk in the best of years, abandonment of a subsistence economy has meant dependence on stock breeding for export. Commercialization of the land and increasing dependence on imported food has resulted in a growth of the importance of money. The decline in household industries, caused by economic deterioration, has also played its part in the people's dependence on currency. As a measurement of values, however, the importance of money has declined since the period of the large sheep farms. The crofter's margin of profit is small, and his opportunities to earn a wage are limited. Economic differentiation no longer affects the traditional status values, except within the traditional polarity of landed gentry and tenant.

129* 178* 439 175* 178* 439 436 [55]

In a comparable way, the utilization of more efficient methods of production is less important now than it was during the period of the "Clearances." Techniques have improved for the majority in so far as labor saving devices are available, but the achieving of modern efficiency is precluded by the

TABLE 2

ESTIMATED VALUE OF AGRICULTURAL PRODUCTION ON THE ISLE OF SKYE

Produce	Total Marketable Production[a]	Local Consumption[b] (Household & Croft)	Exports
Oats	£ 3,500	£ 3,500	£ ....
Potatoes	23,500	23,500	....
Turnips	2,000	2,000	....
Hay	24,000	24,000	....
Sheep and Lambs	70,000	20,000	50,000
Wool	50,000	10,000	40,000
Cattle	90,000	20,000	70,000
Milk	30,000	30,000	....
Poultry and Eggs	40,000	40,000	....
Pigs	6,000	....	6,000
Miscellaneous	5,000	5,000	....
Totals	£344,000	£178,000	£166,000

[a] Based upon assumed yields from crop acreages and stock reported to the Department of Agriculture for Scotland.

[b] Consumption includes an allowance for loss of stock.

241 the economy by subjecting many fertile acres to disuse because
427 of his infirmity. The other factor is the absentee tenant,
247
828 an individual who has obtained possession of a croft, normally
311 by inheritance, but who has failed to take up his inalienable
[128] rights of tenancy. Let us very briefly review the economic trends of the last fifty odd years and, then, try to assess the importance of the absent and the aged.

436 Although the Sgiathanach has refused to become a
433 specialist, fully involved in a money economy, he has become
241
178 increasingly dependent on the products of the wider commercial
439 society. Long ago he gave up growing the old staples, barley and oats. Not for many years has he grown enough potatoes or turnips to feed himself and his cattle. In place of these home grown subsistence crops, he now imports a great deal of his food. In an average year Skye imports over 700 tons of bread, 10 tons of vegetables, 300 tons of canned goods, 300 tons of potatoes, 500 tons of flour, and 100 tons of milk. To pay for these products, he exports cattle, once his only marketable produce, and an ever increasing number of sheep.

436 Hance, writing about the Outer Hebrides, sees the growing
241 tendency of the crofters to buy their food as indicative of an
238
437 increasing cash income.[16] To a certain extent, this may be true. There are, however, additional factors involved. Ecological limitations have played their role. That the climate and soil together make Skye a grassland suitable for stock breeding rather than an island fit for cultivation is an often repeated

[16] Hance, The Outer Hebrides in Relation to Highland Depopulation, p. 22.

436 belief. Since agriculture is a poor risk in the best of years,
241 the present tendency to use more and more of the land for grass
233
439 and hay can be regarded as a more complete adjustment to the environment. The partial involvement in the outside contractual world encouraged and made possible the change. The same reasoning applies to stock production, including the declining number of horses, cattle, and, especially, dairy cows. The exports, obviously, reflect market demands. A couple of [242] crofters have unsuccessfully tried market gardening. The Sgiathanach is not a vegetable eater, and the commercial establishments, apparently, find a more dependable supply
436 elsewhere. A few crofters do sell potatoes in Portree, but
241 they will not compete with the large, east coast potato
432 farmer. In 1953, as soon as the price fell below the pre-season high, the crofters decided it was not worth the trouble
437 to dig the tubers for sale. The same held true for eggs.
436 Many crofters barter eggs with the food vans which serve the
235 rural areas for tea and meat. When the Scottish market was glutted in the summer of 1953, the crofters refused to trade at lower prices. They preferred to obtain their protein from the eggs, believing that the spring egg prices were the fair prices. For the sake of emphasis, I repeat, the involvement of the Sgiathanach in the world of commerce is only partial. Finally, in accounting for these changing economic trends, the aged and the absentee crofter must be taken into account.

887 The old people frequently cannot work their crofts or
241 cannot use them fully. The age at which the work becomes too

The factors which brought about centralization of the industry 228
in Scotland, including commercialization, availability of credit, access to markets, and local populations ready to specialize,[25] have also operated locally. The number of West Highland fishermen has actually increased, but the increase occurred at a few centers. Skye, like most of the region,[26] [504] has numerous isolated coves but no harbor adapted for commercial fishing. Further, the changes in the economic pattern have severed the former relatedness and consistency of fishing with pastoral-agriculture. Moreover, fishing today, to be remunerative, has to be diligently followed. It must be a specialized occupation. The Sgiathanach has not been able to make the adjustment necessary to become a full-time fisherman.

Of the 182 townships on Skye, fishing is important in 98.[27] In a few of these townships fish are an export item. [439] There is no longer any fishing done in eighty-four townships. Portree, with its sheltered bay, is the base for a few full-time fishermen who sell locally. Uig Bay, Loch Pooltiel, and [504] Loch Bracadale, all once considered excellent harbors, are neglected. The lack of fishing in Loch Bracadale is striking. It is there that sixty families of Harris crofter-fishermen were settled and purposefully given small crofts with the expectation that they would continue to fish as they had on their native isle. They never tried exploiting the inshore

44

44 MARKETING--general statements dealing with several aspects of the specialized elaboration and promotion of trade. For the mechanisms and volume of trade see 41; for its financing see 45; for business organization see 47.

463 One of his
326 apprentices was his sister's son, who built another
[804] smithy not far away. "This was the center of gossip.
[604] People gathered there while he shoed horses that came
[521] from Barvas to Carloway."

444 A number of shops were established in Shawbost
198 that sold clothing, cooking ware and groceries. At
[494] one time they numbered six altogether. These shops also ran the first buses between the village and
[497] Stornoway. Gradually these businesses disappeared
[443] because of competition with larger companies. Mobile grocery vans and butcher shops and bakers began coming in the late 50's, and gradually took over the trade in large parts of the island, undercutting the local businesses. Income from weaving had already weakened self-
198 sufficiency derived from the intensive use of land and
434 sea and also weakened the formerly heavy reliance on
57 local ties and mutual aid. Today an army of town-
621 dwelling entrepreneurs and employees constitute a major
439 proportion of the traffic on the island roads. Grocers,
463 fish dealers, bakers, sellers of soft drinks, garbage
178 collectors, insurance salesmen, mobile banks, coal
[872] dealers and others extend goods and services from
[484] centralized sources to a market which has money to pay for them. The island's participation in this extensive market system is affected by its marginality to the

(c) THE OUTLOOK: 1939–54 AND SINCE

458 How then can the situation be assessed, as it was before
the outbreak of war and since then? By 1939 twenty years
178 had been partly lost; for the after-war years of the 'Lever-
hulme boom' were followed by discouragement and
poverty. During that time one might have hoped for half
[423] a generation of reconstruction and progress. On the other
hand the sore question of dividing the farms was settled,
so bringing raiding to an end. Congestion on the existing
crofts is less than it was, owing to this fact, and to the
[166] provision of feus. The poverty of many breadwinners
who had migrated to the cities first cut down the amounts
remitted to their Island dependents, then drove them home.
[433] A croft, or even a garden site, and the opportunity of
building a good house there made life still worth while,
[746] when other employment had failed. Unemployment
relief, though tempting some to idleness, gave a respite
[286] which many utilised to make a fresh start. As fishing
waned, many had taken advantage of the easy beginning
[226] offered to learn a new trade—weaving. This has made
many feel that the living to be found on the Island is
better than alternation of 'wage-earning' with unemploy-
ment, in Glasgow or abroad. They believe the situation
[311] of the Island community to be hopeful. While the land
remains little better than before, many, even of the younger
people, still care for the Island life among their own kin.
Given a clear lead, these could reorganise themselves, and
undertake the developments needed in fishing, weaving
and reclamation. The homes are sound, 'good neigh-
bourhood' endures, and given fresh opportunity, the
community could awaken to new life.

178 During and since the war, co-operative marketing was
• 44
476

178 developed through the township Grazing Committees by
476 the Scottish Agricultural Organisation Society and its
• 44 associated Crofters' Agency. Lime and fertilisers were
(654) purchased, and wool and other products sold, co-oper-
atively. The co-operative marketing of lobsters, taking
[228] advantage of fluctuating London prices, has led to the
reconstruction of ponds for storage. By these and other
[654] means, government assistance is utilised but not squan-
dered; earlier initiative in agricultural organisation is
reinforced; and communal tradition is revived, linked
to personal responsibility through the crofters' lifelong
knowledge of one another.

178 As to the future, all agreed that unless the Harris Tweed
288 industry flourished, with work at reasonable wages, the
villages would be abandoned by the young, perhaps with
[829] no return such as hitherto on 'retirement'. Many young
people are content with life in the townships, provided
they can get a living there, though not all, for they are
somewhat divided; and work elsewhere, even in the mills
of Stornoway, is a counter-attraction.

178 Social life is undergoing changes which operate both
597 for and against the retention of the young. On one hand,
538 household interchange of conversation, song and story,
the *ceilidh*, has declined. On the other hand, one found
178 that, as regards religious prohibitions, and in spite of the
771 nervous tension expressed in 'Revivals', the young have
577 won greater freedom. Near one village a Nissen hut,
handed over to the Home Guard, was also used by young
[535] people for monthly dances. When I asked a young crofter
invalided from the Navy whether the Elders of the Kirk
made no protest, he replied that they had, but had to give
it up: "They see that we won't stand for it"! This
would have been unthinkable during the First World War,

441

286 195 731 735 of potato crops by blight had contributed to widespread poverty. The production of cloth for non-local markets 286 195 741 439 was promoted initially by philanthropic proprietors in an effort to ameliorate such conditions. Lady Dunmore, of the Dunmore family that owned Harris during most of the 19th century, was largely responsible for developing a market in London and elsewhere for cloth woven in Harris. [565] The cloth was popular first among the aristocracy, who [438] [435] wore it for hunting and other sporting occasions. The romantic image of a cottage industry promoted for charitable purposes contributed to the market value of the tweed.

The market expanded in the second half of the 19th century, aided by ladies of leisure who followed the example 286 441 175 [764] set by Lady Dunmore (cf. Hunter 1964: 24-26). The production of cloth for a commercial market spread from Harris to the southern isles, but was slow in coming to Lewis, where the proprietor, Sir James Matheson, provided the people with construction jobs. After Matheson died in 1878, weaving for outside markets began in Lewis in the parish bordering Harris, and the name "Harris Tweed" was used because a market for cloth of this name had already been established. By World War I, weaving for outside markets was being done in all four parishes in Lewis. In 1899 there were 55 looms in Lewis and over 200 in Harris.

286 441 175 By 1911, the number of looms in Lewis had increased to 250-300 (Hunter 1964: 42).

[288] [184] By the late 19th century small mills had replaced domestic spinning and weaving in the Highlands on the mainland. Weaving continued to be a home industry in the Hebrides where it was encouraged by the support of non-profit-making organizations such as the Highland Home Industries and Arts Association, the Scottish Home Industries Association, and the Crofters Agency--all established at the end of the 19th century--and also encouraged by local merchants who had begun to act as middlemen in marketing the cloth. These merchants owned small general stores throughout the island and either bought the tweed from local weavers or gave them goods from their stores in exchange. Many of the tweed firms in Lewis grew from such small general stores and from the barter system.

288 175 159 472 1. The Harris Tweed Industry in Shawbost: Coinneach Rod, a man who started a tweed business on the west side of Lewis which eventually developed into a large mill with equipment for spinning yarn and finishing tweeds, was said to have been a risk-taker, a man who lost the first L50 he borrowed, but borrowed another L50 and never looked back, a man who throughout his life gave fellow

288 175 159 472 businessmen nervous breakdowns because of the risks he continued to take. "He was planning to start some business. At one point it was going to be either distilling or the tweed, and he just happened to go for the tweed."

Some say Coinneach Rod had physical disabilities, developed or aggravated by military service, which made him unable to work like other men, and hence he was forced to find other ways of earning a living. He was a merchant, like other islands who became entrepreneurs in the tweed business.

According to one version of Coinneach Rod's life, he began to handle tweed on a large scale as the result of an accident, when an agent selling tweed for a merchant on the east side of the island arrived on Lewis for the first time, asked for a "Kenneth Macleod, merchant," and was directed to Coinneach Rod of Shawbost.

"He was also an earthy, natural, easy man to get on with. He never changed, even after the money came. He would sit the buyers down with a plateful of cuddies and say 'Dig in,' 'Eat up.' He always ate them whole, and never spat out the bones. The buyers liked that. They liked his easy manner."

175 441 452 Between the first and second world wars, the merchant was an extremely powerful figure. When men and women

175 441 452 went away to the fishing, their families bought groc on credit. "If the merchant thought the fishing sea would be good, he let them have as much as they want otherwise he restricted them in their buying."

288 175 159 444 437 472 The barter system continued in Shawbost long aft it stopped in Stornoway. A weaver was given credit i Coinneach Rod's store, until it closed in 1948, for t exact amount of the tweed. He never gave money. "Yo to get just the right amount of goods, even down to tuppence in matches." People were forced to buy huge jars of jam which they did not really want or need. S "cunning" fellows would slip a two-pound pair of shoes into a shoebox marked 15 shillings. "Coinneach Rod wo ask if you wanted a wireless, or would a tweed jacket i your son. You couldn't refuse, or you wouldn't do any weaving for him for a long time."

288 175 159 472 452 Coinneach Rod bought looms for many weavers, and t would weave only for him to pay off the debt. "People living on the dole with a large family would go to him and ask him to buy them a loom. He would get the man a loom, and then get him a lot of tweeds to weave so the m could pay him off. It was two tweeds for yourself and o for the loom."

288 175 441 2. Centralization and Specialization: Centralizatio and specialization in handling the production of the twee

attle in Scotland and served as the gathering place for most f the Outer Hebridean stock.

The history of the cattle trade reflects the prevailing onditions of the times. Since cattle were the main form of ovable property, they were the favorite prey in inter-clan aids. Indeed, until about 1640, the acceptance of a chief was ependent on his success as a cattle thief. Almost all clan ars began with a creach, a cattle raid. Some of these cattle ifting expeditions kept the men of Skye scuttling back and orth over the island and the neighboring mainland for years. ntil the fifteenth century, the trade was primarily based n illegal droving. As late as the seventeenth century, a ubstantial proportion of the stock brought to market was tolen. The Privy Council, fully aware of the fact that the xport of cattle and horses provided the only means by which he islanders could pay the king's duties, continuously strove o restrain illegal trade.[67] They enjoyed meager success. At est they could only name the guilty party and pass a sentence f outlawry while the offender was safe at home. The most tringent enactment was passed in 1609. It sought to compel ecvers and merchants to buy only from those answerable to the ing's laws. Skye was not included among the obedient subjects. was only after the Union that droving became a lawful, ganized trade with established markets.

---

[67]"State of the Highlands at the Beginning of the Seventeenth ntury," in Burt, op. cit., Vol. II, Appendix 1, p. 252.

*175 439 A variety of factors operated to enable Skye to become the primary Highland beef producer.[68] The emphasis on horticulture in the Lowlands and sheep breeding in the Southern Uplands, restricted the raising of cattle. The climate and terrain made the island more suitable for pasture than crop cultivation. The island had been geographically isolated from the ravages of the wars between England and Scotland, which periodically devasted the Lowlands and eastern Highlands, from the thirteenth through the sixteenth centuries, and from the internal troubles of the nation in which the clansmen played no small part. The determined resistance to the encroachment of the Crown fortified this isolation. Only rarely did the King's forces penetrate, and when they did, the islanders temporarily submitted. The clan wars had a way of balancing one another. Economic conditions also played their role. The tendency toward overstocking, coupled with the primitive methods of cultivation, compelled the tacksmen to thin their herds each autumn. The small amount of land allowed to each clansman would not support more than one or two cows. Stirks had to be disposed of and went to the tacksmen or the chief as rent and, perhaps, as payment for the purchase of necessities.

Transportation provided no difficulties. Boats had to be used to bring the cattle from the Outer Isles to Skye, but in trade from Skye the cattle provided their own transportation. Two fairs a year were held at Portree, beginning in 1693, in

---

[68] Cf., e.g., Haldane, op. cit., pp. 68-69.

une and early September.[69] The horses and cattle sold at 175*
air were moved across Skye to either Kyle Akin or Kyle 439
When the tide was fairly low, the stock were ferried
s, five head at a time. They were simply tied head to
and pulled behind a boat. Once ashore, the cattle were
n south over the drove roads. The actual driving of the
was entrusted to the clansmen, but it was the chiefs and
men, who received the cattle in rent, who organized the
and conducted the sales. Later, as banking houses were
ed, professional drovers began to come to Skye. They
y bought on commission, bartering their knowledge of the
ry for a profit. Some of these drovers replaced the tacks-
nd chiefs, paying them for the right to buy from the
men.

ts and Trade. In addition to the droving trade, there
limited amount of trade between Skye and the mainland in
products and a few necessities. As early as 1630 the
of oats and barley was sufficient to enable Skye to
t some grain to the mainland.[70] This export continued at
nd of the century.[71] Probably the area producing the
us was the barony of Trotternish. It was not, however,
s a favorable balance. In 1726, for example, MacLeod had

[71] Martin, op. cit., p. 197

288 developed from the concentration of power in the hands
175 of the merchants. In the early days of the industry,
441 all the processes involved in the production of a
286 finished length of tweed were carried out by individual
236 families. A man used wool from his own flock, and with the
438 aid of other family members, dyed it with vegetable dyes,
175 [386] carded and spun it by hand, wove it, washed and shrunk
286 it, and found his own buyer. Dyeing wool, spinning yarn,
236 and washing ("waulking") the finished length of tweed
175 was usually done by women. In Harris, the entire process
462 of producing a tweed was carried out by women, but in
Lewis the weaving was done largely by men.

175 A woman in her 80's recalls the process of weaving
286 when she was young. Hand-spinning had died out by this
time, although the question of whether tweeds woven with
such yarn could legitimately be called Harris Tweed was
not resolved until 1934.

175 "About 1916 or so it took about two weeks to a month
283 to do a tweed. You bought the wool from the Agricultural
[435] Board. Sixteen bags of wool, costing about L20, would
[433] do four tweeds. You needed four one-stone bags per
[386] tweed. Then you would spend a day gathering a bag of
[824] crotal (lichen scraped from rocks and used for dye). One
bag per one bag of wool was required for the dye. After

175 behind the tweed's popularity. The tweed was more than
286 a cloth; it was peat smoke and windswept moorland, the
288 [828] image of the free man who had escaped city life and machines and was the master of his own destiny. Steps had been taken all along the way to preserve the image of home-crafted goods, as when, in an effort to prevent machine-spinning, carding mills were built in Lewis and Harris at the turn of the century to prevent wool from being sent to mills on the mainland, where it was both [685] carded and spun. As early as 1906, a man was convicted in London of selling power-loomed tweed under the name
288 "Harris Tweed." Today power-driven looms can produce
402 double-width cloth 54 inches wide, a width much preferred to the 28-inch cloth produced on the Hattersley loom because there is less waste when the cloth is cut. But because "Harris Tweed" must be hand-woven, new looms of light-weight metal are being designed on which double- [435] width cloth can be hand-woven. The new looms will cost so much that many weavers say they would be unlikely to invest in them, especially given the uncertain future of the industry.

175 The Harris Tweed Association, formed in 1909, was
178 granted a certification mark by the Board of Trade which
288 was stamped on tweeds that were hand-spun and hand-woven
441 [424] in the islands. During World War I, hand-spinning died
[286]

175 178 288 286 441 out in Lewis, and the Harris Tweed Association was ineffective in enforcing its standards. In 1934, weavers were allowed to use yarn spun in island mills, and production increased; but no weaving was allowed to be done in the mills. All looms were removed from those mills which had tried to centralize this stage of production. The actual process of weaving remained, by legal definition, decentralized, although the word "crofter" was changed to "islander," thus widening the category of persons who could weave "Harris Tweed," and paving the way for centralization of weavers in the town of Stornoway.

286 288 467 Any person can purchase his own yarn, weave his own tweeds, and sell them to tailors or summer tourists; but before a weaver can weave for the mills, he must be registered with the Weavers Union. The Weavers Union is a branch of the Transport and General Workers Union, which includes mill employees, hospital workers, lorry drivers, and others. 288 467 It is an anomaly of the Harris Tweed industry that workers classed as self-employed should join a union of employees and is another indication of the centralization of control and power in the mills, with whom the weavers, along with the mill workers, bargain for higher wages. 288 433 466 304 Weavers receive a basic sum of over £10 for each length of tweed, which is usually 38 weaver's

175 178 288 the 1934 decision to change the word "crofter" to "islander") led to the weavers living in council [361] houses in town and working in loomsheds behind the houses. Unequal distribution has also contributed to Shawbost's relative prosperity, and to the decline of weaving in more remote parts of the island. The [464] unequal distribution of tweeds has made it difficult to maintain a large labor force, which in turn limits the growth and development of the industry.

288 433 178 [458] 3. Instability of the Industry: The Harris Tweed industry has undergone a number of crises. Periods of depression have alternated with periods of prosperity. (See Appendix B for the fluctuation in the number of yards stamped each year with the Harris Tweed trade-mark.) [435] [466] The very conditions which give the tweed its market value—the decentralized, non-mechanized human element—also limit the possibilities of growth in the industry, and contribute to the industry's instability.

288 441 When a business remains small, it must collect orders before it can provide work to have the orders filled (except when demand for an item is strong, as occurred around the time of the previous world war; during the war and for a few years after, tweeds could be made first and then marketed, because any cloth [471] could be sold). Only a large business can keep weavers

288 441 491 at work producing tweeds which it then tries to market. The latter method requires the investment of a great deal of capital to make the tweeds and pay the weavers before a buyer is found. The small mills require an immediate return for their capital investment, which is ensured [434] by not investing unless there is a definite order. The fortunes of the weavers oscillate with the luck and skill of the mills in soliciting orders; thus, the mills do not provide a constant, stable source of income. The 288 434 nature of the tweed, as a high-priced luxury item rather than a basic necessity, contributes to the instability of the demand. When fashions change or when world-wide economic depressions come, the high-priced tweed with its specialized image as a cloth for aristocratic, [185] sporty dress is forgotten for awhile. Efforts are being made to change this image; but the product's status as a high-priced luxury item persists.

288 441 458 An extremely small business can survive periods of depression when capital outlay in the form of machinery, running costs, and so on is not large. An extremely large business that has cornered a large share of the market can often survive an erratic schedule of orders because it has a larger accumulation of capital, but a medium-sized business has too much overhead to survive long periods of depression. Examples of all three exist

288 441 458 in Shawbost: a very small business, which until recently did not even have its own transport but hired facilities when they were needed and simply went into hibernation when orders stopped coming; a medium-sized business, which went into liquidation in 1971; and a large business, which continues to survive despite a depression which has continued since the late 1960's.

288 441 464 Harris Tweed is sent to markets all over the world; but because of the difficulty of maintaining a large labor force, the filling of orders is sometimes [439] slow. If large orders cannot be met, weaving as an island-wide occupation cannot be maintained. The number of weavers on the island fluctuates, as slack periods come and men adopt the time-tested strategy of temporary migration in search of other jobs. One [468] of the factors which aided the weavers during their [175] strike of 1943 was the fact that so many other jobs were available during the war that the future of the industry was jeopardized.

288 464 In the last five years the number of mill employees has decreased from 800 to 500. The decrease is due in [178] part to the introduction of more efficient techniques and new equipment, but there is little room for improvement in the production of tweeds because the human element, the weaver, is essential to its production.

ISLAND REGIMENTS

For a number of years it had been the practice for a considerable proportion of the older schoolboys during their attendance at the Secondary School to put in their training with the local body of Territorials—the Ross Mountain Battery. At the School Prize-giving of 1914, these boys attended in their uniform to be ready to go off the same evening by steamer en route for the annual training camp. Before the School re-opened, the Territorial Force was mobilised, and for some of these lads there intervened four long years of toil, of fighting, and of sickness overseas, before they ever saw their homes again.

Later (1938), the unit became the 203rd (Ross) Battery of the 51st (West Highland) Anti-tank Regiment. It was whilst fighting as an anti-tank battery that, with other units of the 51st Division, the men were taken prisoner at St Valery in 1940. Today, after more changes, the battery is the oldest in 540 LAA Regt RA, TA (the Lovat Scouts). In 1960 the Ross Battery received the Freedom of the Burgh of Stornoway in recognition of a century of voluntary service to the community and the nation.

LAND USE AND CROFTING

The history of land use and the crofting system in the Highlands and Islands (see Chapter 5) is full of difficulties. In the older days of the clan system, before the rot set in, though the clan members belonged to the chief, they also belonged to the land and the land to them. In such a climate, the agricultural system, for it was such then, was in a reasonably healthy state; the land was worked to the full. Good land was available for the support of the clan, and as often as not in good years there was ample produce, crops, and livestock, to send south to well-paying markets. That fertile lands abounded is indicated by the reports of visitors in various centuries. But times changed. The increase in population after the breakdown of the clan system by statutory legislation, and the policy of population placement carried out with a rigorous enthusiasm, planted seeds of discontent—in particular a hunger for land. The land was in any case becoming ever more inadequate to support those already on it.

The story of the agrarian troubles in the Highlands area is well

EIGHTEENTH-CENTURY ECONOMY

but their negligence even in ye article appears from their sending out annual above 2000 of wool out of the country unmanufacture.'

Harris was rented at £600. Exports were some 100 tons of kelp (£325), and the value of 250 black cattle exported alive, with 100 salted, was £445. Small quantities of cheese, wool, and the skins of sheep, otters and seals were exported. Grain was neither imported nor exported.

The plough, which is used here, and in most places of the long island, is of a very peculiar construction. Its length is but 4 feet 7 inches, and is drawn by four horses abreast. It has but one handle by which it is directed; the mold board is fastened with two leather thongs, and the soke and coulter are bound together at the point by a rim of iron. Beside kelp, there is little else manufactured, except a little coarse woolen yarn, and some blanketing, which they send yearly to Glasgow. They raise a little flax of which they make some coarse linen for their own use, but import all the fine linen which they consume. In the year 1756, an American vessel in distress was obliged to put out three hogsheads of lintseed in Harris, which was sown and afforded crops of lint which were above double the value of the usual crops. The east and west of Loch Tarbert in the Harris are every year revisited by the herring shoals. During the five years from 1743 to 1747, the west loch was the principal seat of the herring fishery. About thirty vessels from 18 to 40 tons, belonging to Campbelltown, Greenock, and Irvine, were completely loaded each of these years at this place.

With even a modest amount of business taking place, it was a natural step to establish commercial facilities. Stornoway men who once acted as agents became shopkeepers. The increase in the use of money attracted banks. During the Seaforth ownership of Lewis, the island had its own currency or notes, designed and printed from plates in the same style as the modern banknote. The wording ran: 'I promise to pay on demand to the Chamberlain of the Lewis or Bearer ONE POUND Sterling at the Counting Room here.' The notes carried a date and were signed by the proprietor, J. A. Stewart MacKenzie. It is not known for certain how long the notes remained in currency, when they ceased to be used, or even whether they were officially acceptable. At one time, as rare items, they fetched high prices from collectors. A number were

he small shop
ocks essential household items, and extensive use is made of mail-
der. A few years ago a telephone to the mainland was supplied,
uch valued in emergencies.

Scarp in fact has a small place of its own in the history of com-
unications: on 28 July 1934 one of three British rocket-mail
periments (for which special stamps were printed) was held
ere. The inventor of the rocket, Herr Zucker, was later to be-
me prominent in V-rocket work during the second German
ar. Herr Zucker personally conducted the firings. His rocket, a
rge cylinder with pointed nose, something like a heavy shell, was
ft long and weighed 30 lb, with capacity for several thousand
ters. The motive force was ordinary high explosive contained
a large cartridge about 18 in long; the device was designed to
rn with a series of rapid explosions and produce a flight speed
1,000 mph. The firing apparatus was a flimsy wooden structure
oviding a runway rising at an angle from the ground, an elastic
ng giving the rocket an initial impulse. The first rocket was fired
Scarp, to the mainland: it exploded prematurely and most
the mail was damaged. The postmaster applied to the backs
the damaged covers a three-line cachet in violet: 'Damaged
first explosion at Scarp—Harris.' In order that this mail should
actually flown, it was re-transmitted by the second firing made
the opposite direction, Harris—Scarp. The whole experiment
s deemed a failure, however. The route taken by the mail
dressed to Kirkwall was unique; rocket, ferryboat, motorcar,
il steamer, railway train, and finally by Highland Airways to
rkwall.

Depopulation in Scarp was encouraged by the lack of
ployment prospects, and centralised education, of the type
hich has already played havoc with remote rural communities
ewhere, is felt to be a black cloud darkening the future. Much
e same problem faces Scalpay Island, mentioned later. Children
e removed from their home environments for higher secondary
ucation at a central school: for Harris children this is at Por-
e, Skye. Many islanders argue that the scheme tends to destroy
e family unit, urbanising the children so that they become un-
ted to, and with no inclination for, rural life. Some sympathy
st be felt for the education authorities, of course, as the pro-

CHAPTER IX

ECONOMIC CHANGES: 1750–1919

(A) TRANSITION: MIGRATION, FISHING AND KELP-MAKING

UNTIL the 'Forty-five the township had lived an almost self-contained life. Its traditional economy was self-sufficient except for two indispensable commodities—salt for the housewife and iron for the smith. Beyond this, the chief demand for payment was the rent to the lord, with tithes for the kirk. For these needs and demands a step towards production for exchange was required, the more so that what was exported might include the very necessities of life in 'bad years'. The rent was paid largely by the sale of a surplus steer or two, and drovers called for the cattle. By 1790, if not before, two or three open boats set out annually from Uig, for instance, for Glasgow, laden with salt beef and dried salt fish. Although salt seems of little account today, it once bulked large in the Budget, its price being heightened by duty, especially after 1707: "as dear as salt", was a saying, *cho daor ris an t-salluinn*. Salt was needed to preserve the carcase of a 'cattle-beast' or sheep killed in autumn, and for cod and herring curing. Wrecks were valuable, as on all infertile undeveloped coastlands, both for their timber and their iron. Cairds or tinkers occasionally brought metal goods; or a packman called, as strange a figure then

as some Indian pedlar one meets on the road may seem now. An older packman's tale of his long tramps, of the people's poverty and hospitality, must have resembled the mingled plaints and praise one hears from an Indian pedlar today! But in the past only a speaker of Gaelic could find his way among the people. Almost until 1900, if not still later, Gaelic speech was to prove a social bond, but ignorance of English speech an economic barrier.

The transition to increased exchange, with migration, permanent and temporary, tended to make for specialisation. About 1795, *Statistical Accounts* enumerated, for every hundred families, two or three smiths, wrights (or carpenters), a shipwright or some boat-makers, a few weavers, tailors, and perhaps a miller. Each of these held some corn land, individually or in shares, with rights on the common. The line between plain crofters (to use a later term) and crofter-craftsmen was not easily drawn, and different writers wrote as they judged best. In Lochs, 80 per cent were fishers and net-makers. On the open shores of the west, in Barvas parish (in which three-fourths of the men were also 'fishers'), kelp-making was a seasonal occupation. In Stornoway parish, where sub-tenants paid 30s. to 60s. in rent, with twelve days' service, they sold ling to their tacksmen at 5d. each, earned £1 a month on herring boats, made kelp at 30s. per ton, and roads at 8d. a day.

In Harris in 1795 the eight 'bred' (or trained male) weavers worked only for 'the gentry': the laird, the tacksmen and their families. The rest of the weaving was done by the women, giving a ratio of only one male weaver to fifty-five families. But in Lewis male weavers were commoner—one to every twenty to thirty families was the ratio—as if the practice of home weaving by the women was less universal there, even at that date.

sary. In the end, an application was made in 1909 to that body for a trade mark defining Harris Tweed as 'tweed, hand-spun, hand-woven and dyed and finished by hand in the Outer Hebrides', with 'made in Harris' or 'made in Lewis' added as appropriate. The Harris merchants had to join forces with their former rivals in the tweed-marketing business, the voluntary non-profit-making Associations. To inspect the cloth and stamp it with a trade mark—an orb surmounted by a cross—a Harris Tweed Association was formed, consisting of representatives of each of the Harris merchants, the Crofters Agency and the Scottish Home Industries Association. Cloth was first stamped in 1911. In 1912, some Stornoway merchants were granted representation in the Harris Tweed Association, which still exists for the benefit of the industry.

In 1934, the definition of 'Harris Tweed' was eased to include any cloth 'made from pure virgin wool, produced in Scotland, spun, dyed and finished in the Outer Hebrides and hand-woven by the Islanders at their own homes in the islands of Lewis, Harris, Uist, Barra and their several purtenances and all known as the Outer Hebrides'. It was further provided that 'Woven in Harris', 'Woven in Lewis', etc, could be added, and also 'Handspun' in the case of tweeds made entirely from hand-spun yarns.

Today, a few Harris families maintain the old tradition, hand-dyeing and carding, spinning on the wheel, hand-weaving and finishing, producing a high-quality article mainly for individual customers. These tweeds rightly command up to three times the price for the general run of tweed.

OTHER INDUSTRIES

It was not until the era of Sir James Matheson that anything like a truly industrial activity was attempted. Matheson, a native of Shinness in the parish of Lairg, Sutherland, was born in 1796. Aged seventeen, he decided on a commercial career and took himself to London. After two years in a mercantile house, he went to Calcutta, where he worked in the counting-house of MacKintosh

& Co. The call of the Far East drew him away from India to Canton, where he set up business as an agent acting for firms in India. During the period 1815-20 he met William Jardine, from Dumfriesshire, who first glimpsed the mainland of China as a surgeon's mate from the deck of an East Indiaman three years before Trafalgar. Jardine left the East India Company in 1817 after sixteen years' service and, having with native prudence accumulated enough capital to set up on his own account, entered into an agreement with an East India merchant of London and a Bombay trader to operate the new ship *Sarah*. In 1832 Matheson and Jardine combined forces and interests to form Jardine, Matheson & Co, 'The Firm', as it has been known ever since those early days of commerce in the Far East. The unique experience which its founders and their successors have accumulated in providing services for manufacturers, and handling trade with more than a quarter of the world's population, is virtually unparalleled in the annals of British mercantile enterprise.

Matheson amassed a fortune. In 1842 he returned to his native Scotland, and finding that the Lewis estate was up for sale he bought it for £190,000 from the Estate Trustees. The island, at that time a truly isolated backwater, provided him with plenty of scope for ideas and work for deep pockets. He died on the last day of 1878. It has been estimated to the pound sterling that, including the purchase price of Lewis, Matheson spent over £574,363. More than £100,000 was spent in erecting Lews Castle and in laying out the grounds, which work provided his impoverished tenants with a means to earn something with which to buy their necessities. Briefly, Matheson drained land and reclaimed it; he planted trees; he built roads, bridges and quays; he excited anew an interest in the fishing industry and built premises for fish curing; he built a patent boat-slip for the contruction and repair of fishing and other craft; he established schools and paid the teachers' salaries; he also built a brick-works and a chemical works to distil paraffin from peat. He is remembered in Stornoway's Matheson Road: little else remains of his extensive efforts.

vision of adequate educational facilities in remote spots becomes increasingly difficult.

In its time Scarp has contributed more per head of population to the professions than has any other community of similar size. The last of the native Scarp population left the island in November 1971: two families totalling seven people. The island has now attracted the attentions of a hippie community.

Scalpay

Scalpay Island, on the east side of Harris, was formerly occupied by two or three tacksmen in succession before being 'crofted out'. About 1843 the Harris factor settled twenty crofting families who managed to make a fair living there, but five years later another twenty families were added; some had been evicted from the island of Pabbay in the Sound of Harris. This led to some subdivision of the available land. The 1861 population was 388, but the figure rose to a peak of 624 in 1921; in 1951 it had declined to 541. It is now in the region of 450.

Island Scalpay is in fact one of the few places in the Highlands and Islands area in which the normal trends associated with remote regions are operating in reverse. The island despite its smallness—it is a mere 3 miles long and 1½ miles across—supports a thriving and dynamic community and is the envy of its neighbours. Scalpay is retaining its young folk; and it boasts some of the finest homes in the Hebrides. From the agricultural point of view it is not greatly different from other islands in the Hebrides. Its forty crofts produce a good crop of oats; but less than 20 acres of the land are re-seeded.

The land being as poor as it is, the men of Scalpay have turned their faces to the sea—for a living, not for emigration. Scalpay has the largest number of full-time fishermen and a total of thirty-three boats, twelve of which are ringnetters of over 40 ft. Native enterprise is also shown in the ship-owning firm whose vessels carry freight and passengers to many parts of Scotland and on occasion to the Continent. A Harbour Association was formed on the island in 1966 to work for local amenities for fishermen and

the community generally—in particular for a landing stage in the North Harbour. The lighthouse at Eilean Glas, Scalpay, was in fact erected as long ago as 1788; for a long time it was the only lighthouse in the Western Isles. In 1792 it was described as 'one of great utility to the numerous shipping that frequent this channel [between Skye and the Long Island] on their voyages to and from the Baltic'.

The independence of the islanders again appears in their attitude to the education facilities provided for their children. In 1949 Scalpay parents staged a school strike in protest against the delay in the construction of a road to the school. At present the island has a junior secondary school but in 1966 the Inverness-shire County Council Education Committee proposed the transfer of the island pupils to the school at Tarbert; this would mean each child rising early in the morning to face a trip across Scalpay Sound and then a road journey to Tarbert. The inevitable protests against this proposal were rooted in its deeper implications. The school roll on Scalpay (70 pupils) has maintained a remarkable level of continuity over the years, reflecting the general prosperity of the island. Forced attendance at a central educational facility, the islanders maintain, will introduce an unsettling urban element into their children's adult views.

The smaller islands

To the west of Scalpay, in East Loch Tarbert, is the one-square-mile island of Scotosay. Its population was 14 in 1861, none in 1881, 18 in 1891, 15 in 1901, and 20 in 1911. In 1921 7 males and 12 females lived there, but none permanently since.

On the west of the Harris mainland is a high rocky island, four miles by one, called Taransay. In 1549 Dean Monro described it as being 'well inhabit and manurit', a place where people delved with spades, and with good barley and corn, and fishing. There are two old chapels and a burying ground on the island. The population of Taransay has declined to a handful through the years; its peak was 76 in 1911.

The Sound of Harris is 'a chaos of rocks and islands', so numerous that they cannot easily be counted. Some are mere pinpoints of rock; others once supported small populations. Nearest to the

The minister was cultivating potatoes and his family were eating them as an example to the crofters who were still reluctant to adopt the new crop. Some 70 boats were fishing; this was mainly in Loch Roag for they were small open boats greatly outnumbered in good herring seasons by boats from other parts of the kingdom. To encourage curing, particularly of white fish, the proprietor had set up two storehouse to supply salt; he, or his agents, were probably the only buyers - indeed John Knox, who visited Lewis about 1786, tells us that the estate factor held a monopoly for trading in cattle, dried fish and other products. The absolute power of the clan chieftain seems to have survived in Lewis until impending bankruptcy forced the sale of the estate in 1844. But it was kelp, more than fishing, that helped to support the people of Uig in the late eighteenth and early nineteenth centuries. Lewis made little kelp compared with the Uists, but the Loch Roag kelp was of particularly good quality and commanded more than the average price. Further, many people from Uig migrated seasonally to make kelp in Harris and Uist. Thus even at this time, the intrinsic resources of the parish appear to have been inadequate to support the population. In this connection it is worth noting the change in the average stock held by each family since 1792 as shown in table 3.

Clearance and Congestion

Even after the end of the tremendous boom in kelp, brought about throughout the Hebrides by the Napoleonic wars, some production continued in Uig. In 1825, when the land rent of the old parish was £1,862, the proceeds of kelp, after deducting expenses, yielded £1,010 to the proprietor. Thereafter it failed. Meanwhile Seaforth was attempting industrial developments and agricultural improvements. The former included short-lived distilleries in Stornoway, the latter involved the removal of some small tenants in order to introduce mainland farmers. For these Uig was particularly attractive, the extensive mountain pasture offering good prospects for sheep graziers. The exact dates of the formation of the earliest farms are not remembered nor are they precisely recorded, but at least as early as 1826 Alexander Macrae of Kistail had the tack of Scaliscro, with the extensive grazings (now partly occupied by Bernera summer pastures) east of Little Loch Roag. About 1823 the small tenants of Mealasta and Breanish were deprived of Mealasta Island, which suggests that a sheep farmer was already installed in that district. About 1838 all the small tenants were cleared out of Mealasta, six families being put into Breanish; the remainder are said to have been sent to America.

In Bernera island, Kirkibost was cleared about 1822, having been lotted in individual crofts some years earlier. Thereafter Kirkibost formed part of the large farm of Linshader. Little Bernera, too, formed part of this farm. On the mainland, opposite Bernera, small tenants were cleared from the shores of Loch Roag (e.g. Stroma and Drovornish) in the early nineteenth century, and a tacksman was installed at west Earshader. Further east the small tenantry were cleared from Ceanhulavaig and Linshader.

By 1844 the kelp shores were almost valueless to the proprietor (though seaweed as fertiliser remained a vital necessity to the small cultivators, often working the same land year after year). In 1861 the Chamberlain of the Lews suggested to the Select Committee on Emigration that some 6,000 persons should emigrate because the land was inadequate to support them. In 1844, of necessity, Seaforth sold the island. The population of Lewis was then 17,000 (Uig 3,316); little did the Chamberlain imagine that in the following ten years it would increase by 16%, and that by the turn of the century would reach almost 30,000, (Uig 4,462 Figure 4).[1]

463 326 [874] [604] [521] One of his apprentices was his sister's son, who built another smithy not far away. "This was the center of gossip. People gathered there while he shoed horses that came from Barvas to Carloway."

444 178 [494] A number of shops were established in Shawbost that sold clothing, cooking ware and groceries. At one time they numbered six altogether. These shops also ran the first buses between the village and Stornoway. Gradually these businesses disappeared because of competition with larger companies. Mobile grocery vans and butcher shops and bakers began coming in the late 50's, and gradually took over the trade in large parts of the island, undercutting the local businesses. Income from weaving had already weakened self-sufficiency derived from the intensive use of land and sea and also weakened the formerly heavy reliance on local ties and mutual aid. Today an army of town-dwelling entrepreneurs and employees constitute a major proportion of the traffic on the island roads. Grocers, fish dealers, bakers, sellers of soft drinks, garbage collectors, insurance salesmen, mobile banks, coal dealers and others extend goods and services from centralized sources to a market which has money to pay for them. The island's participation in this extensive market system is affected by its marginality to the

[497] [443] 178 434 57 621 44 463 178 [472] [484]

597 621 child may come to spend nights or longer periods of time with them.

476 621 [576] To some extent villagers are still dependent on each other for various kinds of help. It is considered extremely bad manners to refuse labor, a tool, or food to anyone who requests them. If someone refuses to aid another, people say, "What will he do when he needs help?" This attitude has made the island a paradise for the few salesmen who, in the last few prosperous years, have started to visit its communities; villagers find it difficult to say no to anyone who comes to their door with a request, including the request that they buy something.

[443]

621 574 844 A woman in childbirth was formerly attended by a local midwife, and kept in bed for two or three weeks. "Other women, both relatives and friends, came and stayed with them at night, fixing them warm tea and milk, whispering bhronag bochd (poor soul), how awful you look..." Just as today the neighbors gather at times of illness and death. It is more difficult for neighbors to come to the bedsides of young mothers of today, who are all taken to the hospital in Stornoway to have their babies; but the neighbors manage to visit the hospital, which has no choice but to ignore its rule of only two visitors per bed at a time.

[178] [743]

175 26 [132] [443] During a huge snow-fall that occurred on Lewis in the 1950's, the mobile grocery vans and other supply vehicles could not come out to the west side, and a group of men had to make an expedition into town for provisions, after which many families made certain that they always had a good supply of meal, salted mackerel and herring. Many villagers have gotten deep freezers to store beef and mutton; others say they do not trust the freezers, that a failure in electricity—which occasionally happens in this region of gales and far-away repairmen—would bring disaster if they depended fully on them for keeping their meat. When the tweed industry is going through one of its periodic depressions, more men go out more often to fish. "I've been going out every night for the last week or so. I don't have a tweed, and I won't have one for the next six weeks. I don't know what I'm going to do; maybe I'll go back to sea. Three of us caught one hundred mackerel last night. I salted my share, and didn't give any of them away. These are the hard times. We're going to need them during the next six weeks."

[404] [365] 458 226 [251]

233 [654] A few people raise beef cattle, depending largely on subsidies for encouragement to do so. A few are beginning to keep cows again for milk, giving as their reasons that freight charges make the bottled milk too

[234] [426] [434] [648]

288 Thus were laid the lines of a new form of economic organisa-
175 tion for Lewis. At first, tweed manufacture here, as in Harris, was
[462] strictly a domestic activity: the wool of the crofter's own sheep was clipped, washed and dyed, carded, spun at home, and woven into cloth by persons in the township with the skill to produce a suitable cloth; the weaving was a part-time and mainly female occupation. Payment for the weaving was in kind: peats, potatoes, or labour. The waulking or finishing of the cloth was mostly a communal activity carried out by the womenfolk, who turned it into a particular social occasion with definite feminine characteristics. If the cloth made was in excess of domestic requirements, the crofter sold it directly to a customer, or else the local shopkeeper bought it or gave credit for it.

288 With the rise in weaving for a definite market in Lewis, all this
463 changed. Weaving became a full-time specialist occupation and,
175 partly because the flying shuttle made the work heavier, it be-
[462] came predominantly male work. With the use of mill-spun yarn there grew up a number of merchants, the Lewis 'producers', who
288 bought yarn either locally or from the mainland, and put it out
175 for weaving and hand finishing on a commission basis. The yarn
[441] and the resulting cloth remained their property. At times the cloth embodied a handspun weft; at other times perhaps no handspun was used at all. As pointed out above, it was marketed as Harris Tweed, as was the 100 per cent handspun cloth, yet it cost about 21d to produce compared with 36d for the 'real' tweed. The cheaper type provided Lewis's rapidly-expanding output between 1900 and 1911, and by that year Lewis had outstripped Harris. In 1912, the handspun yardage produced in
[433] Harris was 175,000; partially and wholly millspun accounted for some 4,000 yards; and the total value was £26,500. In Lewis the yardage of handspun cloth was some 10,000; but about 340,000 yards of partially or wholly millspun was sold. The total Lewis
[435] value was £44,000.

The trade mark

288 When eventually the question arose of some mark to distinguish
441 between the two cloths, it was with difficulty that the Harris mer-
175 chants persuaded the Board of Trade that a distinction was neces-
424

[432] stripe running across the slope, which are interchanged each year, whilst a large part of
[437] the common grazing lands are divided into interchangeable sections ("quarters") to
[439] accommodate each of the groups of crofts. See Figures 22 and 23.

The cultivable crofland at Kneep is relatively flat and the natural drainage is poorly developed; the quality of this land, depends to a very great extent on the upkeep of a dyke running across the crofland from a small marshy loch to the sea. This dyke has not been cleaned for several years, and as a result a large area has been invaded by reeds. Other parts of the crofland have been similarly overrun by 'wild rhubarb'. Sock deterioration is almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the edge of the machair have probably never been occupied since the crofts were allotted in 1921 and are now used only for grazing. The main body of the crofts (nos. 3 - 12) lie to south - they are more compact than those in Valtos and Reef, but they vary in size from 2.9 to 12.29 acres and their boundaries are irregular in shape. Two crofts (14 and 15) are separated from the main parts of Reef: they are both small (2.5 acres) but the size is compensated by their situation on the level terrain of the machair. The old farm house is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the machair croft, is on lazy beds - but many of these have decayed with the advent of horse and tractor ploughing; 35% of the land is cultivated by spade, and the remainder by horse plough.

[433] The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen
[439] crofts are occupied and of these five are worked by disabled crofters or crofters over
[439] sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today
[439] seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

[233] Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan Islands, fifteen miles west of Uig.

[442] Fig. 24 shows the age/sex structure of the population in the three townships. It tells a story familiar to crofting townships: 59% of the resident population are over forty-five years of age; 9% of the total population are permanently away; and since 1939 the population has declined by at least 19% as the result of emigration alone. But perhaps the
[442] most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

[438] By their very position, the townships of the Valtos peninsulare isolated. Fifty years
[438] ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep was built originally to bring the mails from the pier at Mealrig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at
[433] Valtos and Kneep, and at Mealrig which serves Reef, Uigean and Cliff. These are supplemented by travelling shops -hich call once per week, by Indian dealers and by the
[434] local 'bus-driver who makes purchases in Stornoway on behalf of customers on the peninsula. The school for the whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

distinction. During the war when Skye had its own little [875]
army, he came to know many of the old crofters quite well. [584]
Finally, he came to use personal names when speaking to them [576]
and asked to be called by his first name. The people explained that they might be older than he, but he was too important to be spoken to as anything other than mister.

The tradesmen and the shopkeepers in Glendale and [554]
Kilmuir are not any different from any other man. They are [443]
not specialists. They are part-time crofters. We have to turn to Portree to see what status position they fill in the society of Skye. I might just add that they are on a first name basis with their neighbors, and, like the crofters, they are known beyond the neighborhood by their first name and township, such as Ian Bayve or Murdo Stein.

To summarize, there is additional evidence for cultural [596]
continuity in the structure of the neighborhood. The ex- [182]
tended family, although very unstable and, therefore, somewhat amorphous, is still a reality in the minds of the people. It still has two functions which it must have had in the remote past: seeing that all are cared for and given a decent burial. The ascription of status noted for the township [554]
carries over to the neighborhood, as does the underlying status [182]
equality and need for unanimous consent. Among the crofters leadership is still undeveloped. The old men can enforce conformity but they cannot lead. Although prestige ranking is developed, in the form of the achieved statuses of ministers, doctors, and teachers, it is significant that, except for the minister in Glendale, all holders of prestige status are

The crofters of northern Skye are dependent upon the [272]
village for the goods of the shopkeepers and the services of [346]
the tradesmen. Several times a week food vans from Portree, [443]
or from a national concern with headquarters in Portree, call at the crofts. Twice a week a shopping bus brings the men and women into the village from Glendale, and there is a daily bus service from Kilmuir. For the nearby neighborhoods, the [368]
village is of religious importance. If the crofters do not come into the village to go to church, the local ministers go out to serve them. They also send their children to school in Portree. Few of the crofters take an active part in the formal social life of the village, but for all who come in on business there is an opportunity for men to stop by at a pub to have a chat with friends and women to get together in a tea room for a bit of gossip. Then too, for many it is an occasion to visit kinsmen who have left the croft. Nevertheless, despite its functional importance, the village [367]
has remained something alien and apart for the crofter. [824]
Despite the bonds of friendship and kinship and mutual economic dependence, there is antagonism between the rural dweller and village resident.

Part of the crofter's hostility stems from the religious [367]
ethos. On at least one occasion, Portree has been described [824]
by a minister as being almost as wicked as Sodom and Gomorrah.[25] [771]
In the eyes of the majority of the clergy, the village contains the "synagogues of Satin" from which flow the poisons of

Business structures	347		

[195] went away to the fishing, their families bought groceries
[445] on credit. "If the merchant thought the fishing season
[452] would be good, he let them have as much as they wanted; otherwise he restricted them in their buying."

The barter system continued in Shawbost long after
[288] it stopped in Stornoway. A weaver was given credit in
[175] Coinneach Rod's store, until it closed in 1948, for the
[157] exact amount of the tweed. He never gave money. "You had
[444] to get just the right amount of goods, even down to
[437] tuppence in matches." People were forced to buy huge
[472] jars of jam which they did not really want or need. Some "cunning" fellows would slip a two-pound pair of shoes into a shoebox marked 15 shillings. "Coinneach Rod would ask if you wanted a wireless, or would a tweed jacket fit your son. You couldn't refuse, or you wouldn't do any weaving for him for a long time."

Coinneach Rod bought looms for many weavers, and they
[288] would weave only for him to pay off the debt. "People
[175] living on the dole with a large family would go to him
[154] and ask him to buy them a loom. He would get the man a
[472] loom, and then get him a lot of tweeds to weave so the man
[452] could pay him off. It was two tweeds for yourself and one for the loom."

2. Centralization and Specialization: Centralization
[288] and specialization in handling the production of the tweed
[175]
[441]

[463] One of his
[326] apprentices was his sister's son, who built another
[304] smithy not far away. "This was the center of gossip.
[304] People gathered there while he shoed horses that came
[521] from Barvas to Carloway."

[444] A number of shops were established in Shawbost
[108] that sold clothing, cooking ware and groceries. At one time they numbered six altogether. These shops also ran the first buses between the village and Stornoway. Gradually these businesses disappeared because of competition with larger companies. Mobile
[444] [443] grocery vans and butcher shops and bakers began coming in the late 50's, and gradually took over the trade in large parts of the island, undercutting the local businesses. Income from weaving had already weakened self-
[108] sufficiency derived from the intensive use of land and
[157] sea and also weakened the formerly heavy reliance on
[521] local ties and mutual aid. Today an army of town-
[444] dwelling entrepreneurs and employees constitute a major
[463] proportion of the traffic on the island roads. Grocers,
[178] fish dealers, bakers, sellers of soft drinks, garbage
[472] collectors, insurance salesmen, mobile banks, coal
[481] dealers and others extend goods and services from centralized sources to a market which has money to pay for them. The island's participation in this extensive market system is affected by its marginality to the

[585] For some weeks after returning, the couple goes visiting
[178] with a bottle. The scope of visits seems to have narrow
to close relatives unable to attend the wedding, and sometimes the custom is referred to as old-fashioned.
[431] The bride usually makes pieces of bridal cake to
[265] relatives who were unable to attend the wedding.

2. Death: At a time of illness or injury, an
[758] individual may see persons he has not seen for years.
[574] The house is filled with a constant flow of visitors, and the visitors recount every detail of a sick person's
[763] pallor and movement. The room is usually occupied by visitors when a person breathes his last.

In the past, work ceased in every house in the
[763] surrounding neighborhood when a person died. This no
[441] longer occurs. (The story is told of a weaver who called
[178] a mill in Stornoway to say that he could not finish an
[288] urgent tweed because there had been a death in the village, and was told, "You keep on weaving till the
[535] weaver dies.") However, dances in the village are
[444] cancelled, and the bothan (an isolated hut in which liquor is sold illegally) may close. Outdoor work, such as peat-cutting, which would be widely seen is avoided.

[763] Word of the death spreads throughout the village and
[203] beyond within a few hours. From an immense, accumulated inventory, memories of the deceased are brought out,

*159 288 with his brother-in-law, but they had only one loom.

At that time the mill was buying yarn from other mills in town, warping it on the mill premises, and sending it to the weavers together with the yarn for the weft.

Ruaridh heard through the grapevine that more warpers were wanted at the time, and went to ask "the old man, Coinneach Rod, himself," about the possibility of his [445] getting the job. He worked with five other warpers, who averaged five warps a day, at four shillings each. They were paid by piece work rather than on an hourly basis, and received payment once monthly.

Business was going very well. The mill was receiving large orders from America. A few more warpers were hired. [458] A slump came in 1946, and Ruaridh Dan and several others were laid off. Ruaridh went to work for a building contractor, but was called back to the mill after a month's time.

*159 After warping for several years, he started work in • 444 the yarn store, which dispensed yarn to the weavers.

"I was checking the yarn that was going out to the weavers, weighing the wefts, checking the colors that were used, keeping a record so we could tell at a glance what stock we had, how much we would require for any further orders we would get. Well, the job got to a stage where I just couldn't manage it, and I protested. Another man started to work with me. I was paid a regular wage so it was a

finished cloth. About 1,000 workers are employed at the mills, 288 representing about 95 per cent of the island's industry—not count- 464 ing, of course, the 1,200 or so self-employed weavers. The Shawbost mill, started in 1915 in a very small way, employs about seventy people from the surrounding crofting community on dyeing the wool, carding it and spinning it into yarn, and has about 500 weavers on its looms. In 1955 it became a limited company [403] and a £35,000 finishing plant was added; other recent extensions have been made to the tune of £70,000. The establishment of such a large industrial complex in one of the remotest parts of Britain is an achievement to be underlined.

The early cloth industry

Coarse woollen cloth has been made in the Hebrides, as in 288 other rural Highland areas, from time immemorial. Rents were 175* often paid in blankets or plaiding. In 1656, 'pladding' was one of [429] the items of trade brought by Highland boats to Glasgow for sale there. In the late eighteenth century, blackfaced sheep were intro- [236] duced into the Highlands and islands; the fleece from this breed was much heavier than that of the native sheep and consequently proved ideal raw material for local woollen manufacture for trade. In the Hebrides, the product was mainly for domestic and [438] local consumption. The people of Harris, however, were well [439] known for the excellence of their weaving which found a limited external market. In 1844, the Earl of Dunmore, the first non-native proprietor of Harris, had the Murray tartan copied in tweed by local weavers, so successfully that the Earl and his enterprising wife encouraged improvements in the product and introduced it to their friends. The cloth, ideal for outdoor pursuits such as fishing and stalking, found ready wearers. In 1857, [447] • an Edinburgh lady went about getting orders for the Harris weavers, and business increased so much that in 1888 she moved to London and opened a small depot for tweeds.

Thus by the time the nineteenth century had reached maturity tweed was becoming well known, and weavers and local merchants, usually shopkeepers, developed sales contacts on the mainland. At that time every web of tweed produced was unique: it could never be copied exactly. This of course added to its charm

451

451 ACCOUNTING—bookkeeping methods (e.g., double entry); principles and techniques of business accounting; preparation of financial statements (e.g., debits and credits, income and expenditures, profit and loss); methods of dealing with intangible factors (e.g., good will, depreciation); specialists (e.g., accountants, financial counselors); financial records; etc. See also: Bonds . . . . . B; Endowments 803
Government accounts 682

175 might be thought) in cured fish. Here is a sample Deposi-
241 tion from Borve (W. Lewis), a township then composed of
427 five hamlet-farms, or 'pennylands', with their share of
430 outrun, peats and fishing grounds over the whole and known as Five-Penny Borve.

Donald McGillimichaell, William McHomas, Gillichallum McCoilog, and John McConnell in five penny land of Borrow and Parish of Cladach aforé MAKE OATH severally that neither of them has any Tack of their possessions, But that each of them pay yearly to ye above Mr. Zachary McAulay for behoof of ye Countes (of Seaforth) foré Nyne Pounds Scots (*i.e.* 15/- sterling), Two Bolls one Lipie meall, Fifteen pound weight of Butter, and three-fourths of a mutton. Depone they and each of them are someqt in arrear but know not the Particullars, and this is ye truth as they and each of them shall answer to God, and depone they can't write.

(Signed) DAVID BETHUNE
(Sheriff Substitute of Ross).

175 The only point on which these good fellows must have
241 had to face qualms in 'answering to God' was their lapse
427 of memory as to 'Particullars of arrears'! None of the
• 451 222 small tenants could remember this! Although the
[612] Chamberlain or Factor, Zachary MacAulay, denied it, he
[613] may have exhorted or compelled payment of rent in order to forward it to the exiled 'Marquis'. Mainland rents were actually despatched to France from Leith in broad daylight under an armed guard of clansmen! At the same time, neither MacAulay nor the joint tenants were of Clan Kenneth, the MacKenzies. MacAulay himself was a man of high character—and a poet too—and not one to collect rents in order to embezzle them. His affirmation has the ring of truth, with little alloy. To the Government Commissioners he wrote that what made it impossible for Lewis peasant-fishers to have paid rent in full during civil war,

175 and still more to pay arrears, was "the rugged Hag,
241 Poverty, that would resist both King and Government".
427 We may guess that MacAulay passed a hint to the tenantry
• 451 that (in a good Gaelic idiom) they had better 'disremember' details of arrears: and this they did.

175 Of the four names on the deposition quoted, one or
551 two may have been surnames, others the patronymics of
613 kinsmen. As is still the custom, clansmen knew one another
[198] by names of many kinds. Stature or colour was used to distinguish a big John from a little one, a fair from a dark, or a pale from a swarthy; occupations such as smith or
[241] carid (artificer, not necessarily travelling tinker as now) were
[226] used, and also mere nicknames. Of the eighty-one crofters or fisher-burghers in Stornoway, fourteen were Mac-Kenzies; and other mainland surnames, such as Fraser and Gunn, Matheson and MacLennan, also showed their descent from the immigrants brought in when MacKenzie of Kintail founded the burgh to encourage fisheries after 1611. Each held a single holding, usually rented at two shillings sterling.

175 To conclude, rentals about 1715 show (1) the character-
241 istic equalitarian grouping of small peasants as fellow-
427 workers in the hamlet-farms still held directly from the
631 superior, Seaforth; (2) the eighty-one small burghers of Stornoway; and (3) tacksmen, responsible for the larger part of the Island rent, but under whom we know that the labouring peasantry, though without the local independence of the others, also continued to dwell and to work together. The tacksmen were to pass away, as many of them had originally come, at the desire of a mainland lord, and the lord, in his turn, was to leave; but the small peasantry of immemorial stock still hold and work their land.

175 a crew member. Another family is called "cook," the
209 first job which a novice had to assume when he joined
[464] the crew of a fishing boat. One of the last men to go
[556] to the east-coast fishing is about 60 now. The men came back from the fishing in time to bring in the oats,
[224] barley and potatoes, and the money was used for rent
[434] and the purchase of various foodstuffs and other goods. They usually brought enough rolls of wallpaper to cover
[353] the stone-walled or wood-lined bigh dubh (black house)
[434] for another year. Twenty pounds were good wages for a season. While the men were away at the fishing, the
• [452] remaining members of the family lived on credit from
[571] the local shops, and depended on the good will of their neighbors.

Many men joined the armed services, and were
175 especially sought after by the Navy and the Merchant
[76] Service. In 1900, there were 2,500 Lewismen in the
[506] Naval Reserve.

Around the turn of the century, until the first
175 world war and the growth of the weaving industry, the
228 girls used to "follow the fishing." "Everyone came to
[184] the boat to see you off. You could go all the way to
[571] Aberdeen for 12/6 on a special fish-worker ticket."
[435]

The girls went from the south of England to Shetland in the far north.

8 businessmen nervous breakdowns because of the risks he
5 continued to take. "He was planning to start some
9 business. At one point it was going to be either
2 distilling or the tweed, and he just happened to go for the tweed."

Some say Coinneach Rod had physical disabilities, developed or aggravated by military service, which made him unable to work like other men, and hence he was forced to find other ways of earning a living. He was a merchant, like other islands who became entrepreneurs in the tweed business.

According to one version of Coinneach Rod's life, he began to handle tweed on a large scale as the result of an accident, when an agent selling tweed for a merchant on the east side of the island arrived on Lewis for the first time, asked for a "Kenneth Macleod, merchant," and was directed to Coinneach Rod of Shawbost.

"He was also an earthy, natural, easy man to get on with. He never changed, even after the money came. He would sit the buyers down with a plateful of cuddies and say 'Dig in,' 'Eat up.' He always ate them whole, and never spat out the bones. The buyers liked that. They liked his easy manner."

5 Between the first and second world wars, the merchant
1 was an extremely powerful figure. When men and women
2

175 went away to the fishing, their families bought groceries
441 on credit. "If the merchant thought the fishing season
452 would be good, he let them have as much as they wanted; otherwise he restricted them in their buying."

288 The barter system continued in Shawbost long after
175 it stopped in Stornoway. A weaver was given credit in
159 Coinneach Rod's store, until it closed in 1948, for the
444 exact amount of the tweed. He never gave money. "You had
437 to get just the right amount of goods, even down to
472 tuppence in matches." People were forced to buy huge jars of jam which they did not really want or need. Some "cunning" fellows would slip a two-pound pair of shoes into a shoebox marked 15 shillings. "Coinneach Rod would ask if you wanted a wireless, or would a tweed jacket fit your son. You couldn't refuse, or you wouldn't do any weaving for him for a long time."

288 Coinneach Rod bought looms for many weavers, and they
175 would weave only for him to pay off the debt. "People
159 living on the dole with a large family would go to him
472 and ask him to buy them a loom. He would get the man a
452 loom, and then get him a lot of tweeds to weave so the man could pay him off. It was two tweeds for yourself and one for the loom."

288 <u>2. Centralization and Specialization</u>: Centralization
175 and specialization in handling the production of the tweed
441

241 grazing land and he could not transfer such prope
175 a will. Similarly a crofter had no right to his
423 and could not formally protest if another crofter to apportion this land for his own use (see Chapt
[829] for a discussion of apportionments). But in both situations, informal understandings superseded le rights.

241 Various legislative acts which followed the
657 act focussed attention on the crofter. Various m
175 associated with crofting are handled by a Crofter
[654] Commission. Crofters have access to grants and l
[494] to improve land and build fences and homes. They buy goods at low prices in a nearby cooperative s As crofts were fenced, land around the townships scarce and non-crofters found it difficult to kee large numbers of cattle and sheep.

241 Within recent years it has become possible f
178 crofters to gain title to the small plots of land
423 which their houses are built. Some loans are ava
[452] to them for building houses. Non-crofters have a
[654] to the various subsidies available to all agricul such as the subsidies for raising hill sheep and
[829] cattle. There is still the feeling, however, tha crofters have rights which non-crofters do not ha and that in conflicts over scarce goods crofters

of Lord Seaforth's conduct in this matter. They alleged that he 228
'draiv in hither an number of strangers who daylie resorts to and 175*
fra Holland to the Lewes and continent next adjacent (the Ross 648
mainland presumably) and has caused them be answered of all such commodities as these bounds affords, as nameli with fishes and beeves quhilkis with the hyde and tallow, with manie utheris commodities they transport to Holland.'

To satisfy the Royal Burghs, Seaforth had some of his Dutch friends sent away. But several Dutch families remained in Stornoway until the outbreak of hostilities between England and Holland in 1653.

In Harris, similar efforts were promoted by Captain Alexander 228
MacLeod, who in 1779 bought Harris, together with St Kilda, 175*
for £15,000 from the commissioners acting on behalf of General [425]
Norman MacLeod. The latter had, in 1772, inherited from his grandfather both the chiefship of Harris and a debt on the property amounting to some £50,000. Captain MacLeod, who skippered the East Indiaman *Mansfield*, did much to stimulate better conditions in Harris, and advocated the generation of a fishing industry. In the face of opposition and ridicule he showed by practical example what could be done to make a success of the herring fishings, introducing a number of east-coast fishermen with Orkney trawls to teach the inhabitants, and reaping a good harvest from the fishings off Rodel, despite the dismal auguries uttered by the Harris-folk. He improved the local harbour [503]
accommodation and erected a storehouse for salt, casks and the [488]
like, he built a factory for spinning woollen and cotton thread, [288]
and twine for herring-nets; he advanced money to those fishermen [452]
who were interested for the purchase of boats and gear; and he [427]
provided them with rent-free cottages with a ground-patch on which they could grow potatoes. He built roads between the [491]
village of Tarbert and the two jetties he made there, and he [346]
erected a schoolhouse and an inn. But all this hard work to put [485]
Harris on some realistic economic basis came to little. The native population were slow to appreciate the potential income lying about them.

The potential of the sea was of course eventually realised, particularly where the fishing grounds were favourable, Stornoway

herring boats belonging to Lewis was about 165, reaching a peak 228
of 197 in 1889; the number of boats used for cod and ling fish- 501
ing reached a peak of 704 in 1895. The figures, however, fluctu- 175*
ate considerably from year to year. The main reason for this was 501
probably that these boats were not personally owned, but largely 228
belonged to fish-curers and businessmen, to whom the boat crews 175*
were in debt, having received capital advances from them and 452
from the State for boats and gear. Crews who had bad luck at the fishing had their boats impounded and sold to recover the amount of the loan. Many boats were also wrecked, for navigation in bad [502]
weather is still difficult even in these days of advanced directional aids.

The state loans to fishermen are worthy of note here, because 228
they foreshadowed a similar scheme in the 1960s. They were 175
made under the Crofters Holding Act 1886. Section 32 of the 452
Act authorised the Fishery Board for Scotland to make advances, by way of loan, to persons engaged in the prosecution of the fishing industry, whether crofters or others in crofting parishes. For new boats, the maximum sum advanced was £312. The loans carried an interest of 3½ per cent; repayments of principal and interest were over a period of from four to ten years. Loans for the improvement of existing boats were also advanced, varying according to the condition of the boat or other circumstances affecting the necessary security requirements. New boats were mortgaged to the Fishery Board.

Ninety-three Lewis fishermen received loans totalling some £12,000, and a sum of £18,000 was distributed in loans throughout all the crofting counties. In a report issued in 1901, it was indicated that these ninety-three Lewis fishermen had repaid about 82 per cent of their principal and interests, but in other counties the repayment percentage was under 60 per cent. The Lewis figure would have been higher were it not for the loans made to the Barvas fishers, on which the repayment figure was only 24 per cent. When borrowers failed to observe their part of the contract the Fishery Board seized the boats. Many of these loans were originally made to aid a deserving class of men in adverse circumstances and surroundings. To achieve the high overall percentage of repayment (some indeed managed to pay

The 1,700 acres of common pasture stretch to the east and west of the crofts, across the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird lacks the advantages of the machair land found further west. To the north of the village there is now an R.A.F. radar station on Rudha Caol, built on what was part of the common pasture. It dominates the landscape and makes a considerable difference to the life of the inhabitants.

The township, though isolated, is reached by a good road which leaves the main road at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a butcher's van on Saturday, and the local people are also allowed to shop at the N.A.A.F.I. within the Camp. The road through the village approximately follows the line of the 100 ft. contour and all the houses are built directly on to the road, with byres, weaving sheds and other buildings behind, whilst in most cases hens are kept on the steeper slopes below the road. Thus the settlement has far more of the appearance of an English village than have most crofting townships, but there is no shop or post office. The majority of the houses are stone with slate roofs and fairly large, though some of them have been built for more than fifty years. All have electric light and their own water supply and several have modern byres.

There are ten crofts, as the enlargement of one of the original nine was subsequently split off to make a separate croft. Of these, one tenant is an absentee and another an elderly woman who does no cultivation. In both these cases, grazing is let to others so that there are actually eight operative units. The crofts are fenced in their upper portions, but in most cases the fencing does not extend down to the river and there is free access to the single concrete footbridge which spans the stream.

The only crops now grown are oats and potatoes and a few vegetables, with some sown grass; natural grass provides most of the hay crop. Lime and shell sand and artificial fertilisers are used; the two former particularly on the ground near the river where the cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse. Most of the cultivated land is on the gentler slopes behind the houses, where the use of a tractor is possible. Before 1914 most of the land within the original turf dyke was cultivated; bere was grown and ground at the mill for meal for barley bread. Seaweed was extensively used as a fertiliser and most of the families kept eight or nine cows, so that there was a more plentiful supply of manure. Now, six of the families each keep one cow for domestic milk supply (two of the others each keep a goat). The township possesses no bull, but make use of those at Valtos or Ardroil.

On the other hand, the sheep soum is generally exceeded; instead of the entitlement of about 200, the total flocks grazed on the township pastures are approximately 500. The lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented this) and wedders are usually sold at the age of two or three years in Stornoway - many in October to reduce the numbers that must be pastured during the winter.

The total resident population of Aird consists of fifteen males and sixteen females. Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there are only three married couples) and there are two children under 15. Nevertheless, most of them are complete families; only one person lives alone; no members are reported as periodically working away, no men and only two women are permanently away. Neither has there been much emigration since 1939 - five women only have married out of the parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 - 44 age-group is a new-comer to the district and does little croft work.

An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on the individual croft to the size of holding and to the availability and age of the labour force. In both diagrams there is a significant division between the subsistence holding (0 - 7 units) and the commercial holding (11+ units), but there is no definite relationship between stock and size of holding or labour availability. The inclusion of the points of equilibrium for certain lines in Figure 20 reveals a somewhat unexpected state of affairs: in the case of crofters with regular work and full time crofters, those over the age of forty-five carry a larger stock from those under forty-five. It is frequently argued that the solution to the economic problem of crofting lies in the amalgamation of holdings in order to create a more viable economic unit, but the indication from these diagrams is that an increase in the size of holding will not, of itself, lead to an increase in stock. It is the absence of accessible markets that deter the crofter from increasing his agricultural production.

In their present state the crofts in the Valtos area are unable to provide a livelihood for the crofter and his family. Of the crofters under sixty-five almost 90% supplement the croft income by other employment. Of these casual labour (at present mainly at the Gisla hydro-electric scheme) accounts for 57% regular work - particularly weaving - 43%. The combination of crofting and weaving provides probably the best return for the labour: one crofter with a croft of 3.3 acres, carrying two cows, two followers and ninety sheep (sixty ewes) made the following estimates for 1958:

FROM THE CROFT:	
Sale of two year-old calves	£80
Cow and calf subsidies	£40
Sale of wool at 4s. 3d. per lb.	£75
	£ 195[1]
FROM WEAVING -	
at two tweeds per week (32 hrs. p.w.)	£550
GROSS INCOME	£745

Weaving abour 30 hours a week apparently leaves him sufficient time to run the croft efficiently; at present a crofter supplementing his income by a labourer's wage at Gisla hydro electric scheme would have to put in nearly sixty hours per week to achieve the same financial reward.

The economy of the Valtos peninsula has been changing, and contracting, for several years. The number of unoccupied crofts is increasing; commercial fishing ended at the time of the first World War; the shielings have been abandoned as summer cattle pastures. The Valtos shielings near Loch Scanadale were abandoned during the 1939 - 45 war, due mainly to the lack of manpower in the township, though some was used intermittently until 1953. The shielings of Kneep and Reef were abandoned in the late 1930's, at which time Kneep had some fifty milk cows as compared with fourteen in 1959.

[1] Against this figure, must be set the costs of production (i.e. fertilisers, new seed, winter fodder supplements, sheep dips etc.)

228 off all their debts) much hard work was called for, as well as skill
52 in locating herring shoals. The seasonal migration of herring is
75 still a puzzle to marine biologists; it contributed to many a Lewis fisherman drawing a blank, to his ruin, while his neighbour came home flushed with success.

228 The financial values of the fishings of the island, particularly
75 Lewis, are some index to its fluctuating prosperity. In a *Guide*
435 *for Scotland*, intending visitors to Stornoway were told that the annual figures for herring exports were, in 1860, some £60,000; for cod and ling, £13,600; smoked haddocks were valued at £1,600; lobsters at £1,396. Herrings caught in Harris and Lewis in 1889 were valued at £57,071. Two years later, the figure was £90,738, but after that year it steadily declined to reach a little over £20,000 in 1894. Increasing again, the catch in 1898 was valued at £128,707. There was a subsequent decline, picking up a little at irregular intervals, which continued until the effective demise of the industry just before the second world war, that is so far as Lewis was concerned. These catches of valuable herrings were not made solely by Lewis boats; the catches of many stranger boats, from the east of Scotland, must also be taken into account, to leave about 20 per cent as direct return to the island.

In 1938, the total catches of herring amounted to £98,000 for fresh fish and £162,400 for cured herring. This catch was obtained by 111 steam-drifters, five of which were locally registered at Stornoway, and some motor-boats, of which one-third were strangers. Harris has never been particularly prominent in the herring-fishing industry; shell fishing has been more profitable. In the years just before 1900, the average annual value of shell-fish caught in Harris was £2,306, only £500 below the Lewis figure. The Harris proportion of the aggregate herring and white-fish returns in the same period was just over £17,000, compared with the Lewis figure of £1,137,000.

228 *Since the second war*

75 Just before the second world war, Stornoway Fishery District
33 furnished some 10 per cent of the Scottish cure of herrings, which
35 averaged well over half a million barrels in 1937 and 1938, valued at about £1,500,000. Of demersal (sea-bottom) fish, the District

pared to make fishing their career, together with financial assistance to those who satisfactorily completed their training and who wished to acquire boats of their own. This Scheme is now run by the Highlands & Islands Development Board. The Board's participation in the expansion of the fishing potential around the island has been first-class, with commensurate results from an investment of some £500,000.

228 452 654

Illegal fishing

Like goldfields, the seas around the island have always attracted the unscrupulous, those for whom the word 'conservation' has no meaning, and who are careless of the dangers of over-fishing. Illegal trawling began around the year 1894 and by now has drastically impoverished the inshore fishings to which the Harris and Lewis crofters once looked for a supplement to diet and income. The rapid adoption of efficient trawlers was attended by an increasing number of reports of their poaching within the three-mile territorial limit. Though the islanders tried many times to involve the Government's cruisers for the protection of their shores, the poaching went on, and still continues today. Even some of the violence which attended the early attempts to clear the scum from the sea, as it were, continues, part and parcel of the island's sea-life.

685 226 175* [185]

Fish processing

A former freezing plant in Stornoway, run by the Herring Industry Board has been converted into a fish-processing factory. This facility, of great value to the port, is run by Rolf Olsen A/S, a long-established Norwegian company with a successful background in fish processing. The company has received investment aid from the Highlands & Islands Development Board, the Highland Fund and the Stornoway Trust; the latter's interest is significant in that it is the first time in which the funds of the Trust have been invested in a private concern, to help retain Stornoway as a successful fishing port.

228 [648]

The most regular shore-side as distinct from maritime industry is the processing of prawns (scampi, or *nephrops norvegicus*). Two firms buy the prawns at the pierhead, shell, cook and freeze them,

CH. IX ECONOMIC CHANGES: 1750–1919

175 From the Napoleonic Wars to 1914 the amount of
228 herring cured on the West Coast of Scotland rose and fell.
251 In 1810–14 the East Coast cure was half the West Coast
458 cure, but the peace of 1815 brought the capture of the Continental markets and the East Coast herring export leapt up. It averaged 500,000 barrels from 1850 to 1870, a million from 1880 to 1900, and one to two million barrels
[439] until 1914. With the decline in the export to the Plantations, the West Coast export fell, to rise by 1890 and reach a peak from 1900 to 1914. Thus, although no more than from a tenth to a fifth of the East Coast yield, that of the West Coast had risen greatly.[1] Of this, the Stornoway cure formed the major part.

175 The chief early type of catch, of white fish (cod, ling
228 and hake), was developed too, and swelled to a peak by 1900, then dwindled and fell. The average Stornoway District catch of white fish for a dozen years to 1900 was valued at over £100,000, much of it caught by local boats, and some of it cured at small 'creeks' (*e.g.* on the west of the Island, on Loch Roag, notably at Carloway). The cure, a strong coarse food, was shipped to Ireland and the Clyde; but after 1900, fresh trawled fish replaced the cured. From £100,000 before 1900 the value fell to little over £10,000 in 1912–13, £1000 in 1920, and half that in 1921—½ per cent of the value in 1900!

[471] Thus the herring fishing became the most important
[452] to the Islanders, at first by employment on East Coast boats. Later they purchased boats and gear for themselves, helped
[652] principally by advances from Island and East Coast curers, though also by State loans.

[1] *Fishery Board for Scotland*, Table 25 (1938), and Table 23: 6000 barrels in 1790–95; 80,000 in 1870–75; 100,000 in 1912, and 160,000 in 1913. For fair comparison with Table 25, about 25 per cent should be added to quantities, as explained in the notes to the Tables, on the 'seastick', and final reduced, or 'bungpacked', state of barrelled herring (listed in Table 23).

Types of ancillary employment

241 The question of the desirability of ancillary employment in a crofting district is often
464 debated. On the one hand, engaging in such work means less time for croft work and makes wholehearted participation in the agricultural life of the township a virtual impossibility. On the other hand, crofters who take ancillary employment are better able to make capital investment in their croft. Table IV shows that in Park, croft efficiency, as expressed by the souming
900 to actual stock ratio, is not necessarily related to participation in ancillary employment. If the township is to be re-established as a working entity, a clearer dichotomy in the population seems desirable; those who wish to work the croft on a full-time basis might be given full use of the available land, and those who wish to earn their living in non-crofting employment could take out feu charters for their houses. It is clear that the agricultural resources of Park are insufficient to maintain the present number of crofts as viable economic units but the problem of finding industrial employment for any large non-crofting population is very great.

184 The Park Association, in their keen search to attract industry, met with little response for
464 high freight rates and distance from markets made economic industrial costing well-nigh impossible. The Chairman of the Crofters' Commission has recently suggested that some of the Glasgow Overspill of "tradesmen and small businesses" might find "an opportunity to prosper in the West Highlands and Islands"[1] but even with Government grants for the establishment of small factories, it is clear that present freight charges would be a severe deterrent.

178 One possibility is that the fishing industry might be revived. In 1945, 16 large motor
228 vessels were fishing from the townships between Cromore and Gravir; by 1952, three boats remained;[2] only one boat was still fishing in 1958. The recent Fishing Board Scheme guarantee, which provides a flat weekly rate for every boat turning out, brings hope as this
[435] guarantees a minimum livelihood. The major problem is the finding of the initial capital
[452] required to buy and fit out a modern boat, at present about £20,000. Eighty-five per cent of this sum can already be found in the form of grants and loans from the Herring Industry Board but the remaining fifteen per cent or £3,000 is often the more difficult sum to raise. The Murdo Macaulay (Rhodesia) Trust has offered assistance to a limited number of fishermen towards the raising of the £3,000[3], and this offer is a real opportunity. If fishing is not re-started soon in Park, few of the original fishermen will remain to instruct the new generation.

484 Tourism is an industry hardly developed at all in Park. Lack of running water has made
[312] the householders shy to offer accommodation, but it should be remembered that there are city dwellers who are delighted to accept inexpensive accommodation away from the crowded resorts. Dr. Stig Jaatinen, in his "Human Geography of the Outer Hebrides"[4], states that this fact has made the Aaland Islands prosperous, and believes that tourism on simple lines could be successfully developed in the Outer Hebrides. Tourism need not bring in its train the desecration of the Sabbath for people who are willing to journey far in search of a quiet holiday usually conform to local observances.

464 Unless new sources of employment are brought to Park, it is clear that ancillary employment must continue to be sought elsewhere. The higher 'spending standard' in industrial employment, and the opportunities to find entertainment in urban areas (tastes often resulting from experience during school days in Stornoway or National Service), militate against a large population of young people, but basically lack of employment and the uneconomic nature of the crofts are the real reasons for the high degree of temporary and permanent employment away from Park.

EIGHTEENTH-CENTURY ECONOMY

but their negligence even in ye article appears from their sending out annual above 2000 of wool out of the country unmanufacture.' 439 175*

Harris was rented at £600. Exports were some 100 tons of kelp (£325), and the value of 250 black cattle exported alive, with 100 salted, was £445. Small quantities of cheese, wool, and the skins of sheep, otters and seals were exported. Grain was neither imported nor exported. [427] [435]

The plough, which is used here, and in most places of the long island, is of a very peculiar construction. Its length is but 4 feet 7 inches, and is drawn by four horses abreast. It has but one handle by which it is directed; the mold board is fastened with two leather thongs, and the soke and coulter are bound together at the point by a rim of iron. Beside kelp, there is little else manufactured, except a little coarse woolen yarn, and some blanketing, which they send yearly to Glasgow. They raise a little flax of which they make some coarse linen for their own use, but import all the fine linen which they consume. In the year 1756, an American vessel in distress was obliged to put out three hogsheads of lintseed in Harris, which was sown and afforded crops of lint which were above double the value of the usual crops. The east and west of Loch Tarbert in the Harris are every year revisited by the herring shoals. During the five years from 1743 to 1747, the west loch was the principal seat of the herring fishery. About thirty vessels from 18 to 40 tons, belonging to Campbelltown, Greenock, and Irvine, were completely loaded each of these years at this place. 407 175* [492] 175* 439 [286] [248] [177] 228 175*

With even a modest amount of business taking place, it was a natural step to establish commercial facilities. Stornoway men who once acted as agents became shopkeepers. The increase in the use of money attracted banks. During the Seaforth ownership of Lewis, the island had its own currency or notes, designed and printed from plates in the same style as the modern banknote. The wording ran: 'I promise to pay on demand to the Chamberlain of the Lewis or Bearer ONE POUND Sterling at the Counting Room here.' The notes carried a date and were signed by the proprietor, J. A. Stewart MacKenzie. It is not known for certain how long the notes remained in currency, when they ceased to be used, or even whether they were officially acceptable. At one time, as rare items, they fetched high prices from collectors. A number were 443 175* [453] 436 175* [523]

HARRIS TWEED

288 Today, with kelp long forgotten and fishing of minor importance,
[178] it is the Harris Tweed industry which supports many of the island people, either directly or indirectly; an island cottage industry with exports earnings exceeding £2,500,000 a year. Harris Tweed is exported to some thirty countries, including America, Canada, Australia, New Zealand, Japan and all the European nations. The industry is in fact the basis of prosperity in the area, both dependent upon and supporting the crofter-weaver working at
286 the handloom in his home. Seven million yards of tweed are
288 woven annually by the independent weavers 'on the books' of the
466 various mills. The weavers must finance themselves, buying their own looms and bobbins, equipping and maintaining their workshops. Though they receive their supplies of yarn from the mills, they are graded as self-employed persons and as such are not entitled to unemployment benefit—a subject which has caused much argument.

286 One of the most outstanding facts about the cloth is that its essential qualities have remained unchanged since the industry's early formative years. But it has astonishing versatility and over 5,000 patterns are available, including the crotal browns and the heather colours.

288 A weaver on average can produce about 2½ webs, or tweeds,
288 each week, a web measuring about 80 yd by 28½ in, and gets a
[465] reward of some £8 per web, according to the intricacies of the design or the number of colours involved. The money is paid out
[453] by a mobile bank making the rounds of the townships throughout the island. It is reckoned that the mills, for their part, make 1d to 6d a yard profit, depending on turnover; the total annual value of the industry's output is in the region of £4,000,000.

Between them, the five mills in Stornoway and the one in
[236] Shawbost consume two-thirds of the Scottish wool clip—the native Western Islands' crop is sufficient for less than a month's production. A thousand pounds of raw wool end up as 885 yards of finished cloth.

491 Brenish, at the end of the tarred road which also serves Islivig, is forty miles from
[484] Stornoway. On the thrice weekly bus the return fare to Stornoway was £1, and freight cost half-a-crown for a hundredweight, but because of competition from privately owned vans the bus service ceased in 1960. Mangersta is reached from the same road by about
[366] a mile of untarred side-road of indifferent quality; formerly the only access to it was by
[205] a footpath over the sands to the south. General merchandise, fish and meat are supplied
[453] by weekly vans; there are no shops. There is a post-office at Islivig; banking facilities are supplied by a mobile bank.

311 The majority of the crofts are long narrow strips, with those in Mangersta being some-
427 what more compact. The area ranges from two to nine acres, with an average of about four acres; in Brenish and Islivick only about half is usually arable. All the crofts - or croft-units - are fenced, the work having been completed in Brenish in 1959. There are twenty-nine crofts in the rental for Brenish, ten for Islivick and thirteen for Mangersta; but, owing to amalgamations of various kinds the number of operative units is considerably less - fourteen in Brenish, five in Islivick and ten in Mangersta. There are no cottars.

134 As soils are reasonably good and comparatively free from rocky outcrops, the arable
471 patches are large enough to be cultivated with a horse or tractor. There is a tractor in
[231] Brenish, and four horses, a horse in Mangersta and two in Islivick. All of these are hired for ploughing and carting peats. Very little work is done with the spade, unlike many of the other Uig townships.

233 While the general rhythm of township work through the year is similar to other areas, here the sheep are wintered up on the hills; some crofters winter lambs on their crofts. Brenish crofters are allowed to winter eight sheep, (or sixteen hoggs, or four year-old heifers), on Mealasta Island - hogge are usually sent since their loss, by falling over the cliffs, is less serious than the loss of heifers. Eilean Molach is used by Mangersta crofters, who are allowed two sheep each in summer.

241 The only crops grown are potatoes and oats, with "black oats" (Avena strigosa) on the sandy soils in Mangersta. Since seed for "black oats" is unobtainable commercially, the crofters save their own. A grass mixture is sown by the majority of crofters for hay, to qualify for the subsidy.

233 The extensive hill and mountain pastures are not separately fenced; sheep from all three townships graze over all. If the total sheep stock of the townships (about 3,300) is compared with the souming figures it is found to exceed the soum by about 50%. On the other hand, fewer cattle and horses are kept than formerly so that taking the total stock for all animals (horses, cattle and sheep) and comparing with the actual stock now carried, the area carries only 87% of the stock which the soum allowed. In the two older townships the souming was reckoned according to rent, being one cow, one two-year old and eight sheep for each £1. In Mangersta, however, the soum was one horse, three cows, one heifer, two stirks and twenty-five sheep for each croft.

Lambing percentage is about 80, and ewes form about 60% of the total sheep numbers
[236] (excluding lambs). In this district some wedders are kept for three years and then sold
[435] for meat, but the main income is from wool, about three pounds weight from each sheep, which sells at up to four shillings a pound.

231 Most crofters keep one or two cows, and the calves are normally sold in the autumn or spring sales. Brenish and Mangersta each have a bull, and in the three townships there are sixty-seven cattle and thirty calves. Shielings, formerly used for about seven weeks in

361 Many of the original houses are ruined or used as byres. Figure 14 shows that new
491 houses have been built near the sites of the old ones but sometimes nearer the road - all
[484] but four houses have easy access to the road. Crowlista is linked to the main road by
[493] two miles of rough gravel side-road, and by a footpath and ford via Timsgarry. Vans call
[205] but there is no Post Office, store nor bus service. At present water supplies are poor -
[366] two wells only are in use.
[489]
[312]

Carnish is served by a short unmetalled road and all houses have good access to this. Water supply is good; water may be stored on the high part of the crofts and piped into the houses. The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile away. This 'main road' from western Uig to Stornoway runs through Ardroil and all except one of the houses not near to it have good drives suitable for lorries. Ardroil has
[366] a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly
[205] and the travelling bank fortnightly. The thrice-weekly bus service to Stornoway (return
[453] fare almost £1) ceased in 1960 because of competition from privately owned vans and cars.
[484]

241 The cultivated land is in strips usually large enough for horse or tractor work; the
[231] smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil, and
[407] Carnish have one each and Crowlista none. Crofters hire these horses or tractors from Brenish or Enacleit. Oats and potatoes are the only crops grown in quantity, small patches of turnips are found and most crofters grow root vegetables. Kale was seen growing on one Ardroil croft; this was an experiment and seemed to be very successful. Bere and rye are no longer grown. Grass mixtures are sown in order to qualify for cultivation grants. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years ago was said still to be giving very good hay, but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour available. Crofters find this difficult to estimate as well, as often small irregularly shaped pieces are cut, and the figures, therefore, may not be accurate. (Appendix A).

One excellent garden showed that a rich variety of vegetables, fruit and flowers can be grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or interest.

242 Lime, dung and artificial manure are widely used, though on some Crowlista crofts
[134] the compound fertilisers were in use for the first time in 1959. Shell sand is used on the
[231] crofts which have peaty soil. Although it is agreed that seaweed and dung are the ideal
[324] fertilisers for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.

231 Each of the thirty-five operative units which carry any stock at all has a cow for domestic milk supply and manure. If the family is large or many visiting relations stay on the croft during the summer the calf has to be sold early; otherwise it will be reared until the cattle sales in September or May. Only eight crofters had two cows; fifty years ago four were commonly kept. Only thirteen of the units had young cattle other than calves. One crofter was rearing a kid for milk.

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

233 It was sometimes difficult to obtain factual information about sheep and it is difficult to generalise. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to two

Chapter 3

CHANGING ECONOMIC STRATEGIES: LAND, SEA AND LOOM

178 288 128 In Lewis, the change from a relatively self-sufficient community in which land and sea provided the economic base occurred in the context of the phenomenal rise of the Harris Tweed industry. In the following pages, the history of Harris Tweed is discussed in relation to changing strategies involving exploitation of land, sea and loom. Associated features of social life are discussed. Social boundary systems are defined and discussed in Chapter 4.

A. The Sea

175 228 [501] [491] • [494] Around World War I, nine boats, as long as 27 to 30 feet, driven by sails, used to go out regularly from the Shawbost harbor. From five to seven men, usually neighbors, had "shares" in a boat. They would go out fishing during the night and return the next day. "We [433] baited our lines with eel, for ling. We would catch maybe two or three hundred. I remember once we caught 1300."

175 228 [348] [439] [171] 175 648 228 On one of the crofts along the strand are the ruins of two curing houses, where the fish were salted and dried. Ling, cod, skate and halibut were cured and sold to local merchants for export. "The same as they do in Iceland this very day. That was the main industry. Then the English came with their steam trawlers; they ruined the fishing here, and then went west to Iceland and the Faroes. In Iceland they get fined for poaching, but here the trawlers often ignore [433] the three-mile limit. But the fishing was the mainstay here, before the Harris Tweed came along."

175 228 435 501 • [454] [491] One man returned from sailing in 1932 and bought a boat for L24. He had 32 lobster pots, and made L7 one June by selling the lobsters at a shilling apiece. Another man, who returned from the United States in 1934 because of the depression, bought a share in a 14-foot boat. It was made in Ness, at the northern tip of Lewis, [434] and cost about L14. He and his partners went out every night possible; the fish provided an important part of their income. The boat was sold in the 50's. "It wasn't 175 228 501 being kept up anyway." Around World War II there were as many as twenty boats; men fished at night, after a day's work. Today there are four 12-foot boats in Shawbost, 178 501 each shared by four or five men. The boats are used 228 intensively for fishing during certain times of the year,

241 654 Cultivation for subsistence is minimal, and in 190 part stems from government-defined privileges and duties 288 477 464 regarding maintenance of a croft. The Harris Tweed industry, which is restricted to the Outer Hebrides and thus is protected from competition, has provided work 166 [434] for a large number of islanders. Many of the younger members of croft families live in cities on the mainland, and send part of their wages home; they return regularly [162] [632] to the island, and many plan to retire there. Thus the township supplies urban workers who remain very much attached to the rural townships, which are composed of 511 • 454 273 aged family members and a rural proletariat. The standard of living is high, and many crofters have accumulated savings, although much of this surplus is used by the men for alcoholic drinks.

121 In Britain, rural communities have been interpreted as lying somewhere along a rural-urban continuum (cf. Southall 1959, Frankenberg 1966). In 1959, Southall presented "an operational theory of role" by which he suggested that heterogeneous societies may be analyzed and compared. He developed the concept "density of role texture" to describe societies which lie along a continuum from rural to urban. Frankenberg (1966) uses Southall's concept along with other concepts to present a more complete model of an urban-rural continuum. The "models" of both Southall and Frankenberg are essentially lists

205 *175 munication with the mainland. The mail will be dispatched from Edinburgh every Thursday at eight o'clock at night, and should arrive at Edinburgh every Tuesday morning, but the arrival will sometimes be uncertain.' The development of a postal service in the hinterland of Stornoway was slow. In 1833 only one mail packet ran each week to Lewis, sailing from Poolewe to Stornoway, weather permitting (see Chapter 8), and the island still had only the one post office. By 1880, of course, more contact with the outside world was expected and there were eleven post offices in rural Lewis, with Stornoway's promoted to Head Office status. • [494] The latter had been for some time equipped with a money order and Savings Bank department. The telegraph had also been introduced, though no connection to any of the country offices existed; 205 206 telegrams for all parts of the island other than Stornoway were, *175 as a rule, forwarded by the first mail dispatched after the receipt of the message. By 1902 there were twelve telegraph offices in the country districts of Lewis (Harris was incommunicado with Stornoway, coming under the Inverness-shire arrangements). Some of these offices were set up under orders of the Highlands & Islands Work Board, the service being carried on by the Post Office without guarantee against loss. The office at Port of Ness was subsidised by the Fishery Board and Lloyd's, who had a signalling station at the lighthouse there.

205 *175 [494] [505] [494] [509] Until 1926, when the long-universal red vans appeared, all mail was transported between the rural areas and Stornoway by private contractors, who used horses and latterly Albion coaches. A motor-launch operated between Callernish and Bernera; mails for South Lochs were conveyed across Loch Erisort from Crossbost to Cromore, and from Laxay to Kershader. In the early 1930s this area was served by mail van working between Stornoway and Lemreway. In 1950 full use was made of the existing BEA air service and, in order that mail from the rural areas could be included, additional main vans were outstationed at Lemreway, Callernish, and Port of Ness. These worked in to meet others working out from the town.

The Harris area was taken under the control of the head postmaster at Stornoway in 1937, having before this date been served by the head postmaster at Lochmaddy, North Uist. A mounted

324

or inquires about a person's plans, he says, "You'll do it 763 195
tomorrow, then, if spared."

Occasionally, a man's prestige status can be judged by 764 554
the foretaste the people have of his funeral. This, too, is
disturbing for the newcomers who prefer to face death when
the time comes. There is one member of the county people who
is extremely popular. Many speak of him as a "true Skyeman."
One day he was being discussed by a small group of women.
After talking about his interest in Skye and what a good man
he was, one summed up their estimation by saying, "Aye, what
a wonderful funeral he'll have." What higher compliment could
there be? The number who attend a person's funeral and,
recently, the number who drive to his funeral are indicative
of his status. Even though having a car does not give the [493]
owner prestige - to the contrary it may give the people cause
to wonder where he got his money - to have "friends" with cars
does give prestige. When 200 or 300 men join in the funeral
procession to carry the body to the grave, all the "people"
of the deceased take pride in telling of the "mobs who came."

In death we find one aspect of the crofter's way of life 764 454
which puzzles the newcomer, especially the government officials,
more than anything else. The old people hoard their money.
Welfare workers frequently say, "You never know how much they
have until they die." There are a few crofters, mainly returned
exiles, who are known to have money but continue to live in
tumbled down houses. The newcomer says, "They must like to
live that way." Quite to the contrary, the Sgiathanach has [761]
traditionally prepared for death early in life. Once the first

duty of a wife was to weave her windi
of burial merely buying a coffin. As
the people who attend a funeral must
they do not want subsidies to begin l
be buried with public assistance. Th

SEA-RESCUE WORK

But neither is Harris behind in willing men. In December 1962 the trawler *Boston Heron* saw herself on off-lying rocks and broken surf water in a full south-westerly gale. The rock island of Stilamair, off Scalpay Island, gave the stranded crew little hope of help. But six Scalpay men saw the plight of the ship and went out in a small open boat. Three of the trawlermen were saved, one of whom was found clinging exhausted to a rock. The other seven perished before more adequate aid could be brought. For their heroism, these Scalpay men were awarded Vellum Certificates by the RNLI. The attitude of local men to the sea, and the sea's treatment of men, was once summed up by an old Harrisman: 'Our men were brought up in the school that taught them that life was precious and that the soul was priceless.'

The formal organisation of sea rescue is found in the Coastguard Stornoway, the headquarters of the Stornoway District. This covers the north-west coast of Scotland from Ardnamurchan, Argyll, to Cailleach Head, the Minches and the associated sea areas, including the Small Isles, Skye and the Outer Hebrides —in all some 800 miles of coastline. The Stornoway station is base for a district officer, a station officer and four coastguardsmen, supported by locally-enrolled residents who form the Auxiliary Coastguard. Stornoway Coastguard is the launching station for the Stornoway and Barra lifeboats, advising when a launch is needed and calling out the boat crew by firing two green maroons. It is also a coastguard liaison station for the GPO Coast Radio Station (CRS) at Oban, and it co-operates with Oban and Wick as a radio-telephone station when lifeboats are launched on service. There is, in addition, liaison between Stornoway station and the RAF, the Royal Navy and Lloyd's: Lloyd's come into the picture when tugs, salvage and shipping information are required.

Though there have been many stranger ships and lives lost on and around the island's shores, local tragedies are not lacking. In December 1862 disaster overtook five boats from Port of Ness, out pursuing white fish. A fierce gale sprang up and the fishing-fleet perished, with thirty-one lives. Twenty-four widows, seventy-one orphans and thirty-one other dependents were left destitute, though they obtained some subsequent relief from a fund to which

information via the technology of mass society to affect the choices made by succeeding generations. For example, young people are able to leave the island and work in British cities or abroad, sending money home to sustain their aged parents who by law cannot be removed from the croft.

B. Changing Land Use

Darling (1955) described the previous Highland way of life as a well-adapted, ecologically balanced system, in which proper use of land was attempted by limiting the number of livestock, preserving a proper ratio between cattle and sheep, and regulating the flow of stock on the land throughout the year. Dikes (fences of turf or stone) and drains were commonly repaired and cleaned. Although continuity with the previous way of life is evident today, the overall picture is one of partial use, and misuse, of natural resources. Various pressures from government organizations and colleges have been brought in to encourage effective husbandry and land use.

1. Specialization and Individualism: The change from an ecologically adapted, internally regulated community in which land was used intensively for subsistence

Seasonal and cyclical unemployment 464	

175 In 19th-century Scotland, the cause of the High-
175 land tenants and subtenants was taken up, as part of
464 the trend of the times and because a series of famines
464 occurring in the Highlands caught the attention of
Britain. After the kelp industry was destroyed at the
beginning of the 19th century, landlords maintained
high rents on the assumption that the depression was
only temporary, which caused tenants to deplete their
capital by selling their cattle (Gray 1957: 38). A
number of reports were published on the plight of the
Highland smallholders: Fullarton and Baird (1850),
MacNeil (1851), MacKinlay (1879), and finally the
Napier Commission's report of 1884 which was followed
by the Crofters Holdings (Scotland) Act of 1886.

175 The 1884 Napier Commission Report tried to resolve
175 the conflict between the rights of the individual small-
464 holder and the maintenance of agricultural efficiency
in a situation which still had communal elements of
social organization, by recommending an organization
much along the lines of the old joint farm. The township
was defined as a farm, or part of a farm, which was
occupied in common or in division by several tenants.
The township, seen as an agricultural unit, was to be
given various immunities and powers by which to achieve

175 the 1914 decision to change the word "crofter" to
175 "tenant" led to the weavers living in council
464 houses in town and working in loomsheds behind the
houses. Unequal distribution has also contributed
to Shawbost's relative prosperity, and to the decline
of weaving in more remote parts of the island. The
unequal distribution of tweeds has made it difficult
to maintain a large labor force, which in turn limits
the growth and development of the industry.

2. Instability of the Industry: The Harris Tweed

Industry has undergone a number of crises. Periods of
depression have alternated with periods of prosperity.
See Appendix B for the fluctuation in the number of
yards stamped each year with the Harris Tweed trade-
mark. The very conditions which give the tweed its
238 value--the decentralized, non-mechanized human
441 elements--also limit the possibilities of growth in the
industry, and contribute to the industry's instability.

When a business remains small, it must collect
orders before it can provide work to have the orders
filled (except when demand for an item is strong, as
occurred around the time of the previous world war;
during the war and for a few years after, tweeds could
be made first and then marketed, because any cloth
could be sold). Only a large business can keep weavers

238 at work producing tweeds which it then tries to market.
441 The latter method requires the investment of a great deal
464 of capital to make the tweeds and pay the weavers before
a buyer is found. The small mills require an immediate
return for their capital investment, which is ensured
464 by not investing unless there is a definite order. The
fortunes of the weavers oscillate with the look and skill
of the mills in soliciting orders; thus, the mills do
not provide a constant, stable source of income. The
238 nature of the tweed, as a high-priced luxury item rather
441 than a basic necessity, contributes to the instability of
464 the demand. When fashions change or when world-wide
economic depressions come, the high-priced tweed with
its specialized image as a cloth for aristocratic,
sporty dress is forgotten for awhile. Efforts are being
made to change this image; but the product's status as
a high-priced luxury item persists.

238 An extremely small business can survive periods of
441 depression when capital outlay in the form of machinery,
464 running costs, and so on is not large. An extremely
large business that has cornered a large share of the
market can often survive an erratic schedule of orders
because it has a larger accumulation of capital, but a
medium-sized business has too much overhead to survive
long periods of depression. Examples of all three exist

238 in Shawbost: a very small business, which until
441 recently did not even have its own transport but
464 hired facilities when they were needed and simply
went into hibernation when orders stopped coming;
a medium-sized business, which went into liquidation
in 1971; and a large business, which continues to
survive despite a depression which has continued
since the late 1960's.

238 Harris Tweed is sent to markets all over the
441 world, but because of the difficulty of maintaining
464 a large labor force, the filling of orders is sometimes
slow. If large orders cannot be met, weaving as an
island-wide occupation cannot be maintained. The
fluctuation in the number of the island fluctuates, as slack
periods come and men adopt the time-tested strategy
of temporary migration in search of other jobs. One
of the factors which aided the weavers during their
strike of 1963 was the fact that so many other jobs
were available during the war that the future of the
industry was jeopardized.

238 In the last five years the number of mill employees
441 has decreased from 800 to 500. The decrease is due in
464 part to the introduction of more efficient techniques
and new equipment, but there is little room for improve-
ment in the production of tweeds because the human
element, the weaver, is essential to its production.

060 element, the weaver, is essential to its production.
293 In 1960 weavers receiving tweed yarns from the mills
441 totalled about 1,500 persons, a number which held for
464 about three years and then started dropping at a rate
of about 100 a year. In 1971 the number of weavers
was less than 1,000, and trends of change appeared to
prompt a continued dwindling of numbers. It is
464 estimated that emigration increased during 1970-71.
Men have returned to the new, have gone to Glasgow as
labourers, or have taken advantage of training courses
offered by the Labor Exchange, courses that will
eventually remove them from the island setting.

238 The instability of the industry and the fluctuation
441 in amount of weaving work available at any given time
464 has created an environment in which personal ties and
individual maneuvering rather than a widespread adherence
to impersonal rules such as equal distribution are
464 emphasized. Strategies which involve the mobilization
of kinship and neighborhood ties and involve an emphasis
on personal relationships rather than the depersonalization
usually associated with industry are made possible
by economic factors such as the dependence of decentralized
weavers on centralized mills. The watchfulness and
consciousness of one's neighbors on characteristic of
village life prevail. Questions about the state of

288 Questions about the state of
441 "the tweed" permeate all discussions, and often
464 constitute an initial greeting. "Have you got a
tweed in the loom? How many do you have? Did you
see Shickey's tweed van going into Paire? Did you
hear that Newills has an order for about 800 pieces...?"

"The mills brought me two tweeds, and I got two
in town myself. I stuck those two in the attic so
that anyone who came in would be none the wiser," says
one person in a whisper. Neighbors are in and out of
each others' houses and loomsheds, observant and
questioning, on the lookout for any indication that
they have based out on some transaction in the
competition for scarce goods.

B. Weaving as Strategy

When weaving was done on a wooden hand loom, the
weaver required a longer period of apprenticeship.
Weaving was "more of an art," as some of the older
weavers remember it today. Not only was the shuttle
thrown back and forth by hand, but the lifting of
different threads in the warp was done by manipulating
four foot pedals in the correct order. Today, the
process of weaving is very much simplified; the weaver
pushes only two foot pedals, and simply keeps an eye on

241 The Department of Agriculture dispenses subsidies to
654 all Scottish farmers, not just to crofters, and handles
933 about 220,000 claims per year. Lewis produces 0.4%
of the agricultural output of Scotland, and 8.1% of the
agricultural output of the Scottish islands.

654 The major subsidies available to Scottish farmers,
235 including crofters, are for raising hill cattle, beef
calves, and hill and upland sheep. Sheep and cattle
subsidies were made available in 1941, in the early years
of the war, to increase their production. During wartime,
Britain was more dependent than formerly on her own
resources, and attempted to encourage production. Between
the two world wars, agriculture had undergone a recession,
especially in the hills and uplands, because of a number
of events in world economics, such as competition from
New Zealand and Argentina in production of cattle. As
part of the scheme of the postwar Labor government,
agricultural support was made statutory.

For example, a man who keeps hill cattle may receive
L18.70 per cow as well as L5 for each acre cultivated to
feed his cattle during the winter. He receives L5 for
each cow which is tested for brucellosis. In the 1970-71
agricultural year, Shawbost received over 12,000 in sheep
and cattle subsidies, divided among 37 men receiving
subsidies for cattle and 36 men receiving subsidies for
sheep.

293 The Harris Tweed industry has provided a higher
494 standard of living, but income from this source is
inconsistent. The standards developed during prosperous
times cannot be met during difficult times. Many-roomed
256 houses with indoor plumbing are more heavily taxed than
264 smaller, less modern homes; houses must be repaired;
a car and a television once gotten are difficult to
294 give up. A weaver must pay for his insurance stamp,
261 which amounts to over L70 a year; and income tax takes
a large percentage of a person's income, in large lump
sums which are paid twice a year rather than in small
amounts throughout the year. When income fluctuates,
any constant demand for monetary outlay constitutes a
liability.

654 To meet persons outside the island concerned with
181 Highland and Island development, Lewis has a reputation
for "subsidy-grabbing." According to one official,
"The people are too used to getting subsidies. They
tend to sit back and rely on the subsidies, which
makes it difficult to develop the place."
829 "We pay tax," said one weaver. "Why not get back
what we can in subsidy?"

Income tax collectors shake their heads in despair
654 at the thought of trying to get a fair estimate of a
9.3% crofter's income, except for jobs such as weaving for

65/ which official records are kept by the mille. If you
439 say jokingly to a fisherman who has brought in a large
catch that he should put some money aside for the
income tax man, he is likely to reply, "He'll have to
463 catch me first." A tradesman may be earning large sums
439/ of money doing local work as a skilled specialist at
[245] the same time that he is collecting social security.
A man may move in and out of a number of different jobs,
and never report his income. "Occupational pluralism"
[171] (cf. Brox 1966) rather than economic specialisation has
developed as a strategy in various countries along the
North Atlantic fringe, such as Iceland, the Faroes,
northern Norway and Newfoundland, as well as the west
coast and islands of Scotland. In these marginal areas,
income from specialised occupations is, in the long run,
unpredictable and inconsistent.

In times of national economic depression, strikes,
198 wars between nation states and conservative governments,
241 and other crises, crofting provides an alternative
195 strategy. During the last war, many islanders who had
222 left the island (including some who had been quite
166 prosperous in the cities) returned to spend the duration
of the war in the village, glad of the relative security
provided by the relative abundance of food and less strict
000 rationing. During a huge snow-fall that occurred on

195 During a huge snow-fall that occurred on
24 Jan. in the 1950's, the mobile grocery vans and other
182 supply vehicles could not come out to the west side,
[409] and a group of men had to make an expedition into town
for provisions, after which many families made certain
that they always had a good supply of meal, salted
[404] mackerel and herring. Many villagers have gotten deep
[345] pressers to store beef and mutton; others say they do
not trust the freezers, that a failure in electricity—
which occasionally happens in this region of gales and
far-away repairmen—would bring disaster if they depended
fully on them for keeping their meat. When the tweed
* 459 industry is going through one of its periodic depressions,
222 more men go out more often to fish. "I've been going
out every night for the last week or so. I don't have
a tweed, and I won't have one for the next six weeks.
I don't know what i'm going to do; maybe I'll go back to
sea. Three of us caught one hundred mackerel last
[251] night. I salted my share, and didn't give any of them
away. These are the fancy ones. We're going to feed
them during the next six weeks."

232 A few people raise beef cattle, depending largely
[459] on subsidies for encouragement to do so. A few are
[234] beginning to keep cows again for milk, giving as their
[190] reasons that freight charges make the bottled milk too
[459] costly.
[448]

* 157 With his brother-in-law, but they had only one loom.
[288] At that time the mill was buying yarn from other mills
in town, warping it on the mill premises, and sending
it to the weavers together with the yarn for the weft.

Ruaridh beard through the grapevine that more warpers
were wanted at the time, and went to ask "the old man,
Coinneach Rod, himself," about the possibility of his
[145] getting the job. He worked with five other warpers, who
averaged five warps a day, at four shillings each. They
were paid by piece work rather than on an hourly basis,
and received payment once monthly.

Business was going very well. The mill was receiving
large orders from America. A few more warpers were hired.
* [158] A slump came in 1948, and Ruaridh Dan and several others
[292] were laid off. Ruaridh went to work for a building contractor,
[406] but was called back to the mill after a month's time.

After weaving for several years, he started work in
* 157 the yarn store, which dispensed yarn to the weavers.
[444] "I was checking the yarn that was going out to the weavers,
weighing the wefts, checking the colors that were used,
keeping a record so we could tell at a glance what stock
we had, how much we would require for any further orders
we would get. Well, the job got to a stage where I just
couldn't manage it, and I protested. Another man started
to work with me. I was paid a regular wage so it was a

* 159 they leave school, and most of them get married. I
[288] remember about twenty girls working there, and they all
[468] got married, and another young girl would start. During
the slack periods some men would be paid off. They
would start in other jobs, and wouldn't be prepared to
* 159 come back. If you weren't working in the mill you were
[464] weaving; there was road work on a very small scale.
Except for sailing there was nothing else. For the last
ten years or so the big contractors have given people jobs.

"I started with a building contractor but preferred
to come back to this job, for the main reason that I had
* 159 built this house here. We had slack periods, but we
[292] picked up again. But this slack period, it's been two
[406] years now, and I don't think it will pick up again,
unless they go to a wider cloth. Probably the fashion
has changed. People have gone on to other types of cloth.
And the merchants and tailors prefer a wider cloth, it's
less waste. But that means changing the loom and a lot
of machinery in the mill as well.

"I'm sure the weavers wouldn't be prepared to put
[495] out the extra cost for wider looms. At the present time,
* 159 a loom and winding machine cost close to £400. You can
[368] imagine what a wider loom would cost, up to £1,000. The
[143] don't want the power loom. They're trying to hold onto
[435] the Orb tradesmen for as long as they can. That's the big

* 159 question, whether it would be better to change from the
[464] Orb trade and go to power looms. Then you would be
[455] able to do any kind of cloth. You wouldn't be tied down
to regulations as you are with the Harris Tweed. To do
that after all it cost them with the court case a few
years back—. But, at the same time, it's more important
to have work than this tradesman's. As it is at the
moment, it's just a white elephant."

Neille Leoid

* 159 Neille Leoid left school in 1931 at the age of 14,
[288] as easy-going and generally content with things then as
[226] he is 40 years later. "When I was going to school lots
of people hated the headmaster, but I had no complaints
against him. Perhaps people are inclined to blame other
people for their own failures. Of course, I didn't like
school very much, and I didn't go to it all that often.

"In those days you didn't have the same access to
education as the young people have today. You didn't
* 159 settle down to go very high. You were quite content to
[368] settle down to weaving. The boys started learning from
[471] anyone who was around. I started weaving with my uncle
[444] when I was 15, on an old wooden loom. In one winter
[435] we earned the £26 to buy a single-shuttle automatic.
My uncle's eyesight was getting sort of dim, so I would

From the Napoleonic Wars to 1914 the amount of
195 tweed on the West Coast of Scotland rose and fell.
222 In 1810–14 the East Coast cure was half the West Coast
[224] cure, but the peace of 1815 brought the capture of the
* 458 Continental markets and the East Coast herring export
leapt up. It averaged 500,000 barrels from 1850 to 1870,
a million from 1880 to 1900, and one to two million barrels
[439] until 1914. With the decline in the export to the Plantations, the West Coast export fell, to rise by 1890 and reach
a peak from 1900 to 1914. Thus, although no more than
from a tenth to a fifth of the East Coast yield, that of the
West Coast had risen greatly.[1] Of this, the Stornoway
cure formed the major part.

The chief early type of catch, of white fish (cod, ling
195 and hake), was developed too, and swelled to a peak by
226 1900, then dwindled and fell. The average Stornoway
District catch of white fish for a dozen years to 1900 was
valued at over £100,000, much of it caught by local boats,
and some of it cured at small 'creeks' (*e.g.* on the west of
the Island, on Loch Roag, notably at Carloway). The
cure, a strong coarse food, was shipped to Ireland and the
Clyde; but after 1900, fresh trawled fish replaced the
cured. From £100,000 before 1900 the yield fell to little
over £10,000 in 1912–13, £1000 in 1920, and half that in
1921—1 per cent of the value in 1900!

Thus the herring fishing became the most important
to the Islanders, at first by employment on East Coast boats.
Later they purchased boats and gear for themselves, helped
principally by advances from Island and East Coast curers,
[470] [444] [435] [251] [224] [439] [226] [195]

[1] *Fishery Board for Scotland*, Table 25 (1918), and Table 23: 800 barrels in 1790–95; 80,000 in 1870–73; 100,000 in 1914, and 160,000 in 1913. *For fuel comparison* with Table 23, about 15 per cent should be added to quantities, as explained in the notes to the Tables, on the 'assistit', and final reduced, or 'homegrown', sums of barrelled herring (listed in Table 23).

COMMUNITY FROM PAST TO PRESENT PT. II

195 though also by State loans. The efforts of the Island
222 fishermen in the sixty years from 1880 to 1939 can be
228 summed up in the values of their boats. From 1880 to
[171] 1900 values rose by one-half, but had fallen somewhat
* 458 before the war of 1914–18 (to £70,000). Immediately after,
the purchase of steam drifters at Stornoway and the fitting
their herring boats with motors by the fishermen had
tripled the value (close on £70,000 in 1920). But markets
fell almost at once, and losses continued. By 1938 the
Island fishing fleet was valued (or overvalued) at a quarter
that figure, and was worth less than the fleet of sixty years
before.[1]

(b) THE CROFTERS ACTS, 1886–1919: TOWNSHIP, LANDLORD AND STATE

195 Centuries of cattle-keeping having left the grass moors
222 in good condition, the profits of sheep-farming rose after
[224] 1770 with the price of wool for manufacture. Protected
from foreign by modern guns, and handled in large flocks,
the newly introduced Cheviot and Blackface sheep and
[178] lambs could graze in their thousands. In many estates the
introduction of additional sheep, with the crofters' cattle,
was tried and worked; but in others the people were
195 ruthlessly evicted. Although offset by many acts of wise
232 economy and generous aid, evictions were too frequent
[477] during the next half-century, and they engendered growing
bitterness.

Whereas in other Isles, and on the machar of Harris,
the small joint tenantry and subtenantry were evicted in

[1] Figures 1848–73 quoted from J. P. Day, *Public Administration*, 1918; 1888–1900 from Appendix K, Report, 1902; 1912–1918 from *Fishery Board for Scotland* Tables (Table E.1B, 1912–13, and Table 14 and A.L. 1918).

CHAPTER X

BETWEEN TWO WARS, AND AFTER: 1918–1939

(a) SEVEN YEARS' ENDEAVOUR, 1918–1925

1. A Planner: Lord Leverhulme of the Lewis

227 * TOKING back to the aftermath of unemployment
[468] following the First World War and forward to anxieties
ahead, a soldier in 1944 protested that it would be
exacting too great a sacrifice from the country's manhood
to throw it unaided, upon "the hazards of peace", for the
second time in a generation! If Island life is to be planned
for in the ensuing peace, we must ask, "What of plans last
time?" Depression in the Island was not primarily due
to the failure of any one of the three parties immediately
concerned—to the Islanders, the crofters, cotters or fishermen, to the Scottish Office or its Departments, or to a
particular philanthropist—nor even to failures by all three
to get together for the Island's good. All three may deserve
their share of praise or blame; who might not, stranded
[144] without warning by such an ebbing tide? Behind the
personal factors on which biographers and writers have
insisted, in retelling Leverhulme's Island adventure, larger
forces were at work, undoing the efforts of all. Further,
by undermining confidence and preying upon anxiety,
disaster upon an international scale brought the Island
consultations from unity to feud and to frustration.

CONTINUED ON NEXT FICHE

which the Isles form the outermost fringe. Particular aspects of the Island's problem were its own.

The application of 'the Means Test' was therefore to the good in the Isles to begin with, whatever was to be said for or against it in towns. Many honest crofters thought the test should have been much more rigidly applied in the Islands. In 1932, after the worst of the depression had passed, there were in Lewis (proper) some 750 registered unemployed men (with only 5 boys), of whom 250 were seamen from the Merchant Service; and the other 500 included dockers and casual labourers of various sorts, many of whom had returned from the cities. The seamen, to take the largest class, constituted one for which relief was thoroughly justified; unemployment benefit was paid to each man until he had been unemployed for over six months. The Public Assistance Committee then gave 'Transitional Payment' after applying the Means Test, in which they took the produce of the croft into consideration. Public Assistance might follow later. Out of 250 cases, soon after the Means Test was applied, there was none in which the Committee assessed the need as equal to the benefit formerly received. In the Lowlands, on the other hand, the real need was usually found to be greater than the 'benefit' paid, and therefore relief could not in fairness be reduced.

There were years when work at sea was not to be had. As one left the Firth of Clyde, by the railroad to the Isles, one could count sometimes a dozen, sometimes a score of good 'tramp' steamers dossed in the Gareloch; and one thought of their crews, good men, but idle and rusting too. At such a time reduced payment to Island seamen with a croft, in place of total payment to town-dwelling seamen without one, effected a saving to the public purse. The

458 problem remains that Island seamen may thus continue
746 indefinitely to be crofters receiving partial relief, seamen only in name. Without doubt, part-time work on a croft is socially a lesser evil than prolonged unemployment in a slum or semi-slum. The crofter's family, too, is relatively better reared than that of many a poor seaman in Glasgow, Liverpool or Cardiff. Yet if this were all, it would be no adequate life for a man, while continuing to be an expense
[461] to the State. The more satisfactory side of such relief is
[311] that the Islanders, when unemployed, turn to building new 'white houses', and either to making small improvements on their crofts, or as in Ness (a progressive village with a high proportion of seamen), to the reclamation of new holdings on 'skinned land'. In all such cases a means test provides against full payment to those who could do without.

458 To women normally employed in 'gutting', unem-
746 ployment relief is given only at such time as there is no
462 work during the season when it might be expected, *i.e.* from May or June to December. Gutters from the Island
[228] are busiest for the months from June to August on the West and East Coast of Scotland, and again for two months, from October to November, in East Anglia. The number of Lewis women normally employed was over 1500 in a typical season (1930), the earnings averaging £19 each for the summer fishing in Stornoway, and as much again for the gutting in East Anglia. But the demand fell, and by 1932, for instance, some 250 women were obtaining relief, through Stornoway, in early August, the number doubling during the slack months from mid-August.

181 The tragedy and the danger of any means test are that
458 in effect it asks, not "How prosperous can you become
746 if given help?" but "How poor can you become to qualify

181 for help?" In one of the Outer Isles, I know of one or
458 two crofters holding fifteen acres of arable, with a share of a good outrun, who have let their stock dwindle and
746 deteriorate, and their crofts lie mostly fallow, though these could support a horse or two, several cows, and fifty sheep. After having found some casual labour, they discovered they could live mostly idle 'on the dole'. Self-respecting neighbours suffer: good families who prefer to be independent of 'Assistance' and to improve their croft
[476] and stock, and the outrun too. These find their stock deteriorating for lack of co-operation in breeding, fencing, and other communal duties, and see their crops invaded by weeds, blown from a lazy neighbour's plot. While an idle neighbour benefits by their industry, they themselves are losers.

In another island, a hard-working crofter lost a score of good lambs through 'worrying' by the dogs of an idle neighbour, whose own stock had dwindled to a trifle. He was finally awarded legal compensation; but he found it wiser not to exact it, for the unspoken threat of exaction
[476] gave him a hold upon the idle 'dole-drawer'. The worker could still insist that the idler pay his share of the cost of
[626] posts and wire for a fence on the outrun, or contribute the minimum hours of labour due for fencing and other
[461] statutory tasks in the township. Men like that idler sap
181 the urge to work. They lower communal morality to a semblance of the social code once too commonly seen by Islanders in the domestic service of the upper and middle classes, a code by which chronic idleness was disguised as 'leisure' and conspicuous dependence upon the work of others was honoured as 'independent means'.[1]

[1] A summary of production, and figures of productive and non-productive income, are given in Appendix I.

458 How then can the situation be assessed, as it was before
178 the outbreak of war and since then? By 1939 twenty years had been partly lost; for the after-war years of the 'Leverhulme boom' were followed by discouragement and poverty. During that time one might have hoped for half
[423] a generation of reconstruction and progress. On the other hand the sore question of dividing the farms was settled, so bringing raiding to an end. Congestion on the existing crofts is less than it was, owing to this fact, and to the
[166] provision of feus. The poverty of many breadwinners who had migrated to the cities first cut down the amounts remitted to their Island dependents, then drove them home.
[433] A croft, or even a garden site, and the opportunity of building a good house there made life still worth while,
[746] when other employment had failed. Unemployment relief, though tempting some to idleness, gave a respite
[286] which many utilised to make a fresh start. As fishing
[226] waned, many had taken advantage of the easy beginning offered to learn a new trade—weaving. This has made many feel that the living to be found on the Island is better than alternation of 'wage-earning' with unemployment, in Glasgow or abroad. They believe the situation
[311] of the Island community to be hopeful. While the land remains little better than before, many, even of the younger people, still care for the Island life among their own kin. Given a clear lead, these could reorganise themselves, and undertake the developments needed in fishing, weaving and reclamation. The homes are sound, 'good neighbourhood' endures, and given fresh opportunity, the community could awaken to new life.

178 During and since the war, co-operative marketing was
44
476

For a year or two after the war many men and women returning from the Services, the sea or the factories found employment in the flourishing Harris Tweed industry. This included work in the spinning mills and hand-weaving at home—work in which the male weaver was helped by his family in jobs such as bobbin winding. Few fishermen dared to sink capital in new boats and gear, and risk losses such as those sustained after 1920. Few women wished to return to the hard, uncertain work of gutting. The whaling station, built on West Loch Tarbert before 1914 and open for a short time between the wars, was reopened in 1950, and employed some 30 men for 18 months before it closed in 1952. Crofting was lightened by some mechanised cultivation. The war-time construction of air-fields had ceased, though some harbour-work and road-making was assisted by government grants.

In 1949 the Harris Tweed industry, now the Islanders' main source for earning, was crippled by the imposition of a 66⅔ per cent purchase tax on hand-woven Harris Tweeds. Parliament decided that as a non-utility product, its export sales alone could be exempt from tax. Viewing the position of the tweed industry in Britain as a whole, there were strong arguments for the extension of the tax to Harris Tweeds: the high-grade industry of the Scottish Border or the manufactures of the West Riding should not be subjected to unfair handicap. At the same time the crippling of a handicraft practised by peasant or artist favours mass-production to the loss or ruin of traditional and experimental workmanship or design to which, in the end, the mass-production is an unacknowledging debtor. The obvious economic handicaps of Island hand-weaving may surely permit some latitude. The export trade in Harris Tweed, in which the imponderable 'sentimental

value' is important, is an appreciable dollar-earning asset; and because of the fluctuating export market, its manufacturing must be stabilised by sales at home.

These and other facts support the plea that if some share of taxation had to be imposed in the national interest, it should have been done by steps to permit of readjustment in manufacturing and of adaptation to the carefully fostered market. What seems indefensible, even in the national interest, was the imposition of the full 66⅔ purchase tax. As a result of this blow, the crofter's web could not be sold, and lay, a prey to moths, in his home, while the mill-owner's stock piled up in the warehouse. 'Hand-looms', newly bought or partly paid for, lay rusting in the sheds and the machinery of the mills stood idle. The hand-weavers with their helpers and the employees in the mills, their savings spent, began to seek work beyond the Island. As the census of April 1951 has shown, the population has been falling as workers trickled away by every steamer. Some adjustment was made, it is true, late in 1951; but the case of the small independent weaver remained as hard as ever.

The amount of tweed stamped with the Orb Trade Mark, which diminished slowly from 4,464,000 standard yards in 1948 to 4,101,000 in 1949 and 3,780,000 in 1950, fell when the tax was imposed to 2,800,000 in 1951. In 1952 there was a recovery, maintained in 1953. Over 5,000,000 yards will have been stamped in 1954.

An effort has been made to separate crofting from other income, and also to average the income from the sources given of the total rural households, numbering 4700, composed of those on the 3650 *occupied* crofts plus an estimated 1050 others, namely, cottars and squatters, and 'feuars'—*i.e.* holding land in feu.

Finally, to the productive income earned on the Island there should be added that received by earnings sent or brought home to dependants, together with pensions, unemployment relief and the like. I am greatly indebted to the appropriate officials for the figures cited for 1937–38 or the year immediately preceding. These sources average £45 per rural household. The figures tabled all apply to Lewis alone; but many figures having been obtained for Harris also, conclusions are similar there. The concluding Table (pp. 314-315) bears a note on other sources of income, with a similar table for 1953.

(i) *Tweed Industry*

After deducting the cost of wool imported from the mainland and certain other costs, the net productive income was taken to be £307,000. The estimate may still err on the high side but it indicates the prime importance of the industry in the Lews. For 1938 the quantity of tweed stamped, and certified as hand-woven by the Harris Tweed Association Ltd., was 2,830,900 imperial yards, rising in 1939 and 1940 to 4,000,000 yards, though falling thereafter. The value of the tweed produced in 1938 was approximately £500,000. The total wages paid in 1938 amounted to £140,000 (£139,600), rather more than half of which was paid to the weavers working at home. In 1940 this had risen to nearly £200,000, a slightly higher proportion falling to the weavers.

In addition to the wages paid and the price paid for local wool, the industry is a valuable customer of the Electricity Company and directly or indirectly provides much other employment in the Island. The industry also provided a market for a large quantity of Scottish wool and contributed to taxation.

The productivity and earnings of the industry continued to

159 and he was unable to make plans or promises for the future.
433 Meantime, it should be said, the Island herring catch and
458 prices fell rapidly (the catch by 50 per cent and prices by
[228] 60 per cent from 1920 to 1921). As a result, crofts now seemed more precious than ever to the applicants.

159 With what Leverhulme regarded as 'almost indecent
423 haste', the Secretary for Scotland proceeded to fulfil the
654 promise to divide the farms. Most of the farms remaining were divided into some fifty crofts, of ten acres or so with outrun, supplying little more than 10 per cent of the landless men. The Manor dairy farm, near Stornoway Castle and town, though raided by a few men, was retained to contribute to the town's supply of milk, along with two or three smaller farms close to Stornoway (Melbost, and Stoneyfield with Holm). Leverhulme felt that his offer to Lewis had been turned down, and he then concentrated his efforts upon Harris.

159 At the extreme south of Harris (midway along the
433 south-west coast), in the 'Hope' or natural harbour of
228 Obbe, Leverhulme built new piers. He transferred the machinery of the canning factory and the kippering sheds he had commenced to build at Stornoway. He started to build houses, a number being provided on generous terms; and "at the people's wish", the settlement was renamed Leverburgh. With the transference of his energy from Lewis to Harris, Leverhulme's "optimism and determination were intensified", wrote his son. They were not to last long. After a visit to the Congo in 1925, Leverhulme died suddenly in Brussels. How far the new plans might have succeeded had Leverhulme lived, his son has commented, "remains uncertain". What is certain is that the second Lord Leverhulme toured Harris, visiting the works on hand and examining the accounts. No doubt he also

schemes, and knowing how much local fishing depended upon international policy, particularly the resumption of trade relations with the chief customers of the past, Leverhulme, one feels, should have dealt no less outspokenly with these. The removal of trade barriers lay not in the hands of the Scottish Office or of Scots officials (however internationally minded these might be as private citizens), but in the hands of Ministers of Cabinet rank and leading financiers, of whom Leverhulme himself was one.

In brief, the Scots fisheries suffered after the war as neither Leverhulme nor others had foreseen when first he laid his plans for the Island's prosperity. It seems clear that had this major change been squarely faced by Leverhulme and Government alike, in 1920, 1921 or even later, they could never have fallen apart about a relatively minor issue, that of the farms. Both sides turned their faces away from this disquieting factor of the Baltic markets, though both knew it to be fundamental to the success of Scots fisheries and the Island's future. Had they faced it together frankly, then, even if powerless to effect a remedy, their sincerity might have prevented a deadlock upon a secondary matter.

To Leverhulme, given his large scale of expenditure and return, the division of a few farms formed a minor issue. But to a number of ex-Servicemen, 'crofters' without a croft, the division meant a home and relative stability. Moreover, what was merely a matter for personal decision to Leverhulme, was a lifelong issue to many people brought up in congestion on the wrong side of the boundary fence. Meantime, milk from Easter Ross was available in Stornoway, at town if not at country prices. Lastly, further possibilities of land-development lay open to Leverhulme, though not so readily to the unaided people. In reading

estate, or where a single lodge was bought as a home for retirement, depopulation might not matter. Certain populated parishes, however, were bought as investments by men of comparatively modest means. The principal reasons for his purchase given to me by a retired man, formerly connected with the administration of the Lews estate, were two. Asked if he had found, and expected, steady, remunerative payment of rent, he replied: "Certainly!" Next, in view of Press forecasts of general emigration, I referred to the fact that if large numbers of crofters decided to give a year's legal notice of departure and apply for compensation for improvements, including the erection of a 'white house' (otherwise than by Government aid), the landowner would be faced by heavy liabilities while deprived of income. Had the purchaser no fear of such an eventuality? "Certainly not!" was the reply, "the crofters will stick to their homes for many a long year."

These examples show that, while the defeat, or non-realisation of Leverhulme's schemes, seemed to many outsiders the beginning of a not distant 'end' to the Island community, the Islanders themselves did not contemplate a final exodus. They were quite uncertain what was to come, it is true. Who was not, in those years of discouragement for Scotland and her people, for Wales, for Tyneside and Lancashire? The years of Leverhulme's departure from Lewis and of his death brought bad seasons. In 1924 storms destroyed crops and the peat would not dry. Herring catches and prices, though they had risen a little since 1921–22, had not allowed recovery from the losses sustained. The cessation of Leverhulme's wage-payments meant a gap in income which the Islanders could not fill at home. To relieve poverty in 1924–25, a Highlands and

Islands Distress Fund was raised in the Lowlands. The Committee organising it distributed relief, and purchased seed potatoes, etc. They also drew attention to some important features of Island conditions. Among others was that of the scale of charges for transport of goods and passengers. These charges had risen by from two to four times what they had been.[1] The steerage passengers were poorly provided for; and a later improvement in cabin comfort was not accompanied by improved steerage accommodation. One remembers in particular the suffering of the 'fisher girls'. In good weather the passage home (by day) was bearable; and though the song that 'lifted' as the boat left Kyle for the last lap to Stornoway sank pathetically as the steamboat left the shelter of Skye, voices began to rise again in the shelter of Stornoway Bay, sounding clear as the boat drew in. In bad weather the crowded women suffered sorely. Five hundred might be packed on the deck with little or no shelter, or covered the benches and floor of the steerage, sick and distraught. The Committee pointed out that "the Government increasingly accepted responsibility for the roads of the kingdom", and that sea communications were even more vital than roads to Islanders, for they serve in place of both road and rail. Some action was taken, but charges remained high.

As a result of all these difficulties, many young men

[1] Examples were given of the rise in charges from 1914 to 1924, *e.g.* a web of tweed, Harris to Glasgow, from 1s. to 3s.; a box of lobsters, Harris to London, 4s. 6d. to 11s.; a barrel of herring, Stornoway to Kyle, 1s. to 3s. and so on. Although the rise on larger consignments was less, these were of no benefit to 'small folk'. Typical charges for the export of livestock were: (Lochmaddy, N. Uist, to Oban, or from Harris) for sheep the rise was from 9d. to 2s.; for lambs, 6d. to 2s.; for horses or cows, 5s. to 18s.; for stirks, 2s. 6d. to 11s. 6d. The Committee's report was privately printed.

fragments of spars and other needful things lacking on croft and moor were picked up and carefully allotted. So, after 1919, from the wreckage of modern industry borne on the ground-swell of 'Depressions', there came to the Islesfolk the frail raft of unemployment relief, doled out like driftwood long ago.

Some assessment is therefore required. The total amounts of relief disbursed before 1931 were comparatively bountiful; and they certainly exceeded the sum of the crofters' contributions to the Unemployment Insurance Fund. After a couple of months of wage labour at road-mending, harbour-repair, or the like, young men were qualified for 'the dole'. Furnished with this, they returned to the croft when paid employment gave out, to cart in their peat, collect stones for a new house or saunter out with a rod for a little fishing from the rocks. All this was done 'on the dole', with complete legality, so long as their names were duly inscribed at Stornoway Labour Exchange as seeking fresh employment. Not a few prayed that 'employment' would not come inconveniently soon, as they would then be legally bound to accept it and to leave the croft. No doubt, even if only a part of the money received was urgently needed, the surplus was not squandered, as it might have been in a town. Extra cash, if any, served to buy a loom here, fencing for the garden there, and other things of permanent use. Yet morally it constituted misappropriation of relief. As a result, through no real fault of their own, young men began to lose independence and self-respect. This general problem for youth was widespread in years of 'depression', and it was peculiarly severe both in industrial Clydeside and the fishing villages of Scotland, and also throughout the 'depressed areas' of northern and western Britain, of which the Isles form the outermost fringe.

185 In 1919, when the men came home to Lewis they could
727 still see reasons for hope. They found a strange proprietor,
known first for his outstanding—some said ruthless—
157 business ability, and only secondly for his philanthropy.
They heard his plans and were inclined to listen.

185 Yet, remembering their pre-war losses and the notorious
fluctuations of prices and employment in the fisheries, they
wished for a policy of insurance, as it were; so, if their
home lay near a promised farm, of which they had long
159 meant to claim a share, they claimed this forthwith. Only
458 too soon after, in the early years of Leverhulme's adventure,
the fall in total sales and prices of fish brought immediate
433 loss to the keenest and hardest working of the fishermen,
228 and to their financial backers in Stornoway. These losses
warned others of the uncertainties of fishing. Now the
fall in the fishing industry is not so much as mentioned in
the biography of Leverhulme; nor do we remember a
654 word of it in Leverhulme's speeches. One finds no data
to show a substantial endeavour by the Scottish Office to
co-operate with Leverhulme in framing policies either to
change the trend of European markets or to make local
adaptations to combat downward trends. The Fishery
Reports certainly record the losses, year by year. As for
the Island fishermen, they shared the feeling expressed
by other Scots fishermen, that the old markets across the
North Sea, eastward to what had been St. Petersburg,
could and should be reopened, not closed 'for party
reasons' by 'English politicians'. Although ostensibly
Leverhulme ignored it, he cannot really have been unaware
of the effect of the downward trend of the fisheries upon
his own prospects of success, and upon the hopes and
confidence of the fishermen. Having been so outspoken
upon the shortcomings of Government with regard to local

464 shopkeepers and so on. But none vies with weaving as a source of regular income.
[288] Without the weavers most of the others would find little demand for their wares or services.

Periodic work is taken locally, usually in default of regular employment, and often by older men who formerly worked away from home. This is usually casual labour and is particularly important - for lack of other opportunities - in South Uig. Whilst our survey was in progress a number of men from South Uig were thus engaged at the Gisla
464 hydro-electric scheme. In South Uig, also, weaving tends to be less regular than else-
288 where. For this some weavers blamed the Stornoway producers, who, it was claimed
184 are not inclined to send work as far out as this unless it cannot otherwise be done. There is some truth in this, particularly with respect to the 'small' (i.e. non-mill) producers, but our observations also showed that some men in South Uig regarded weaving as an 'extra' and were not prepared to do it when alternative employment, on the croft or for wages (as at Gisla), was offered. This may be a vicious spiral - the less weaving a man does the less good he becomes, he takes longer to complete a web and may suffer more deductions for faulty work. He becomes less inclined to weave and the producer becomes less inclined to send him work.

TABLE 56

Permanent Employment away from home (actual numbers)

166
46

	Men:			Women:

East Loch Roag	16	-	23	15	6	15	7
Carloway	22*	3	25	12	5	3	11

* including five working seasonally on whalers.

Those taking permanent employment away from home (table 56) tend to choose particular occupations. Amongst men, the Merchant Navy is most popular, especially from the Carloway and East Loch Roag districts; many of the others work at skilled or semi-skilled jobs, including the police forces; relatively few are un-skilled casual labourers. Amongst women, nursing is by far the most important occupation and is particularly popular amongst young women from South Uig and Bernera; most of ther others take 'domestic work' - in hotels and hospitals, rather than in private homes - and a few work in offices and shops. The category 'professions' in the table is almost synonymous with school-teaching.

Periodical, including seasonal, absence from home is less common than from some island districts; 14% of the 15-64 age-group is classified as "periodically away" (compare 27% from Park, 16% from Harris, 13% from Barra). Of these, half the men and a third of the women are students. Seasonal hotel work, for women, is the most important single category.

Population trends

162 The diagrams, figure 48, summarise much of this chapter. They have been constructed
126 so that the area of each horizontal bar is proportionate to the number of persons in the

264 The only occasions on which it is customary to feed
574 someone an entire meal is at a work party, such as peat-
576 cutting. On such occasions the preparation of meals is
[461] done in an atmosphere of competition and mutual scrutiny,
[476] and the meals are often elaborate. At other times, the
requirements of etiquette can be minimally fulfilled by
giving foods which are still relatively abundant, but
which were much more abundant when the land was cultivat
[262] and cows kept. Such foods are barley bread, oatcakes,
264 clotted sour milk, cream and fresh butter. These foods
571 are usually offered to visitors along with tea, and in t
574 past this custom served to minimize the economic dispari
between villagers, to spread scarce resources. A simila
[737] function was served by the practice of giving part of
[431] each catch of fish to old widows and other villagers in
need of aid. Even though food is more abundant and dive
today, the taking of tea, and especially food, during a
visit is still very important.

173 A 50-year-old man who "married into" a croft recall
[581] "I came from a family of ten children. Everyone had to
[428] leave, or marry a girl with a croft. Only the eldest so
could inherit the croft." There was little room for
423 romanticism in the fight for scarce land among the sons
581 of large crofter and non-crofter families. "The most

178 434 288 458 be high until 1948. The year 1947 was the peak year for the production of Harris Tweed, with over 5,000,000 yards (of which 3,765,000 yards were stamped, and some 1,500,000 unstamped). In 1948 the production of unstamped tweed had fallen to 500,000 yards but stamped tweed came to 4,380,000 yards.

(651) Then, in the year 1948 the imposition of a 66⅔ per cent purchase tax struck the industry a crippling blow. The rise in prices of wool increased difficulties, and by 1950 few orders were being booked and men were being paid off. A few small men who had relatively large stocks frozen by the purchase tax were able to sell them off, but this minor compensation for losses was short-lived. The outlook is disquieting.

(ii) *Agriculture, Peat-making and House-building*, 1938

434 241 (a) *Agriculture.*—The estimated agricultural output shows a total value of £189,100, and of this total the quantity fed to animals was valued at £103,000. This leaves £86,100 as the estimated value of crop produce consumed on the Island. Adding this figure to the gross livestock output we arrive at a total valuation of the agricultural production of Lewis of approximately £194,100. To arrive at the average output per croft there was deducted the farm production, estimated at $\frac{1}{10}$ of the total by calculation from known crop and stock returns. This gives a figure for crofts alone of £184,400. By dividing by 3750, we obtain an average value of the gross annual production by crofters as £49, or say £50. The inclusion of squatters' produce would add so slightly to the total figure as hardly to affect the average for rural households. Outlays being small, most of this net output may be regarded as 'net earnings'.

434 222 314 [372] (*b*) *Peat.*—To this sum must be added firing and some share in housing. The peat cut has been valued at £90,000, an average of £24 per croft; it demands much labour. As peat is freely cut by cottars and squatters, etc. (estimated at 1050 or so), the average value might be given as £19 per rural household. In Stornoway the chief fuel is coal.

(*c*) *House-building.*—From 1920 to 1940 the Department of

Since 1939,
166 54 people have emigrated whereas only 4 have immigrated. Most of the girls have to
462 leave home when they finish school as there is no employment locally. Many of them go into domestic service or nursing in Glasgow. Many of the younger men also spend time away from home, often in the Merchant Navy. Breasclete is also the temporary home of the families of lighthousemen on duty in the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides the main source of income. This is a rather irregular occupation owing to the uncertain demand for the tweed, and although the men are nominally self-employed they rely on the mills to supply them with work. The tweed is woven on treadle looms, which, with ancillary equipment such as bobbin winders, are all owned by the crofters.

[458] As 1959 was a good year for the tweed industry, there was an air of prosperity in the township, and with the aid of government housing grants many new bungalows were being erected. But should there be a slump, the crofts would be unable to support the population and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
133 a' Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs,
361 for westwards to the sea the terrain is too rocky and irregular for either settlement or cultivation, whilst to the east of Loch a' Bhaile the land slopes precipitously from 250 ft. to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle drift-covered slopes, generally of small extent.

Cultivation is very noticeably limited to three areas - along the west shore of Loch
137 a' Bhaile, along the north-east shore of Loch Shader, and in the valley of the small stream
[241] draining from the north into the head of Loch a' Bhaile. Most of the croft land is composed of rock outcrops, rarely exceeding 100 ft. in height, separated by damp depressions frequently filled by reeds and rushes; bracken was apparent only on three crofts. In particular, the area between the two lochs is badly in need of draining and is largely colonised by reeds and very coarse grasses, of no use whatsoever as pasture. One enterprising person suggested that the township should hire a ditching machine - this could certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
311 2 holiday bungalows, with the croft holdings aligned north-east/south-west between the two lochs and the sea, except for nos. 28 and 29. The 53 holdings are unofficially
427 amalgamated in various ways and so reduced to 35 operative agricultural units. The acreage of crofts varies from 2.2 to 20.75 acres - a considerable variation. Fencing of the crofts - except for 1A, B, and C, and 12A, B, and C which are held 'run-rig' - was carried out between 1945 and 1950, whilst in 1946 the common pasture of 2,700 acres was fenced into two parks - an inner and an outer one, the division coinciding with the Carloway to Breasclete road. An area stretching from crofts 18A to 21 has, however, been most haphazardly divided. The seaward halves of some five crofts were redivided amongst seventeen crofts in the southern half of the township to compensate them for lack of grazing area within their own croft boundaries. This division is said to date from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
[407] small mechanical cultivators. Ploughing by tractor and horse, as opposed to spade cultivation, depends either on the urgency of the operation, or on the accessibility of the plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

[TEXT CONTINUED ON PAGE 95]

ST KILDA

and to show their friends at home, that they had braved the 484
hazardous Atlantic seas to visit St Kilda on the very edge of the 36
world. The tourists were charitable, but this brought a psycho- 175*
logical evil in its wake. In 1886, Robert Connel wrote: 'One [155]
cannot be long on the island without discovering the great moral
injury that tourists and sentimentalists and yachtsmen, with
pocketsful of money, are working upon a kindly and simple
people.' It was estimated that the islanders collectively derived a [434]
profit of 5s from each of the 200 or more tourists who arrived
during the short summer.

The new influx of cash into a community which required 436
money as an exchange commodity because the original native 198
produce was becoming less saleable, hastened the decline of effort
to be self-supporting. The numbers of seabirds slaughtered [839]
steadily fell; paraffin oil replaced the traditional bird oil in St [854]
Kildan lamps. The need for daily work, to toil in fellowship with [461] •
others, was dissipated; the islanders could purchase most of the
food they required, provided communications with the mainland
were maintained. The population was in any case dwindling, as [161]
St Kildans became more aware of 'the other life' available on the
mainland of Britain.

Finally, on a misty summer's day in August 1930, at a cost to 166
the nation of little under £1,000, St Kilda was left to the care
and keeping of the changeless Atlantic. It is now preserved by the
National Trust for Scotland as a crumbling monument to a small
human tragedy of a kind that has been repeated, and will be re-
peated, in other small communities who cannot argue out the
case for their survival in terms of economic viability. The island [712]
is now occupied by military personnel in connection with the
Hebridean rocket range on South Uist.

St Kildans were described by Dean Monro, in 1549, as 'simple, 175*
poor folk, scarcee learned in any religion'. In 1698, Martin Martin 181
published *A Late Voyage to St Kilda*. He went there in the com-
pany of a minister who had been summoned to the island to de-
nounce a certain false prophet who had risen among the 180
inhabitants (pretending he was an emissary of St John the Bap-
tist). Martin found, as did later visitors, that the island economy [825]
and the quality of its life were closely dependent upon its birds,

233 away, and for a shorter period. The sheep wander over
311 the moors all the year round, though they hang about the
crofts when the winter is severe.

221 A comparison with mountainous Norway or the Alps
132 and their high summer pastures suggests itself; but in
171 Lewis altitude is almost negligible, and the shielings may
[133] lie only two to five hundred feet above that of the crofts
[311] beside the shore. The difference between winter and
summer is in any case less, snow being rare and the condi-
tions being such that even in summer the shieling pasture
remains poor. Hence it is that while modern Norse and
Alpine economy still maintain the summer pasture, the
shielings have died out in the Highlands and are slowly
decaying in Lewis. Seasonally, stock are transported over
longer distances, from Highland to Lowland pastures.

181 Reasons for the continuance of these and other crofting
[178] ways, or for their abandonment, are not of an economic
order alone: not only the remuneration received for labour,
• [461] but the feeling for the work counts enormously. Visiting
a couple of distant shielings in the summer of 1919, I
found that two lads newly home from the Navy had come
up from their village 'for a holiday', bringing rods for
trout-fishing and high spirits for play. By day they fished
or flirted. By night they slept in one of the two shielings,
while the two laughing lasses they had come to visit shared
the none too wide couch of the other shieling with the
two older women there. One of these was a matron with a
motherly twinkle in her eye, the other was a spinster in
whose eyes there shone a memorably vivid light; she was
the sister (as I found later) of a noted minister on the main-
land. The bare simplicity of shieling life is traditionally
softened by fellowship and a gaiety that is not beyond
[538] control. A Lowland poet once coined a famous phrase,

511 coat, was thought to be supernatural. The fishing, too, is
226 of good standard: a typical annual catch including 1700
511 salmon, 5000 sea-trout and 1800 brown trout; and it was
for this, as well as for the shootings, that the moors per-
taining to the different shooting or fishing lodges and hotels
137 were bought at Lord Leverhulme's sale. The absence of
233 foxes was important to sheep-rearing before the introduc-
tion of guns, and is still a favourable factor.

5. *Sea-fishing*

226 Fish have always contributed to the diet of the Islesfolk,
198 whether they fished from coracles or boats, or with 'lang
[262] wands' from the shore as they still do, and as they did in
the days of Dean Monro and, no doubt, right back to
[433] neolithic times. The relative importance of fishing and
[241] agriculture, however, has always varied according to place
and time.

182 Fishing in modern and historic, and also in prehistoric,
226 times—to judge from the kitchen middens of Uig—has
always flourished more where there were deep sea-lochs;
241 and settlement resulted, even though rocky hillsides made
[178] ploughing difficult or impossible. Conversely, agriculture
[172] has offered better opportunity on smooth coasts with a
variety of soils, though fishing was poorer there. Thus
the men of Stornoway Bay and Eye, of eastern lochs and
of the Harris bays, like those of Loch Roag on the west,
have long been partly fishermen. In the extreme north,
too, men of Ness—with the chance of choosing their fishing
grounds on the north, west or east of the island and with
their little rocky port giving shelter, of a sort, from south-
• [461] west gales—were good fishermen; they are good seamen
[829] still. "The fishing of the Barvas folk" is an old gibe,

182 meaning that the men of that village, and its immediate
226 neighbourhood, were the last to put to sea and the first to
241 return. The Barvas folk could retort that they would
[829] have been fools to do anything else on a straight exposed
• [461] coast; and that anyway their pony-drawn ploughs were
of more use than the foot ploughs of the rocky south.
A form of provender taken indirectly from the sea was the
sea-birds and eggs from the sea-cliffs and islets like Rona,
north-west of the Butt. This helped to support a few
families in St. Kilda and on the rocky Shiant Islands south-
east of Harris.

195 Fishing remained backward and primitive, however,
226 until the nineteenth century. After developing in a
promising way, it was checked before the First World
[178] War, and fell into decay during and after it. Decay has,
504 of course, been widespread. In 1935 the chief ports of
501 the East Coast, from Leith with Granton northward by
Fraserburgh to Wick—a round dozen—had still an average
of 250 to 300 vessels, 3000 in all. These were chiefly of
steam or motor auxiliary power and valued (with fishing
gear) at £2,750,000. Orkney and Zetland, too, had each
their 300 boats. The whole West Coast, however, from
Stornoway to Ballantrae, had only 2000 boats, valued at less
than one-tenth of the fleet of the East, and worth only a
fraction of this, to judge from prices in the open market.
Nearly 400 boats were still on the register for Lewis and
Harris (Stornoway district) and another 300 for the rest of
the Outer Isles. But fewer put to sea each year, even from
Stornoway itself.

182 A major drawback to herring fishing in the Stornoway
226 district is the uncertainty in the movements of the herring
shoals. On the Clyde, moreover, herring can be sent fresh
to the city but further north they must be cured. Whereas

182 on the East Coast and in Orkney and Zetland there are
226 comparatively well-marked seasons at which the herring
can be expected, Stornoway appears to lie marginally to
their main migrations. Thus the amount of the catch
varies and curers have been disinclined to set up large
curing stations such as those which deal with the enormous
influx at the height of the season on the East Coast. A
partial compensation is found in the continuance of herring
fishing in winter.

226 While fishing from rowing boats for saith, lythe and
[178] mackerel still supplies food for home in summer, fishing
with long lines in winter and spring brought cod and other
white fish, sun-dried and salted, which became an import-
ant export though declining sharply after 1900 and of no
importance since 1919. Lobster fishing is undertaken in
small boats with two or three men from many townships,
and two ponds have been reopened, one on Bernera, Lewis,
and the other at Stockinish in Harris to store the lobsters.
Conditions in 1935 and 1951–53 are compared in Appendix
I (iii) and II (iii).

6. *The Annual Rhythm of Life*

221 It is appropriate here to show how fishing and crofting
fitted together into the seasonal calendar a hundred years
ago, and shortly before and after the war of 1914–18.
[182] The Lewisman's year shows its relationship to the seasons,
[175] with their temperature, rainfall and wind (Fig. 9). A
century wrought changes: cod fishing declined as the
[178] herring fishing grew in importance; but the latter fell
[286] away again after the war. Partly as a result, weaving has
become important, the men fitting into the idle periods
between the brief peaks of spring and harvest work.

• 461 Men's work can be roughly estimated as either light,
462

[TEXT CONTINUED ON PAGE 72]

• 461 part-time or (to use a convenient phrase) 'overtime',
462 meaning by this a special effort such as cannot be maintained
for long. Women's work, on the other hand, has a con-
tinuous element of 'part-time' occupations, which can be
simplified to 'light' work, when a woman's services are
also needed at harvest or to carry in peats, and the like.

462 One vital point in the life of peasant women is too
often uncontrolled: maternity, with its crisis of childbirth.
000 Among wild creatures the young are normally born in
spring, when food is abundant and daylight long; but
among mankind there is no clear season for parenthood.
462 This has its compensations, for neighbour-wives can, and
do, help one another, turn about. It also has its draw-
backs where women have a large share in the seasonal
round; and a heavy period of work, such as creeling peat,
may strain a woman for life if it comes when she should
have light occupation. It may well be that old Gaelic
customs, from courtship through marriage, provided
protection.

462 The seasons being still the same, the earlier sequence of
221 traditional tasks is maintained through the year with certain
differences. The upper graph shows the men ploughing
175 or delving, as the land permitted, from February to a
full-time peak in March–April. From then, women
helped increasingly. By March, nets had to be got
ready and the boats put in order for the fishing season,
closing in September. In townships well situated for cod-
fisheries, fishing for sale must have been almost full-time
work for many crews, in the season; elsewhere it seems to
have been no more than light work for food alone. Ashore,
women baited the lines and dried the cod. In April–May
the women would see that their few ewes bore their lambs
and suckled them in safety; and in spring the cows would
[see p. 11-analysis]

621 embracing several hamlets. Yet the strength of com-
476 munity life sprang from co-operation in the farm-team and
632 in the boat's crew.

178 With the passing of the joint farm the greatest dis-
• 461 ciplinary factor for work in common passed away from
476 agriculture. The fact that fishing still remained as a social discipline, and actually developed in importance as the farm-team declined and was abolished, was to prove all the more significant to the vitality of social life until 1914 and even to the present.

(2) THE COMMUNITY ORGANISED: STEERSMAN AND CONSTABLE

621 As small groups of two to half a dozen men could manage their agricultural affairs informally, by common consent, no official was formally chosen to manage the affairs of the
622 fellow-workers on a farm. Where prompt decisions are needed, however, even a small group should be led: a boat's crew therefore choose their helmsman-skipper and obey him at sea. And where several farm-groups made up a township, more formal deliberations were required, and to carry out their decisions they chose a responsible man, the constable.

175 Of the crofters' manner of deciding communal affairs
621 in Uist, Carmichael wrote, in 1884, that these meetings
181 "were highly interesting, as showing the ability of the people, their logical and legal acumen, their readiness of resources and, I can happily add, their invariable courtesy
175 towards one another. There was one regular official known
622 as the constable on whom there lay the chief executive responsibility. When a crofter is elected constable of his
[782] town-land, he takes off his shoes and stockings and, taking

(A) SACRAMENTS AND RUNES OF LABOUR, IN FAMILY, TEAM AND TOWNSHIP

788 Labour given to the winning of food, shelter and
221 clothing was begun and blessed by poetic, rhythmic prayers or 'runes'. The words were usually reinforced by a symbolic gesture or simple rite. By help of the runes the people sought spiritual preparation for work, invoked aid and finally consecrated the thing made for use.

221 Wherever work was rhythmic it was carried on by
• 461 working songs. Songs of hunting or herding recalled the
[171] hill and pasture, or praised the landscape with an exuberant flow unequalled in any tongue we know but old Irish, with which Scots Gaelic is so closely linked, or Welsh, of which the nature classics are linked to the epics of the sixth and seventh century thought to be composed in Strathclyde.[1]

788 Yet it was not these but the rhythmic prayers or runes
461 which initiated labour, stage by stage. They are paralleled
[171] among many peoples, but those of the Gael possess rare fullness of meaning and beauty of imagery, words and form. When labour was ended, the food won or the clothing made was consecrated for the use of family and friends, of the poor and the stranger-guest.

788 In the struggle for food, the sowing and reaping of corn
241 ranked highest, followed by its parching and grinding (*Carmina*, Nos. 88-92). The preparation of seed for its sowing was accompanied by its consecration, *an coisreageadh sioil*. Similarly for reaping: "Laying his bonnet on the ground, the father of the family took up his sickle and,

[113] [1] Examples of these nature poems are given in scholarly prose translation by Kenneth H. Jackson (1937 and 1950). Songs with their melodies will be found in Arthur Geddes (Ed.), *The Songs of Craig and Ben*, vol. i, 1951.

788 CH. VII SPIRITUAL LIFE OF COMMUNITY
538 versions to suggest the significant poetic form of the original.

788 "The Clipping Blessing", being addressed to creatures,
236 is simple in thought and form, and its opening may be rendered:

O come back woolly, though now you're shorn,
By May, may each a lamb have borne,
May lovely Bride you endow,
And Mary fair sustain you now!

[825] It goes on to beg protection from wolf and bear, as well
[538] as fox, hoodie crow and eagle, and closes with the opening couplet.

236 From start to finish the work must be true. The wool
• 461 is from the sheep they reared—it is not got by 'thigging', as a landlord takes 'gifts' from poor tenants; the yarn is sound with no odds of thread from worn-out cloth; the web is their very own, not the clergyman's due (*Carmina*,
786 110, 113, 109). Only so can the goodwife's web be beauti-
788 ful, and blest. "Thrums nor odds of thread, my hand
[539] never kept nor shall keep. Every hue in the bow-of-the-
[593] shower has gone through my fingers beneath the cross." The weaver, with her household cares and her bairns about her, to be clear in mind must be calm in heart as, thread by
[196] thread, she prepares her warp. To start, she chooses Saint Columba's Day.

[539] Thursday of blessings
For warping and waulking,
Thrice fifty strands
To number . . .

Ward away the evil eye!
Or evil will, or aught awry,
Consecrate, O Lord on High,
My Loom . . .

771 "The Iona Community is a Brotherhood of men within
792 the Church of Scotland seeking to find the implications of
794 the Kingdom of God for modern society. During the summer months they worship, work and live together on
621 Iona, rebuilding the ruined Abbey on a co-operative basis. Half the Brotherhood are young clergy pledged to work for two years in the difficult places of the cities (after three months in Iona), emphasising the place of the Church in the New Community that is emerging in the world. The other half are skilled artisans who desire to express their labour as a ministry within the Priesthood of all Believers and create—in the building—a microcosmic witness of how labouring is transformed when seen as a Sacrament. The Brotherhood is based on Reformation principles.
[221] Several members of the Community are married. At present the artisans return to the ordinary labour market in the winter time."[1]

• [461] In the Iona Community, theology is linked to communal labour and the re-shaping of society; and its symbolic centre, Iona, is more than a literary name, or a historic ruin, to those who have set about rebuilding its cathedral tower, cloister and surrounding dwellings. Continuity is exemplified in its leader, the Rev. George F. Macleod, a descendant of Dr. Norman Macleod, the friend of McLeod Campbell. The significance of this Community to the theme of this chapter lies in the endeavour of its members to learn, by help of ancient native ways, new ways of Christian life in their own land. The attempt to link industrial Scotland, and lands beyond, to the Gaelic West, is a notable recognition of what Celtic Christianity, maintained and renewed by communal tradition, has yet to give the world.

[1] From the magazine of the Iona Community, *The Coracle*.

175 perhaps once in a generation, the neighbours were still the
476 best administrators for poor relief. On the whole, this
651 remained true to 1914.

As to financial assistance from the Government, the
175 evidence seems at first bewildering in its contradictions,
651 suggesting utter inconsistency on the part of the people.
476 Thus, the record of the Lewis-and-Harris fishermen, in repaying loans for the purchase of boats, was the most honourable in the North-west. In 1900, of the total capital on barely 100 loans made to them, 83 per cent had been repaid, whereas on 150 loans elsewhere less than 60 per cent had been repaid.

175 Yet as to the record of Lewismen with regard to assist-
653 ance for road-making, the Brand Report was significantly reticent. In 1891 a road was planned direct to Stornoway from Loch Roag on the west coast at Carloway. This short-cut of sixteen miles was to shorten the distance by seven miles and so facilitate the transit of fish landed at Carloway. Crofter labour was employed as a means of 'self-help'. The road was, mistakenly, printed as complete on 'base maps' and other recent 'quarter-inch' maps. By 1901, £15,500 had been spent, a sum which exceeded the estimated cost, but only eight miles of road had been completed and five miles partially made, while three miles were quite incomplete. The estimate having been exceeded and "financial difficulties having arisen"—the contractor had gone bankrupt and the engineer was dismissed—the work came to a standstill, £10,000 more having been estimated as necessary to complete the road.
[121] Of that sum £8000 was granted.[1] But the road was left
• [461] unfinished. These figures alone might not condemn

[1] J. P. Day (1918), p. 328. Day added that "the work should now, more than twenty years after its start, be approaching completion"!

175 the work done—or rather not done—by the local labourers;
653 for deep peat has misled road engineers elsewhere.
But impartial observers have left no doubt that the work
461 was shirked—partly from the labourers' lack of will,
181 in other words from laziness, and partly from the not unnatural desire that further grants might continue, offering easy money. Inspection revealed deliberate and combined concealment of bad work, road metal being thrown on to give a surface which had no foundation. The Carloway road, which was to help the Loch Roag fishermen by rapid transport of fresh catches, was never completed. The bad work of many contributed to the undoing of all.

175 . How are these two apparently contradictory responses
657 to help to be explained? The answer lies in the completely
653 different methods of expending the grants. A loan to fishermen for a boat was put into their own responsible
121 hands. The hope of profit in which each could share stimulated their enterprise; and where both the private honour of each member and the corporate honour of each crew was at stake, mutual obligation and team-spirit spurred them to work. But road-making—a work many had done for contractors elsewhere as navvies under de-
181 grading conditions—was different. A Gael responds when his imagination is fired, whether for selfish or unselfish ends; but he can also enjoy leisure as to the manner born! Not only was personal skill or effort in road-making of no advantage to an individual; there was little to call out either personal prowess or team-spirit in the work. Moreover, little effort appears to have been made by the administration to arouse ardour. The ultimate advantage of a good road to the people on the west of the Island, as a whole, was clear. Yet since bad work and delay led (at first) to further

159 stubborn and suspicious; he never believed it. He realised
423 that the backwardness of the Island arose from lack of opportunity, and that opportunity he would do his best
433 to provide. Wherever he went he found the same story —things half attempted, nothing done." Leverhulme, one felt in 1919, wanted to do all he could for the Islanders. A greater man would have wanted to work not only for, but with, the Islanders. Then, even if the fisheries had been ruined, as they were, by forces outside his control, he would have shared a moral victory, not shared and suffered economic loss, with moral defeat.

174 In the Isles for centuries before, a family and well-tried
183 friends were valued above all other things. What was more, this was still true in the lifetime both of the elder men and
[178] the women he found at home, and of the absent men, at war. The foundation for this friendly life was a plot of
159 land and work to do, a home and the leisure to enjoy it.
433 Leverhulme, too, valued these things in his own way. He cared for human homes and gardens, and had proved it at
• 461 Port Sunlight and elsewhere. A pioneer of industry and efficiency, he pled for 'a six-hour day' and leisure afterwards, and he had done much to realise the ideal in his own works. Moreover, he was not without respect for spiritual values, freedom, and a congregation's right to choose their pastor.[1] All these things should have helped to put him into sympathy with Island life, and up to a point they did so.

159 It is clear that Leverhulme had considered the possi-
433 bilities of improving the local fisheries, village by village; and an engineer had reported on possible harbour improve-
228 ments at Ness, Barvas, and elsewhere. But he came to the

[1] Leverhulme (1927), p. 211; and Leverhulme (1st Baron), *The Six-Hour Day and Other Industrial Questions*, 1919.

458 problem remains that Island seamen may thus continue
746 indefinitely to be crofters receiving partial relief, seamen only in name. Without doubt, part-time work on a croft is socially a lesser evil than prolonged unemployment in a slum or semi-slum. The crofter's family, too, is relatively better reared than that of many a poor seaman in Glasgow, Liverpool or Cardiff. Yet if this were all, it would be no adequate life for a man, while continuing to be an expense
• [461] to the State. The more satisfactory side of such relief is
[311] that the Islanders, when unemployed, turn to building new 'white houses', and either to making small improvements on their crofts, or as in Ness (a progressive village with a high proportion of seamen), to the reclamation of new holdings on 'skinned land'. In all such cases a means test provides against full payment to those who could do without.

458 To women normally employed in 'gutting', unem-
746 ployment relief is given only at such time as there is no work during the season when it might be expected, *i.e.*
462 from May or June to December. Gutters from the Island
[228] are busiest for the months from June to August on the West and East Coast of Scotland, and again for two months, from October to November, in East Anglia. The number of Lewis women normally employed was over 1500 in a typical season (1930), the earnings averaging £19 each for the summer fishing in Stornoway, and as much again for the gutting in East Anglia. But the demand fell, and by 1932, for instance, some 250 women were obtaining relief, through Stornoway, in early August, the number doubling during the slack months from mid-August.

181 The tragedy and the danger of any means test are that
458 in effect it asks, not "How prosperous can you become if given help?" but "How poor can you become to qualify
746

181 for help?" In one of the Outer Isles, I know of one or
458 two crofters holding fifteen acres of arable, with a share of a good outrun, who have let their stock dwindle and
746 deteriorate, and their crofts lie mostly fallow, though these could support a horse or two, several cows, and fifty sheep. After having found some casual labour, they discovered they could live mostly idle 'on the dole'. Self-respecting neighbours suffer: good families who prefer to be independent of 'Assistance' and to improve their croft
[476] and stock, and the outrun too. These find their stock deteriorating for lack of co-operation in breeding, fencing, and other communal duties, and see their crops invaded by weeds, blown from a lazy neighbour's plot. While an idle neighbour benefits by their industry, they themselves are losers.

In another island, a hard-working crofter lost a score of good lambs through 'worrying' by the dogs of an idle neighbour, whose own stock had dwindled to a trifle. He was finally awarded legal compensation; but he found it wiser not to exact it, for the unspoken threat of exaction
[476] gave him a hold upon the idle 'dole-drawer'. The worker
[626] could still insist that the idler pay his share of the cost of posts and wire for a fence on the outrun, or contribute the minimum hours of labour due for fencing and other
• [461] statutory tasks in the township. Men like that idler sap
181 the urge to work. They lower communal morality to a semblance of the social code once too commonly seen by Islanders in the domestic service of the upper and middle classes, a code by which chronic idleness was disguised as 'leisure' and conspicuous dependence upon the work of others was honoured as 'independent means'.[1]

[1] A summary of production, and figures of productive and non-productive income, are given in Appendix I.

368 ground. Some of these provide for a much larger area and indeed the policeman serves the whole of the parish of Uig. Three buses per day in each direction operating on a circular route provide transport to Stornoway.

UPPER CARLOWAY

427 The township comprises 51 registered crofts and 28 feus and allotments which are
133 situated on the drift covered slope which rises from the head of Loch Carloway. The crofts are each about half a mile in length and from 5 to 25 yards in width aligned up and downslope. The lowest portion of the croftland is just above sea level and the highest approaches 225 feet O.D. The key crofts are numbers 30 and 31 whose boundaries come to a point thus enabling the crofts to be accommodated on the arcuate hill face. In the east are the crofts of Park Carloway which were lotted at a later date than the main area of croftland (numbers 1 to 40).

Only two crofts are fragmented ('fixed runrig'); these occupy lowlying hummocky land near the river where fencing would be difficult. Elsewhere fencing has been almost completed between the roads, but above the upper road fencing is less common, usually only being undertaken by the more enterprising crofters with more promising land; the bare rock surface of crofts 9 and 10 precludes any such attempt there. Almost all the fencing has taken place since 1946.

427 The 51 crofts and 28 feus and allotments are operated in 56 working agricultural units.
311 The total land reputed arable 134.4 acres and the outrun 82.65 acres which gives a total of 217.05 acres of individually held ('croft') land. The method of working is controlled by the relationship of slope, soil and elevation. Three zones may be distinguished, namely

(1) Below the road;
   a) well drained and fairly accessible,
   b) poorly drained and often far from the croft house
(2) Between the roads: a main zone of cultivation
(3) Above the main road an upper zone
   a) with bare rock and thin soil
   b) drift covered - similar in character to (2), but more exposed

Crofts 1 - 32 occupy all three zones
" 33 - 40 and 46 occupy zones (2) and (3)
" 49 is in zone (2)
" 41 and 42 are in zone (1)a and are in 'fixed runrig'.

241 In nearly all parts of these zones it is possible to use a tractor and so the cultivation
[407] of oats and cutting of hay is accomplished. It is usual to work the potatoes by horse, but only one man preferred to do all his ploughing by horse. This widespread use of the tractor is in marked contrast to the townships southeast of the Loch where it is almost impossible to use the tractor in many places. The significance of this in the contrasts in methods and efficiency need hardly be emphasised.

● 461 Life in a crofting township is governed by a very distinctive pattern of working that is so strong that it even influences the operations of the mills in Stornoway, for each crofter, if he continues to work his croft fully, must take time off for the communal operations such as the shearing or dipping of the sheep and inevitably at certain times of the year he will be anxious to work the croft. The table attempts to set out the pattern of the agricultural year in this group of townships (Figure 40).

DUN CARLOWAY

361 Dun Carloway though clearly of a similar type to the other townships south of Loch
427 Carloway has certain features peculiar to itself. The croft land may be divided into two sections; crofts 18 to 23 occupy the deep trench which extends from the Dun Carloway school to Loch Carloway itself. These holdings are larger than the average discussed above and are divided in broad rectangular block. To the west there is a less deeply entrenched zone where the crofts are long and narrow lying up and down slope like those
241 of Borrowston. Short steep and narrow lazy beds characterise the cultivation which follows the pattern set in the other townships, although the areas, as has been noted above, are much larger in some cases; the largest have up to twenty acres. Despite this increased size no croft has more than two acres of oats. The low percentage of land under cultivation is only in part explained by the difficult nature of the ground and
● 461 the limited use which can be made of the tractor. Few crofters are willing to attempt
162 more cultivation (to provide extra feed for store cattle or some other form of stock
[288] enterprise) so long as the income from weaving is satisfactory. The concept of the croft as an ancilliary employment appears to have defeated its own object, for with the population at its present level, and with the income from weaving as it is, very few crofters are prepared to do more than provide milk for the family, (with the annual cow and calf subsidies, and the proceeds of the sale of the annual calf as by-products) and to derive what income Providence rather than goodmanagement may allow from the sheep.

427 The total area of individually held croftland is 194 acres which is worked in twenty
311 five agricultural units derived from twenty six crofts, nine feus, one 'free gift' holding and one squatter. The cultivation is accomplished by one horse and one tractor, each of which is owned within the township.

311 The total sourning is exceeded, the main reason for this being the gross overstocking of sheep; 187.4% of the soum. This overstocking cannot fail to have a harmful effect on the common pasture, promoting an increase in the bracken already visible on some of the croftland itself, under-nourishment and disease. The poor quality of the hill pasture is brought home by a comparison with the grazings of North Uist where the most striking feature of the landscape is its greenness after the heavier browns of Western Lewis. Regeneration by surface seeding would certainly be helpful here.

SUMMARY AND CONCLUSIONS

128 The tables given in appendices C and D form the basis for much of the comment in the
preceding pages. They must now be considered in the light of the general tendencies which they illustrate in the changing livestock economy units.

241 Appendix C (1) elucidates the working of the crofts. The picture is somewhat com-
311 plicated by the large number of non-crofting holdings in the area, of which 43 carry
231 stock (a quarter of these sublet croftland). The number of feus also tends to mask the
433 process of amalgamation of crofts to form larger working units; a process which has been taking place for some time. There are in this connection one or two cases of the
427 cross working of crofts between individuals in neighbouring townships. The figures for these units have been included with those of the township where the tenant is resident.

241 Oats are the most important arable crop. The acreages of sown grass for hay and pasture are much lower in comparison. Permanent grass, mostly old arable land, is to be found on 52% of the total area of land occupied as crofts and feus. A large proportion of this is on very thin soil where bare rock is exposed and on wet land, but even so it does show that much more of the land might be under cultivation or improved grass.
[145] The decrease in cultivation since the late nineteenth century is probably much less than that for the Valtos area of South Uig where about 70% of the inbye and outrun is under

Labour - who are the agriculturalists ?

● 461 When we recall (Table 12, page 28) that 16% of the crofter tenants are absentees,
162 that 34% are over 65 years of age (of whom 8% are women), and that a further 7% are women under the age of 65, it becomes clear that many of the tenants cannot reasonably be expected themselves to provide active labour for agricultural operations. An attempt has been made to analyse the agricultural labour force; this must be treated with some reserve because it was necessary to decide for every effective agricultural
463 unit, who was the principal croft worker. In some cases croft work is shared by a
162 younger and an older man, the former having a regular job (often weaving) but being available for the heavier work, whilst the older man keeps things going from day to day. Women, even the elderly, often provide an important subsidiary source of labour, too.
128 Where two persons were shown on the croft record as sharing the work of the croft, the
[287] older, if over 65, was ignored. Thus the analysis probably under-estimates the part played by elderly persons. Nevertheless the results are useful (Table 43): two-thirds of all effective agricultural units are worked by crofters having other

asceticism is fundamental to the peoples' lives. A brief discussion of the Sabbath will serve to conclude my discussi of religion and to indicate some additional difficulties wh the Sgiathanach faces in his attempt to preserve his culture

Sunday does not exist on Skye. There is the "Continen Sunday" and the Sabbath. On any other day of the week, the greeting is, "It's a fine day," or, more often, "It's a wet day." The Sabbath, however, is "no day to be speaking of days." Keeping the Sabbath is almost a fetish among the people. It is a readily observable test of an individual's religious capacity. All unnecessary work, all unnecessary words, and all unnecessary thought is taboo. Only the barest minimum of worldly activities are permissible. This does not mean a day spent in idleness; the time should be spent in public worship at the kirk, private spiritual contemplation and family worship. The Skyeman's estimation of a newcomer may depend on his keeping the Sabbath. One man was very surprised to learn how long a memory the people hav when a man deviates from the expected. A visitor asked a crofter what kind of a man a certain newcomer to Kilmuir was, to which the crofter replied, "He's all right, except six years ago he played the pipes on the Sabbath." Most newcomers, including the few Catholics, respect the Sabbath.

No crofter would ever think of doing any work on this day beyond feeding his cattle as an act of mercy. After weeks of rain, the crop of oats or hay may be ready for harvesting on the Sabbath, but he will not touch it. A man

Despite these aids and incentives, parents do not encourage their children to weave. The weavers themselves describe the job as dull, offering no security and no possibilities for advancement.

Referring to her young son, a mother says, "By the time he's old enough to weave, the tweeds will have failed." Another mother says, "I want him to learn some trade, if he's intelligent enough. I don't want him to stay here. The tweed is so uncertain." "There's no future in it," says the father of another young boy, "I definitely wouldn't want him to be a weaver. It would be good if he went in for engineering."

The histories of the weavers reveal many examples of shifting occupations. Weaving often alternates with work in the local mill, which is also relatively unspecialized. The Shawbost mill must tolerate this unstable labor force, as labor is difficult to find. Eldest sons tend to leave the island for more stable, permanent jobs, leaving the croft and the loom to their younger siblings. Table V[1] shows the number of male weavers in each age group.

The fact that Shawbost has the same age structure as the rest of rural Lewis (see Table II)[2] and less unemployment signifies that weaving has not served as an adequate incentive to keep young people on the island.

585 For some weeks after returning, the couple goes visiti
178 with a bottle. The scope of visits seems to have narr
to close relatives unable to attend the wedding, and
sometimes the custom is referred to as old-fashioned.
[431] The bride usually mails pieces of bridal cake to
[205] relatives who were unable to attend the wedding.

758 2. Death: At a time of illness or injury, an
574 individual may see persons he has not seen for years.
The house is filled with a constant flow of visitors,
and the visitors recount every detail of a sick person
[763] pallor and movement. The room is usually occupied by
visitors when a person breathes his last.

763 In the past, work ceased in every house in the
46 surrounding neighborhood when a person died. This no
[178] longer occurs. (The story is told of a weaver who call
[288] a mill in Stornoway to say that he could not finish an
urgent tweed because there had been a death in the
village, and was told, "You keep on weaving till the
[535] weaver dies.") However, dances in the village are
[444] cancelled, and the bothan (an isolated hut in which
liquor is sold illegally) may close. Outdoor work, suc
as peat-cutting, which would be widely seen is avoided.

763 Word of the death spreads throughout the village a
[203] beyond within a few hours. From an immense, accumulate
inventory, memories of the deceased are brought out,

part-time or (to use a convenient phrase) 'overtime', meaning by this a special effort such as cannot be maintained for long. Women's work, on the other hand, has a continuous element of 'part-time' occupations, which can be simplified to 'light' work, when a woman's services are also needed at harvest or to carry in peats, and the like.

One vital point in the life of peasant women is too often uncontrolled: maternity, with its crisis of childbirth. Among wild creatures the young are normally born in spring, when food is abundant and daylight long; but among mankind there is no clear season for parenthood. This has its compensations, for neighbour-wives can, and do, help one another, turn about. It also has its drawbacks where women have a large share in the seasonal round; and a heavy period of work, such as creeling peat, may strain a woman for life if it comes when she should have light occupation. It may well be that old Gaelic customs, from courtship through marriage, provided protection.

The seasons being still the same, the earlier sequence of traditional tasks is maintained through the year with certain differences. The upper graph shows the men ploughing or delving, as the land permitted, from February to a full-time peak in March–April. From then, women helped increasingly. By March, nets had to be got ready and the boats put in order for the fishing season, closing in September. In townships well situated for cod-fisheries, fishing for sale must have been almost full-time work for many crews, in the season; elsewhere it seems to have been no more than light work for food alone. Ashore, women baited the lines and dried the cod. In April–May the women would see that their few ewes bore their lambs and suckled them in safety; and in spring the cows would

[see p. 91-analyst]

calve. For peat-cutting, the men took advantage of the driest months, with a peak in May–June; and after the peat stacked on the moor had dried through the midsummer months, the women set out to creel it in, before the autumn rain should have made the bogs too soft, and stacked it near their doors. The fishing season usually closed with some herring fishing in August–September. The clipping, or rather pulling off, of the wool as it began to be shed, was done chiefly by men, in July–August. Then, too, the absence of fences made herding doubly necessary to protect the growing crops.

Some relief was given by the departure of many of the cattle to the shielings, where a few girls and women would stay through July and August, once men and women together had driven the cattle there. Cows kept at home were, and still are, tethered, or herded close at hand. Even now the hay harvest is insignificant, and until this century it hardly existed, except for a little put by in a tiny barn. Towards the end of the summer, roofs were stripped of their thin thatch, and fresh turf was laid on the light rafters and covered with barley straw. Then as now, harvest came in September–October, all helping in reaping the oats with the scythe or the sickle, and pulling up the barley by the root. With the onset of winter winds, rain and cold, the chief outdoor tasks of the year were over.

Throughout the year there were small jobs to be done, and in the past, owing to the imperfection of implements, constant small repairs were necessary. Indoors in winter the women prepared the wool together and wove it. Baskets were also made then, the coarser types by men. By all these means the essentials of subsistence were largely met, so long as the seasons were reasonably good. Except for salt for the housewife and iron for the smith, the food

and clothing, firing and shelter produced met local needs. Further questions of early economy belong to Part Two, as do those of the festivals by which the seasons were initiated and closed, along with the phases of human life.

A century later (as indicated in the lower graph), agricultural tasks were much the same, but the character of fishing had altered greatly. Herring fishing was at its height in the Island for some fifteen years, or half a generation, before 1914; but it never recovered from the difficulties of the war and after-war periods. The curves of the summer, autumn and winter fishing indicate the 'full-time' activity of summer, and the 'part-time' work of early winter. Not only the men, but the women participated, the women being employed in gutting and kippering. Boats and men fished further afield. Women were employed in gutting in early summer in the Scots East Coast fishing, which preceded that of the West Coast and was followed by the East Anglian autumn fishing. Some line-fishing continued locally in summer, but it has now almost ceased. The building and repair of roads increased after the middle of the century. The carting of peats, stacked by the roadsides, lessened 'creeling'; but it is particularly haulage by lorry which has replaced carrying by the creel, so lightening women's labour.

Indoors, primitive crafts tended to be superseded as machine-made articles replaced those of native material and manufacture; but the *ceilidh* ('*cailey*'), the meeting 'together', continued, though the arts of song and poetic improvisation declined. In Harris the women had woven and spun for centuries and have continued to do so for home use and sale; in Lewis the women gave up weaving in the last century, few spinning since then and none weaving. Thirty years ago only an occasional weaver, always a man, could be

found in a Lewis village; but in the ten to twenty years before 1939, the so-called 'Harris' tweed industry spread enormously in Lewis, accompanied by the construction of large spinning mills in Stornoway which supply yarn to male weavers. One further activity, kelp-making, was important for a time, although—not being strictly a traditional task—it is not represented in the upper graph, nor yet in the lower one, having declined after 1825 and disappeared (in the Island) long before the present century. Such was the annual rhythm of seasonal labour prevalent during the last generation, and a hundred years before.

7. *Rural Changes in Diet, Dress and Inter-marriage, and in Mobility: 1919–39*

Many outward changes occurred in the twenty years after the close of the First World War. Till the Island was able to benefit from the commercial advances of the mainland, it had no adequate relief from the famines of early times; in recent years the quantity of food has been rather more adequate. With the import of new foods, the consumption of vitamins at first declined: there was greater consumption of white bread from Glasgow and less of fresh vegetables (as ruined garden walls bear witness), and less, too, of cod-liver oil with the cessation of cod-fishing. Latterly, fenced gardens with vegetables and lettuce are providing vitamins, and fresh fruit (unobtainable even after 1919) is commonly on sale all the year round, so that a more rational dieting, when it can be afforded, is tending to recover lost ground and perhaps more.[1]

[1] E. P. Cathcart (*et al.*), *Studies in Nutrition: an Enquiry into the Diet of Families in the Highlands and Isles: III, Lewis* (Medical Research Council, Special Reports, Series 242. H.M.S.O.), London, 1940.

to neglect crofting and to concentrate on weaving. Those who still participate in crofting activities may neglect their communal obligations, such as going out on the moor after sheep, and may prefer to harvest crops, cut peat or perform other agricultural activities independent of other villagers.

Despite these tendencies, certain criteria of firm boundedness are still found in the township network. All the adult males of the township, including non-crofters, are responsible for serving as officers in the township grazing committee. The committee draws up rules for the organization of communal crofting activities, and applies for grants from the Crofters Commission or Department of Agriculture, for example, to build a new township fence, plant trees as shelter belts for livestock, extend a peat road, or to fence and reseed areas of moorland in "township reseeding schemes" (see Chapter 2). All adult males of the township are expected to provide labor to implement such plans.

Township meetings, chaired by the clerk of the grazing committee, are held twice a year. A vote is taken when any decision is to be made. The vote is usually unanimous, as all discussion, argument and persuasion have occurred before the meeting, and those who disagree

and its neighbourhood becoming the centre of the growing industry. In 1793, the Lewis Parish contributors to the *Old Statistical Account of Scotland* indicated that upwards of 183 boats were fishing off the island. In Uig no less than 275 netmakers were recorded, showing that the fishing industry was prosecuted with some measure of enthusiasm. 'All the people dwell in little farm-villages and they fish in the summer season. The women do not fish; but almost at all times when there is occasion to go to sea, they never decline that service, and row powerfully.' In the parish of Barvas in the eighteenth century some 9,000 Scotch pints of oil were taken each year from dog-fish livers and sold to Stornoway merchants at from 6d to 8d per pint; it is related that the tenants of Ness were able for a long time to pay their rents with the oil proceeds. Cod and ling were the principal fish caught by the men of Lochs, an annual average of 24 tons being cured and sold in Stornoway. Generally, other fish caught were consumed locally.

Loch Roag on the west of Lewis proved to be about the best fishing ground; in 1794 about '90 sail' from all parts of the United Kingdom were at the herring fishing there. At one time Loch Roag-cured herring was exported exclusively to Sweden. The minister of Stornoway, contributing to the *Old Statistical Account*, gives figures showing the quantities of fish shipped from the port from 1791 to 1796. During these six years some 14,000 barrels of herring were exported to the Continent, and 20,000 sent for consumption in Britain; some 350 tons of cod and ling were destined for Continental markets. Herring, cod, and ling were thus pursued during the following years with growing vigour, though the inshore white fish took favour. The herring fishing did not make great strides, mainly because to the middle of the nineteenth century catches were confined to the inland sea lochs; the people for the most part were not familiar with deep-sea fishing, and their boats and nets were not suitable for it.

Indeed, when Sir James Matheson bought Lewis in 1844, he gave scant attention to the potential in the fishings round his island. Though he expended considerable amounts in securing a regular steamer communication between the mainland and the island, and spent over £2,000 in building a quay at Stornoway

6 TRADE AND INDUSTRY

In the earliest times, the folk of the island of Harris and Lewis were self-supporting; all that they needed for life as it was lived in those days was available at near hand; their existence was self-contained, the economy virtually self-sufficient. By and large, the only commodities often imported were salt, iron, and, to a certain extent, wood. Rents were paid largely in kind: the produce of agriculture, fishing and labour. Surplus produce was directed to southern markets to bring in the odd shilling or two for which there was really very little need in the island. But once money became important in the national economy, it was not long before it was required in the island economy too. By 1790, if not well before, two or three open boats set out each year from Uig to Glasgow, laden with salt beef and dried salt fish. At about this time, too, changes were making their slow appearance in the island way of life and living. Specialists were being required: smiths, tinkers, shipwrights, netmakers, boatbuilders, weavers, tailors and millers. Each of these craftsmen generally held some cornland, either individually or in shares, and also had some rights in the common ground of the township in which he lived.

CROFTER INDUSTRIES

From the pure crofter class there emerged the crofter-craftsmen. In Lochs, for instance, by the turn of the seventeenth century 80 per cent were registered as fishers and netmakers. In the west, in the parish of Barvas, some 70 per cent were also fishers, with kelp-making as a seasonal occupation. In Stornoway parish, where sub-tenants paid 30s to 60s in rent, with twelve days' service, they sold ling to their tacksmen at 5d each, earned 20s a month on herring boats, made kelp at 30s a ton, and worked on roads for 8d per day.

In Harris in 1895, the eight trained male weavers worked for the gentry only. Weaving for the populace was done by the

womenfolk, giving a ratio of only one male weaver to fifty-five families. In Lewis, male weavers were more common: one to every twenty-five families. The making of whisky was introduced about the seventeenth century. This was in addition to the old drink of home-brewed beer or ale *(lionn)*, and much of it was made to pay rents; it must have consumed a considerable quantity of valuable foodstuff. However, the spread of distillation as a legitimate home industry by which the rent could be paid, in kind or by sale, was followed by legislation prohibiting all but very large stills; illegal distilling of course went on in a small way.

It was, then, by a very narrow margin that subsistence was won in the island some two centuries ago. Many times famine showed how close was the wolf to the island doors. The introduction of the potato, and the interest in the fishing industry led to an increase in the population, though as discussed in Chapter 3 this in turn brought more problems. Basically, the island economy had never been organised on a sound foundation, with the result that winds of change blew where they would with little or no control.

A new factor in the island economy was introduced after 1750. This was kelp-making, the cutting and burning of seaweed on the shore for subsequent use in the manufacture of alkali for the glass and soap industries. The first tentative move in the island was made by MacLeod of Harris in 1748, when he allowed some Irish labourers to make kelp on his shores; so little was the product's value realised at the time that he only charged them 2s per ton manufactured. As the burning of kelp came to be understood, and the marketable value of the product ascertained, the native population set to. Between 1772 and 1864, about 50 tons were produced in Lewis each year, compared with some 800 tons per annum in the Uists; the Harris figure was 500-600 tons. The growth of the industry began to snowball, and the Minister of Lochs, writing in the *Old Statistical Account*, states that at the time (1796) some 50 tons were being produced in that parish per annum. In Stornoway parish, though no figure is available, the minister reports that kelp-burning was the principal manufacture, and that everyone able to fill a creel, or carry one, was employed at it for about three months of the year. Little of it seems to have been done in Barvas parish. The price of kelp varied

Thus were laid the lines of a new form of economic organisation for Lewis. At first, tweed manufacture here, as in Harris, was strictly a domestic activity: the wool of the crofter's own sheep was clipped, washed and dyed, carded, spun at home, and woven into cloth by persons in the township with the skill to produce a suitable cloth; the weaving was a part-time and mainly female occupation. Payment for the weaving was in kind: peats, potatoes, or labour. The waulking or finishing of the cloth was mostly a communal activity carried out by the womenfolk, who turned it into a particular social occasion with definite feminine characteristics. If the cloth made was in excess of domestic requirements, the crofter sold it directly to a customer, or else the local shopkeeper bought it or gave credit for it.

With the rise in weaving for a definite market in Lewis, all this changed. Weaving became a full-time specialist occupation and, partly because the flying shuttle made the work heavier, it became predominantly male work. With the use of mill-spun yarn there grew up a number of merchants, the Lewis 'producers', who bought yarn either locally or from the mainland, and put it out for weaving and hand finishing on a commission basis. The yarn and the resulting cloth remained their property. At times the cloth embodied a handspun weft; at other times perhaps no handspun was used at all. As pointed out above, it was marketed as Harris Tweed, as was the 100 per cent handspun cloth, yet it cost about 21d to produce compared with 36d for the 'real' tweed. The cheaper type provided Lewis's rapidly-expanding output between 1900 and 1911, and by that year Lewis had outstripped Harris. In 1912, the handspun yardage produced in Harris was 175,000; partially and wholly millspun accounted for some 4,000 yards; and the total value was £26,500. In Lewis the yardage of handspun cloth was some 10,000; but about 340,000 yards of partially or wholly millspun was sold. The total Lewis value was £44,000.

The trade mark

When eventually the question arose of some mark to distinguish between the two cloths, it was with difficulty that the Harris merchants persuaded the Board of Trade that a distinction was neces-

left the Island. Yet after 1931 many returned, owing to losses and unemployment both in British towns and overseas. When emigrants began to come home the 'Harris' tweed industry had spread to Lewis and offered increasing employment. Some men still fished in family-owned Island boats, and others as paid hands (on boats from the East Coast), though losses and unemployment were suffered.

Inter-war changes were hastened not only by movement beyond the Island—an influence at work for three or four generations before—but by mobility within it. In 1919 a small mail car made its way daily from Stornoway along each of the five main roads, with an occasional passenger. When crofters crossed the Island to Stornoway they went on foot or took the pony and cart at a slow walk: it was a day's journey. Ten years later, Ford vans, bought second-hand, ran daily to Stornoway from every township. Frequency, ease and relative cheapness of movement came late in an Island with no railway: the mobility of the motor for marketing and shopping brought rapid change.

'Hand-loom' weaving had become an important, if precarious, resource, important because of the capital invested and the labour employed, yet precarious because of its dependence upon name and sentiment, not only upon intrinsic value. In Harris many women had spun and woven for sale for over a generation before 1914, mostly weaving pure hand-spun yarn, and they continued to do so. For many years before 1914, an occasional weaver was to be found in villages in Lewis too, generally

problem remains that Island seamen may thus continue indefinitely to be crofters receiving partial relief, seamen only in name. Without doubt, part-time work on a croft is socially a lesser evil than prolonged unemployment in a slum or semi-slum. The crofter's family, too, is relatively better reared than that of many a poor seaman in Glasgow, Liverpool or Cardiff. Yet if this were all, it would be no adequate life for a man, while continuing to be an expense to the State. The more satisfactory side of such relief is that the Islanders, when unemployed, turn to building new 'white houses', and either to making small improvements on their crofts, or as in Ness (a progressive village with a high proportion of seamen), to the reclamation of new holdings on 'skinned land'. In all such cases a means test provides against full payment to those who could do without.

To women normally employed in 'gutting', unemployment relief is given only at such time as there is no work during the season when it might be expected, *i.e.* from May or June to December. Gutters from the Island are busiest for the months from June to August on the West and East Coast of Scotland, and again for two months, from October to November, in East Anglia. The number of Lewis women normally employed was over 1500 in a typical season (1930), the earnings averaging £19 each for the summer fishing in Stornoway, and as much again for the gutting in East Anglia. But the demand fell, and by 1932, for instance, some 250 women were obtaining relief,

so creating a small leak in the purse and in the mind, leaving both a little emptier, week by week. Surveys made by teacher-members of the Educational Institute of Scotland describe the effects on listeners in Highland parishes as pernicious, in the main. The reports of the B.B.C., on the other hand, emphasise their cultural endeavours, and the lightening of house-work and of rural monotony or solitude. Every effort is needed to aid a happy selection in home and neighbourhood.

Experiences undergone in war were of very differing types. Many men spent the war years in the Navy, without contact with decent town life, or others in the Merchant Marine. Of combatants in the land forces, the Territorials of the original 51st Highland Division experienced a few months of relative inactivity in France, then of a brief but bitter campaign, followed by long years in prison camps, while other soldiers underwent prolonged training in Britain, followed by severe fighting for long periods, far afield. Lastly, a limited number of men served in engineering or other works of war-time industry, though labouring work, at high wages, kept many of the older men employed at home. Of the women called up for service, some were posted to the Forces, some to the Land Army, and some were sent to factories. The greater opportunities for women to earn a living wage away from the Island tend to equalise the ratio of the sexes.

An experience new to the Western Isles came with the establishment of Air Bases. Not only did their construction provide high wages for labouring for the older resident

For a year or two after the war many men and women returning from the Services, the sea or the factories found employment in the flourishing Harris Tweed industry. This included work in the spinning mills and hand-weaving at home—work in which the male weaver was helped by his family in jobs such as bobbin winding. Few fishermen dared to sink capital in new boats and gear, and risk losses such as those sustained after 1920. Few women wished to return to the hard, uncertain work of gutting. The whaling station, built on West Loch Tarbert before 1914 and open for a short time between the wars, was reopened in 1950, and employed some 30 men for 18 months before it closed in 1952. Crofting was lightened by some mechanised cultivation. The war-time construction of air-fields had ceased, though some harbour-work and road-making was assisted by government grants.

In 1949 the Harris Tweed industry, now the Islanders' main source for earning, was crippled by the imposition of a 66⅔ per cent purchase tax on hand-woven Harris Tweeds. Parliament decided that as a non-utility product, its export sales alone could be exempt from tax. Viewing the position of the tweed industry in Britain as a whole, there were strong arguments for the extension of the tax to Harris Tweeds: the high-grade industry of the Scottish Border or the manufactures of the West Riding should not be subjected to unfair handicap. At the same time the crippling of a handicraft practised by peasant or artist favours mass-production to the loss or ruin of traditional and experimental workmanship or design to which, in the

boats; value, £15,400. Of this, the greater part came into Lewis creeks (Table 17), making £10,000 for Lewis.

Finally, we may add a round figure for whole or part-time occupations associated with the fisheries, including what accrues by the visiting fleet and its business, of, say, £20,000. This gives a total net output approaching £85,000 from fisheries for a typical year just before 1939.

We now turn to an estimate of the earnings of fishermen and of the women engaged in curing. To some extent these figures overlap, for the value of the net output includes the wages of fishermen and women; but the sums earned on 'stranger' vessels—reduced now to some £3000—and the wages earned by women gutters and curers in East Anglia (about £10,000) are additions to Lewis income. Some of this was, no doubt, sent home in the form of postal orders, etc., causing a further overlap, but much of it was probably sent in the form of notes or brought home in cash. In order to show the real net earnings of rural Lewis, these are separated from the output shown in the first column ((A, i) on p. 314) and are tabled under "Earnings by Crofting and Associated Rural Occupations only" (A, ii).

(*b*) *Fishers' Earnings.*—As no figures of local earnings are separately published, estimates must be based upon the collation of the Fishery Board's *Annual Statistical Tables* and accompanying *Annual Reports* with careful local enquiries. By 1938 the fishermen on Stornoway District herring fishing vessels were reduced to about 350 men and boys in the summer season, of whom only a few worked in autumn and winter. Their earnings included the earnings of share owners of boats and of nets, and of those without shares, the latter being only a fraction, say a quarter, of the total. Nearly 100 District men still worked on 'stranger' (East Coast) vessels at the summer fishing and rather fewer at the East Anglia autumn

PRESENT INDUSTRY

of a knitting industry based on the crofters, who would use Lewis yarn and produce knitwear in addition to their woven fabrics. However, it was found that the yarns used for Harris Tweed were unsuitable for knitwear, not being given sufficient twist in the spinning: before women use this tweed yarn for knitting, it is common practice to twist two or more threads of yarn together on a hand spinning-wheel.

Little in the way of craft work is done on the island, mainly because of the lack of indigenous materials which could be used to produce typically-island items. Marram-grass has been suggested as being suitable for making agricultural wind-breaks, and close-woven basket-work. Shore-stones and pebbles are plentiful both in quantity and variety of type and colour.

Small employment outlets on the island are marine and motor engineering, mainly based on Stornoway, and boat-building. This latter is a small but socially-significant firm in Ness with products with a high reputation. Construction and general building is of some significance, one of the most enterprising firms being built up literally from scratch so as to become a highly-successful island business.

The unemployment problem

The island's unemployment problem is as much a matter of concern today as it has ever been, averaging about 25 per cent annually (representing well over 1,000 people) compared with the Scottish mainland figure of 6.0 per cent; the contemporary figure for Britain is around 3.0 per cent. While unemployment as it affects adults is serious enough, unemployment among teenagers threatens the community's whole future. The island has its Youth Employment Officer, who has an unenviable task. Each junior and secondary school in the island is visited to interview school-leavers, at least once a year; employment advice is given and this is supplemented by Careers Officers' visits.

Such employment openings as exist over the island's limited spectrum are concentrated in Stornoway. They are, however, mainly in shop work, mill work and hotel work for girls, with a few vacancies for apprentices in trades generally associated with building construction. Most of the jobs offered are very much in

TRADE AND INDUSTRY

the nature of stopgaps in the younger, formative years and do not offer progressive training for the eventual chosen career. As an example of this, a number of island girls come to Stornoway to work in local shops and then leave the island after two years or so to take up hotel work or nursing on the mainland; many boys leave the island for apprenticeship training in trades which now require evening-class, day- or block-release educational classes. About fifty young persons leave the island each year under the Training Allowances Scheme of the Youth Employment Service, which financially assists them to live in lodgings while working away from home.

Most of the employment categories in the island of course employ less than a handful of people, either full-time adults or time-serving apprentices; they are fully staffed very quickly and opportunities arise only when an employee dies or leaves the island, or—more rarely—when an increased demand for a service (for instance television engineering at one time) creates vacancies for apprentices.

COMMUNICATIONS

sold, one such causing legal history. The chief garage proprietor in the town applied to use for his business a site he had purchased at a road junction near the western end of the town, close to the principal new housing schemes and opposite the main gate leading into the Castle grounds. It was a mistake in planning, and public disapproval began to make itself felt. The Trust, in an effort to redress the situation, sought to distrain the garage proprietor from extended use of the area. The parties went to law, and the case was fought through the courts until, in the House of Lords, the Trust finally lost and had to pay a bill of some £4,000, equivalent to a fine of £4 to £5 from every family in the burgh. The Trust drew its lesson, and since has formulated a more alert and constructive policy.

The town is well served by its shopping centre, with multiple stores jostling for custom with smaller private business concerns. Prosperity for all, however, depends on the well-being of the Harris Tweed industry. If there are recessions, as there have been in the past, the tills rattle spasmodically. Also standing to suffer are others such as the bus companies (who provide the efficient town services and link up Stornoway with the rural areas), the builders and the haulage contractors. In the ever-present climate of unemployment it is the policy of the mills to employ male labour, despite the fact that women would be cheaper. The mills, run by natives or by Lewis-born incomers of the second and third generation, realise a social obligation in recognising that in Lewis the strong tradition is that the man should be the head of the family in every sense. The mills also carry a proportion of surplus labour to offset the unpredictability of those workers who, with crofts to look after, occasionally have to take a day off 'at the peats' or some such activity. This is another of the island's distinctive traditions.

On Cromwell Street is the shop of James MacKenzie & Sons Limited, dealing in hardware, furniture and china. Nothing unusual in that, at first sight: yet it is another unique aspect of life in Lewis, being conducted as a charity for the benefit of, among others, the aged and infirm persons of Stornoway. The business was established in 1830, on its present site. In 1964, the then principal shareholder presented the building and the business as a

THE OTHER ISLANDS

even to the extent that the St Kildans used their observations of the flights of birds both as compass and as omen for good or evil. Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naïvely at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, HMS *Flirt* sailed from Greenock with food to relieve hardship among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island consisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the Western Isles'. All were well furnished, peat was used for fuel and there were two watches and one clock on the island. There were some seventy-five islanders; most of the men were old, and only two of them were unmarried, with twelve spinsters still to choose from. All read the Gaelic Bible. The men were mostly tailors, shoemakers and weavers; every house had a loom. They made all their own clothing, the men also making the women's dresses, and a good deal of blanketing and tweed cloth was made and sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each croft and house was rented at £2 annually, sheep being charged for at the rate of 9d per head; these charges were usually paid in kind.

Feathers of the sea fowl formed the principal export of the island. The factor paid 6s per stone of 24 lb for black feathers; and 5s per stone for grey. For these he received, in Edinburgh or

CH. 1 ENVIRONMENT AND LANDSCAPE

From prehistory to the present day, these geographic zones have played their parts as factors in evolution, although the border-lines have changed at different historic crises, and have been modified by economic and social phase. At times the Hebrides have been more closely linked to Ulster or to Norway than to Central Scotland. In viewing these zones, we shall not find simultaneity in historic events, but comparability in stage and transition, even at differing periods. From the evolutionary point of view, the revealing character of Island life lies not only in static survivals, in what Sir Arthur Mitchell found in the Isles and vividly described as " the Past in the Present ". Island life is characterised still more by the dynamic strength of its continuity—notably of early or primitive Christianity—and also by the late occurrence of changes when, at last, they came.

The social consequences of these regional differences in evolution are profound. In the ' Plain ', to the south-east of the Severn-Tees line, large village communities with ' common fields ' prevailed, forming the later manor villages. To the north and west, the more varied, hillier lands encouraged the continuance of hamlets. These hamlets housed close-knit groups of families, often of no more than four or five to a dozen relations or ' friends '—in Scots even today (much as in Gaelic) the word ' friend ' frequently implies kinship. Each small group formed a team. Together the men ploughed their mingled rigs (or ridges) and herded their stock in common, and on the coast they rowed their boat as its crew. The women, too, did much together, as when they spun their yarn, and fulled or ' waulked ' the cloth that one of them had woven, helping by turn in childbirth and child-care. Usually several of these teams were linked in a larger

APPENDIX I

average wage for the summer season dropped to about £25.

The number of women engaged in gutting and packing (and kippering) herrings varies from year to year. In 1938 1000 were engaged locally in summer, most of whom also went to East Anglia. As always, the greater part of the wages was earned in the summer and the remainder in the East Anglia (autumn) fishing season. The net average earnings per worker of the Scottish gutters and packers were estimated at £16 at the Scottish summer fishings and £17 at the East Anglian fishing (*Annual Report*, p. 12). This figure included ' arles ' (*i.e.* earnest money), but excluded travelling expenses. The Stornoway District earnings averaged £16 at the local summer fishing but only £15 at the East Anglia fishing. The latter is a small return to place against the skill of the worker and the discomfort she endures. The women work in small teams together, and their efficiency is partly due to their comradeship.

Figures for catches have already been given as approaching £20,000 for herring and £10,000 for white fish and shell-fish. While the net earnings derived, after subtracting the working expenses of boats and outlays for gear, were very much less than this gross sum, a substantial part should be counted as equivalent to earnings (Statistical Table 21).

Summing up the total net earnings, we arrive at the following for Lewis proper. The women's total net earnings may be taken as £25,000. We add to the probable earnings of the men at the herring fishing an allowance for their profits from other catches, making a total of say £15,000.

The industry was still declining here as elsewhere in Scotland. About 1930 the earnings of hired hands alone reached £30,000 and that of women twice as much, say £60,000. Besides this was the important sum earned by men with share of boats. The local white fish and shell-fish catches were also considerably higher at that period. As to the future, much

175 464 166 462 [288] When the weaving started, some men settled at home permanently, but many continued to come and go between the sea and the loom. In 1931, the ratio of men to women in Lewis and Harris was 100:114. The men came home for temporary jobs, such as the construction of roads [522] or houses. Jokes are told of the common practice of [906] sending for an extension of leave. The men found it easy to join the Naval Reserve because of their fishing experience; and it brought them a retainer's fee and expense-paid trips to places off the island for several weeks of training during the year. But when the wars came, [901] the loss of men to the Navy and to the Merchant Service was heavy.

B. The Land

175 427 The number of arrears in rent in the Barvas rent ledger at the turn of the century indicates the small amount of money in circulation at the time. Between 1899 and 1914, several crofters paid part of their rent "by work," and six had some of their stock "uplifted by decree." For example, a Widow Catherine lost "one red

233 were taken out to small huts in the central moorlands 233 for several months during the summer. These moorland 342 dwellings, called sheilings or airidh, were tiny stone structures, as small as seven by five feet. They had double stone walls filled with clay, and a rounded thatched roof. There were two doors opposite each other in the longer walls, one of which was filled with turf depending on the direction of the wind. A fireplace [354] was built into one end of the hut; shelves in the stone [352] walls held basins of milk and other items; and the major part of the sheiling constituted a grass-and-heather-lined cavity which served as a bed. The sheilings were usually [361] clustered together near a stream, duplicating neighborhoods within the village.

221 Ploughing and planting were finished in the spring before the young men and women went off to the fishing, and before the cattle were taken to the sheiling. Some families went to the sheiling as early as March for a "fresh bite" of grass. Many went out in the middle of May, and returned at the end of July or beginning of August.

233 "During the week, young girls or boys stayed out on 857 the sheilings, depending on who was available in the 887 family; maybe old people who couldn't do anything else, 462

288 developed from the concentration of power in the hands
175 of the merchants. In the early days of the industry,
441 all the processes involved in the production of a
286 finished length of tweed were carried out by individual
236 families. A man used wool from his own flock, and with the
438 aid of other family members, dyed it with vegetable dyes,
175 [386] carded and spun it by hand, wove it, washed and shrunk
286 it, and found his own buyer. Dyeing wool, spinning yarn,
236 and washing ("waulking") the finished length of tweed
175 was usually done by women. In Harris, the entire process
462 of producing a tweed was carried out by women, but in
Lewis the weaving was done largely by men.

175 A woman in her 80's recalls the process of weaving
286 when she was young. Hand-spinning had died out by this
time, although the question of whether tweeds woven with
such yarn could legitimately be called Harris Tweed was
not resolved until 1934.

175 "About 1916 or so it took about two weeks to a month
283 to do a tweed. You bought the wool from the Agricultural
[435] Board. Sixteen bags of wool, costing about L20, would
[433] do four tweeds. You needed four one-stone bags per
[386] tweed. Then you would spend a day gathering a bag of
[824] crotal (lichen scraped from rocks and used for dye). One
bag per one bag of wool was required for the dye. After

175 dyeing the wool it was spread out, dried and sent to
283 Stornoway to be made into yarn. The yarn was then sent
175 back, and the weaver wove and washed it. About six women
286 [462] were required to do the waulking (the process by which
the cloth was washed and shrunk).

175 "In those days the weavers designed their own
286 patterns, and sold their own finished tweeds. I remember
432 going into town with my brother, we had two tweeds in the
cart. We went into a shop to sell the tweed, and the man
said it was poor weaving. He didn't want to pay the full
price for it. I told my brother to roll it back up, we
would take it somewhere else. As we left the shop, he
told me I had 'good cheek.' In the next shop the merchant
didn't say anything, and gave my brother the regular
price. We went home with L60."

286 The great demand for tweed encouraged the development
288 of more efficient methods of production. One by one the
175 various processes of production were taken over by
178 specialists, and gradually these specialists were brought
[433] together under one roof. Large boilers for dyeing wool
[434] were supplied as a result of actions taken by the Congested
[463] Districts Board, which was formed in 1897. The Scottish
[386] Home Industries provided chemical dyes. The most
difficult and time-consuming processes were carding and
[236] spinning, which small mills on the mainland began to do
[283]

APPENDIX I

228 434 boats; value, £15,400. Of this, the greater part came into Lewis creeks (Table 17), making £10,000 for Lewis.

Finally, we may add a round figure for whole or part-time occupations associated with the fisheries, including what accrues by the visiting fleet and its business, of, say, £20,000. This gives a total net output approaching £85,000 from fisheries for a typical year just before 1939.

[462] We now turn to an estimate of the earnings of fishermen and of the women engaged in curing. To some extent these figures overlap, for the value of the net output includes the wages of fishermen and women; but the sums earned on 'stranger' vessels—reduced now to some £3000—and the wages earned by women gutters and curers in East Anglia [434] (about £10,000) are additions to Lewis income. Some of this was, no doubt, sent home in the form of postal orders, etc., causing a further overlap, but much of it was probably sent in the form of notes or brought home in cash. In order to show the real net earnings of rural Lewis, these are separated from the output shown in the first column ((A, i) on p. 314) and are tabled under "Earnings by Crofting and Associated Rural Occupations only" (A, ii).

[127] (*b*) *Fishers' Earnings.*—As no figures of local earnings are separately published, estimates must be based upon the collation of the Fishery Board's *Annual Statistical Tables* and [178] accompanying *Annual Reports* with careful local enquiries. By 1938 the fishermen on Stornoway District herring fishing vessels were reduced to about 350 men and boys in the summer season, of whom only a few worked in autumn and winter. Their earnings included the earnings of share owners of boats and of nets, and of those without shares, the latter being only a fraction, say a quarter, of the total. Nearly 100 District men still worked on 'stranger' (East Coast) vessels at the summer fishing and rather fewer at the East Anglia autumn fishing. The sum so earned may have been a third or more of the earnings on District vessels. Altogether the total net earnings from herring fisheries received by all fishermen from Lewis proper came to little more than £8000. By 1938 the

APPENDIX I

228 434 average wage for the summer season dropped to about £25.

The number of women engaged in gutting and packing (and kippering) herrings varies from year to year. In 1938 1000 228 were engaged locally in summer, most of whom also went to 434 East Anglia. As always, the greater part of the wages was earned in the summer and the remainder in the East Anglia [462] (autumn) fishing season. The net average earnings per worker of the Scottish gutters and packers were estimated at £16 at the Scottish summer fishings and £17 at the East Anglian fishing (*Annual Report*, p. 12). This figure included 'arles' (*i.e.* earnest money), but excluded travelling expenses. The Stornoway District earnings averaged £16 at the local summer fishing but only £15 at the East Anglia fishing. The latter is a small return to place against the skill of the worker and the discomfort she endures. The women work in small teams together, and their efficiency is partly due to their comradeship.

228 Figures for catches have already been given as approaching 434 £20,000 for herring and £10,000 for white fish and shell-fish. While the net earnings derived, after subtracting the working expenses of boats and outlays for gear, were very much less than this gross sum, a substantial part should be counted as equivalent to earnings (Statistical Table 21).

Summing up the total net earnings, we arrive at the following for Lewis proper. The women's total net earnings may be [462] taken as £25,000. We add to the probable earnings of the men at the herring fishing an allowance for their profits from other catches, making a total of say £15,000.

178 The industry was still declining here as elsewhere in 228 Scotland. About 1930 the earnings of hired hands alone 434 reached £30,000 and that of women twice as much, say £60,000. Besides this was the important sum earned by men with share of boats. The local white fish and shell-fish catches were also [656] considerably higher at that period. As to the future, much will depend on what can be done to rehabilitate the local industry by compensation for losses incurred in war, and by assurance that government policy will encourage local fishermen to embark on their enterprise without the risk of the

000 The reduction of the present number of agricultural units then becomes desirable. There are two ways in which this could come about; firstly by continued depopulation, but amalgamations consequent on such an uncontrolled run-down of the community would lead to scattered holdings; such is the experience of other depopulated crofting districts. The second point to be made is that if overall planning were possible, it would be desirable for holdings to be amalgamated as they become vacant as a satisfactory rearrangement of the townships would then follow.

Concurrent with such a policy would be the aim to create distinct crofting and non-crofting groups. Employment for the non-crofting section of the community, be it fishing or weaving, would first have to be assured. As has already been stated, fishing would appear to offer the best prospects, while tourism could play a minor role in providing an opportunity for the enterprising crofters' wife or non-crofting household. One problem above all remains, the maintenance of an overall viable population. A certain minimum level of population is essential to maintain the operation of local transport, post office, educational and medical services. Such considerations suggest that further research is necessary to assess the optimum number and structure of population which a district such as Park could reasonably support. In the same way, a detailed examination by an agricultural expert is desirable, in order to assess the number of economic holdings which could be supported on the land of each township.

In conclusion, it is clear that, short of unexpected industrial employment becoming available in Park and unless major reorganisation of the present agricultural units and communities is carried out, the present population trends must continue. However, if such radical changes cannot be contemplated, then considerable improvements in the standard of husbandry, the re-seeding of croft out-runs and common pastures, and the fencing and general improvements of the crofts are possible and will increase agricultural productivity. Until there are some radical changes, the present pattern of the most enterprising members of the community engaging in ancillary employment which takes them furth of the district, and the serious degree of permanent migration to Stornoway and the Scottish Lowlands, will be maintained and increased.

APPENDIX A

PARK IN COMPARISON WITH OTHER CROFTING DISTRICTS.

462 464 241 Table XVIII gives an analysis of the occupational structure of the male population of insurable age in four crofting districts studied by the Crofting Survey. In all four areas, a considerable proportion of the insurable population is not resident in the crofting area for more than an annual holiday period. This proportion varies in relation to two main factors - the viability of the crofts and the availability of ancillary employment within the district. South Uist and Benbecula stand out as the districts where such permanent absences are least marked: the crofts in these islands are larger and more employment is available. In Barra, there are few large agricultural units and, as in Park, the decline of the fishing industry has led to economic disaster in many townships. Fewer than half of the men in this age group are fully resident in Barra. Park is in many respects comparable to Waternish (Skye) for both districts are isolated and have experienced serious depopulation. (see Table XIX).

It is a significant fact that in none of these districts are more than 20 per cent of the male population solely engaged in full-time croft work, and this is a measure of the inability of the crofts to support a family without ancillary earnings. The amount of permanent employment available varies from district to district; in South Uist and Barra there are minor service centres which are urban in character and 23.2 per cent and 13.6 per cent of the respective insurable males are engaged in non-crofting employment on these islands.

[166] [167] It is clear that the occupational structure of these four crofting areas is far from stable for over one-third of the potential labour force is away for all or part of the year. It is also clear that basically the absence of sufficient natural resources, coupled with the varying degrees of isolation from the industrial centres of Scotland, are the root causes of the present position.

TABLE XX

| | MALES | | |

APPENDIX B (i) Population totals.

| | MALES | | |

121 by help of oral tradition and of the living witness of con-
174 tinuing usage, we can reconstitute Gaelic life from the
176 view-points of both people and chief. Elsewhere, even in
Scotland, only fragments of early life are recorded, in
175 parchments written by the lawyers of landlord and king,
and almost always from the privileged side. History is
[184] indebted to modern lawyers who have deciphered and
127 published the faded documents of their predecessors. But
the very training as solicitor-factors which fitted them for
this specialised task, in no way prepared them to view life
as seen, experienced and felt by the men and women of the
past, or even by the elders or youth of the townships today,
with whom they have rarely laboured and whose mother
tongue they rarely understand.

(a) THE LABOURS OF MAN AND WIFE, AND THE REWARD

62 We have seen that until the nineteenth century the
632 township in the main was self-contained. Its people grew,
175 made or caught their food, and also found the raw materials
[33] for their clothing; they built their own shelter, and cut
74 their own firing. As a result, both men and women had
each to develop "a wide range of simple skills", in the
175 apt phrase of a Lewisman, Mr. Donald MacLean, M.A.
462 Beyond the co-operative effort within a family, a farm
group, or a bloc of 'fellow-townsmen'—in which each
was competent to take a share according to sex and age—
[463] aptitude and family tradition initiated some local division
of labour. The resident smith and the 'caird' (*cèaird*,
a wandering craftsman or tinker) appear in the oldest tales
and in the first rent-rolls. In addition there were honorary
[759] tasks. The smith might act as the village surgeon, ready

174 to bleed or to set bones, while some elderly woman would
175 serve as physician and midwife. Spiritual consolation
and renewal too could be found, even in the absence of
462 monk or nun, or of priest, minister or catechist. Enough
[463] here, that with agriculture and fishing, most crafts, except
[159] metal-work, were practised in every family. The 'range
[793] of skills' was therefore wider and richer in latent art than
[593] might be supposed from those needed on a little croft today.
Hence the importance of understanding the roles of hus-
bandman and housewife, of "the man and the woman of
the house".

174 Their labours through the annual rhythm of the seasons
462 might be classed as efforts for the man and endurance for
221 the women (Fig. 9). Man's muscular strength and free-
[181] dom of limb rouse him to efforts demanded by the thrust
and lift of peat-cutting, digging in stony soil, or pushing
the foot-plough, step by step obliquely down a rocky slope.
In the past an archer's chase of stag, wolf or boar demanded
all a man's effort, and courage too, as fishing still does in
the stormy north-western seas. With this facing of danger
there came a gaiety that sparkled like the crest of a breaking
wave. Women's work demanded by its unceasing activity
a cheerful endurance, whether at labour on the croft, at
corn-grinding, butter-making and peat-carrying, or card-
ing, spinning and weaving; and with every task of day or
season came the constant tending of cattle, of menfolk and
children.

[538] This allotment of seasonal tasks and skills is neatly put
in the proverb, "A man's cow won't yield milk, nor a
woman's horse ploughing" (*Cha bhi baimn' aig ho fir, 's
cha bhi treabhadh 'an each mnatha*). Yet women have
always taken a share of work on the croft—too heavy a
share when the men were much away—and the habit of

174 encouraging them to rest when the men returned was
462 fondly indulged. Much can be learned from the first (or
221 'old') "Statistical Accounts of the parishes of Scotland
175 drawn up from the communications of the Ministers of
462 the different parishes", *circa* 1790–96. Of the parish of
[463] Stornoway, where by 1790 many men had become crofter-
127 fishers and others were at sea, the Minister wrote, "The
women labour at least as hard as the men-", even pulverising
the ground with heavy hand-rakes (harrows being seldom
used), and digging both with crooked and straight spades.
That the men's debt was repaid in acts of manly service
is true. A man would carry wife or sweetheart on his
shoulders across a river in spate, whose rushing waters
might have swept her away. But in her turn, a woman
would wade into the cold sea, her coats high, bearing on
her hips husband or son out to his open boat, so that
he could start his night of exposure dry-shod and warm.
This act of service was noted and illustrated by Burt at
Inverness (about 1726), and it was common in the Lews
before the building of stout piers, that is within living
memory. Strong common sense, sheer necessity in fact,
enforced such mutual services; but the sacrifice entailed
was nerved by anxiety for those in danger, by personal pride
and love. It was also true that it bore hardly on women,
with their readiness for self-sacrifice and their ordeal of
childbirth.

175 What return for their labours did the people get in the
[431] past, it will be asked, and what approach to sufficiency in
a normal year? For the Island, the most thorough of the
[127] five Parish Accounts is that of Harris, with its fascinating
retrospective notes (vol. x, p. 368). There the yield of a
typical family share, a 'fourth' or 'farthing' land, was
computed at "from four to five bolls" (which in Scotland

175 couple advancing one on either side of it—many other
476 tasks were definitely team-work. Such was peat-cutting.
"When they are making peats, five people are employed.
175 One cuts the peat, another places it on the brink of the
476 ditch where it is dug; a third spreads it on the field, a
314 fourth pares and cleans the moss; and a fifth man is resting,
ready to relieve the man that cuts. The women are seldom
462 at this work, but the men help one another alternately;
sometimes they must rest satisfied with fewer hands; but
the above is the full complement of men required to per-
[127] form the work, according to their tastes." Buchanan's
[198] description was written 160 years ago (1793); it remained
true till recently and generally it is so still. There was thus
a normal team practice for work—even a man to rest was not
[538] forgotten! As the Gaelic proverb puts it: "They won't
make power (add strength) without a threesome and they'll
limp without a foursome!" (*Cha deanar treine gun triuir,
202 's bidh iad crubach gun cheathrar*). In Gaelic, as in Scots,
one speaks of a team according to its number, as "a pair,
a threesome, foursome" and so on, up to a tensome
(*deichnear*). In Lewis the farm-team was usually a foursome
or fivesome.

175 Only in exceptional cases was land worked and held
423 singly—as when a smith was kept busy at his anvil in
241 ploughing-time and harvest. Thus in 1715 one or two
[320] rural smiths had single holdings of average value or more
(£1), and one artificer or tin-smith (caird) a holding of
[284] minimum value (5s.); and in the burgh all the small plots
[462] were held singly. As the women wove, at home mostly,
no male rural weaver held a single plot; his weaving could
be done at slack times, so long as there was light; at busy
times he worked on the land with the rest of his team.

On the mainland, both Lowland and Highland, an

175 as some Indian pedlar one meets on the road may seem
433 now. An older packman's tale of his long tramps, of the
[326] people's poverty and hospitality, must have resembled
the mingled plaints and praise one hears from an Indian
[483] pedlar today! But in the past only a speaker of Gaelic
could find his way among the people. Almost until 1900,
[191] if not still later, Gaelic speech was to prove a social bond,
[199] but ignorance of English speech an economic barrier.

The transition to increased exchange, with migration,
permanent and temporary, tended to make for specialisa-
tion. About 1795, *Statistical Accounts* enumerated, for
every hundred families, two or three smiths, wrights (or
carpenters), a shipwright or some boat-makers, a few
weavers, tailors, and perhaps a miller. Each of these held
[178] some corn land, individually or in shares, with rights on
the common. The line between plain crofters (to use a
later term) and crofter-craftsmen was not easily drawn, and
different writers wrote as they judged best. In Lochs,
80 per cent were fishers and net-makers. On the open
shores of the west, in Barvas parish (in which three-fourths
of the men were also 'fishers'), kelp-making was a seasonal
[479] occupation. In Stornoway parish, where sub-tenants paid
30s. to 60s. in rent, with twelve days' service, they sold ling
to their tacksmen at 5d. each, earned £1 a month on herring
boats, made kelp at 30s. per ton, and roads at 8d. a day.

In Harris in 1795 the eight 'bred' (or trained male)
195 weavers worked only for 'the gentry': the laird, the
286 tacksman and their families. The rest of the weaving
462 was done by the women, giving a ratio of only one male
weaver to fifty-five families. But in Lewis male weavers
were commoner—one to every twenty to thirty families
was the ratio—as if the practice of home weaving by the
women was less universal there, even at that date.

175 co-operate in active endeavour. It was all the more
632 important to have an elected 'official', the Constable,
427 one of themselves but placed in authority. There could
be no restitution of the old joint farms where they had
[241] been broken down by migration. Yet it should have been
[674] still possible to extend the old spirit to the larger townships,
as the Commissioners held.

Again, the constitution of the township is bound up
175 with the rights of common pasture upon the moor all the
632 year, and in winter even on unfenced arable; but the
473 Crofters' Act failed to regulate the rights and obligations
671 of Common Grazings. It slackened the authority of the
estate without restoring the hold of the tenant community
upon its members. After five years the Government began
to recognise the mistake, and passed the first Crofters'
Common Grazings Regulation Act, permitting the crofters
to elect a Common Grazings Committee. But it was ill-
considered; most of all because non-crofters, that is,
cottars and squatters without legal tenure, were not bound
by the Regulations. On one hand they could not get per-
mission to 'resume' (or enclose) a portion of the outrun,
in order to reclaim it as a croft, without first obtaining the
unanimous consent of the township's crofters; and in large
[233] townships there might always be an objector. Yet each
cottar could, and did, put on stock, a cow or two and a
few sheep, so nullifying the possibility of discipline.

In 1908 a second Act was passed; but twenty years
had allowed tradition to lapse and difficulties to accumu-
late. In Isle Scalpay (Tarbert) for instance, by 1909 there
were only forty legitimate crofters, but eighty cottars; and
the legal crofters would not take part in depriving any
[476] cottar of such grazing liberties as he exercised. All were
462 neighbours and most were relations, and their principle

175 was to share; the children needed milk and the women
632 wool to work, while the men fished. As the Crofters'
473 Commission put it at the time, "Necessity has no law and
671 . . . it is scarcely possible to carry out . . . the Grazings
Acts in this island." The process remains little changed.
[476] Still, in spite of sixty years' delay, and the law's failure to
462 restore an executive, the Constable, to perform specified
duties as a member of the community, the Grazings Com-
mittees do perform useful functions with credit. They
form nuclei with which proprietor, Government or co-
operative agency actually deal, and the voluntary Clerk
may shoulder considerable responsibility.

195 With regard to small occupiers paying less than £6
632 rent per annum and holding less than 10 acres and 250
473 acres of souming (or share of pasture), the Napier Com-
671 mission declined to recommend the bestowal of rights or
immunities tending "to fix them in a condition from which
they ought to be resolutely though gently withdrawn".
The Act, however, did grant small occupiers immunity
from eviction, and made it hard for either landlord, State
or fellow-crofters even to refuse house sites or fresh hold-
ings, particularly in the crowded Lews. The squatter
continues; indeed he is favoured, by escaping the payment
of rent and rates though he shares in benefits. The rate-
payers are proportionately, and unjustly, handicapped.
But as isolation has diminished, landless squatters have
been allowed to 'resume' portions of the common grazing
for new holdings, as by common consent at Ness and in
Lochs, after Lord Leverhulme's death.

195 A further recommendation of the Napier Commission
632 was to aid emigration. Now Sir James Matheson's aid in
1863 proved successful, but his later efforts met with no
671 response. There were then, and still may be, in the Island

167 left the Island. Yet after 1931 many returned, owing to
losses and unemployment both in British towns and over-
[288] seas. When emigrants began to come home the 'Harris'
[128] tweed industry had spread to Lewis and offered increasing
[464] employment. Some men still fished in family-owned
[226] Island boats, and others as paid hands (on boats from the East Coast), though losses and unemployment were suffered.

178 Inter-war changes were hastened not only by movement
177 beyond the Island—an influence at work for three or four
493 generations before—but by mobility within it. In 1919 a small mail car made its way daily from Stornoway along
[205] each of the five main roads, with an occasional passenger. When crofters crossed the Island to Stornoway they went on foot or took the pony and cart at a slow walk: it was a day's journey. Ten years later, Ford vans, bought second-hand, ran daily to Stornoway from every township. Frequency, ease and relative cheapness of movement came late in an Island with no railway: the mobility of the motor for marketing and shopping brought rapid change.

178 'Hand-loom' weaving had become an important, if
286 precarious, resource, important because of the capital
[433] invested and the labour employed, yet precarious because of its dependence upon name and sentiment, not only
[162] upon intrinsic value. In Harris many women had spun and woven for sale for over a generation before 1914, mostly weaving pure hand-spun yarn, and they continued to do so. For many years before 1914, an occasional weaver was to be found in villages in Lewis too, generally weaving a handspun weft upon a mill-spun warp. By 1939 it was estimated that there were about 1200 looms in the Island, chiefly weaving mill-spunyarn, most of it spun in the two principal Stornoway mills. A carding mill

458 problem remains that Island seamen may thus continue
746 indefinitely to be crofters receiving partial relief, seamen only in name. Without doubt, part-time work on a croft is socially a lesser evil than prolonged unemployment in a slum or semi-slum. The crofter's family, too, is relatively better reared than that of many a poor seaman in Glasgow, Liverpool or Cardiff. Yet if this were all, it would be no adequate life for a man, while continuing to be an expense
[461] to the State. The more satisfactory side of such relief is
[311] that the Islanders, when unemployed, turn to building new 'white houses', and either to making small improvements on their crofts, or as in Ness (a progressive village with a high proportion of seamen), to the reclamation of new holdings on 'skinned land'. In all such cases a means test provides against full payment to those who could do without.

458 To women normally employed in 'gutting', unem-
746 ployment relief is given only at such time as there is no work during the season when it might be expected, *i.e.*
[462] from May or June to December. Gutters from the Island
[228] are busiest for the months from June to August on the West and East Coast of Scotland, and again for two months, from October to November, in East Anglia. The number of Lewis women normally employed was over 1500 in a typical season (1930), the earnings averaging £19 each for the summer fishing in Stornoway, and as much again for the gutting in East Anglia. But the demand fell, and by 1932, for instance, some 250 women were obtaining relief, through Stornoway, in early August, the number doubling during the slack months from mid-August.

181 The tragedy and the danger of any means test are that
458 in effect it asks, not "How prosperous can you become
746 if given help?" but "How poor can you become to qualify

198 so creating a small leak in the purse and in the mind,
207 leaving both a little emptier, week by week. Surveys made
[525] by teacher-members of the Educational Institute of Scot-
[829] land describe the effects on listeners in Highland parishes as pernicious, in the main. The reports of the B.B.C., on the other hand, emphasise their cultural endeavours, and the lightening of house-work and of rural monotony or solitude. Every effort is needed to aid a happy selection in home and neighbourhood.

72 Experiences undergone in war were of very differing
201 types. Many men spent the war years in the Navy, without contact with decent town life, or others in the Merchant Marine. Of combatants in the land forces, the Territorials of the original 51st Highland Division experienced a few months of relative inactivity in France, then of a brief but bitter campaign, followed by long years in prison camps, while other soldiers underwent prolonged training in Britain, followed by severe fighting for long periods, far afield. Lastly, a limited number of men served in engineering or other works of war-time industry, though labouring work, at high wages, kept many of the older men employed at home. Of the women called up for service, some were posted to the Forces, some to the Land Army, and some were
[162] sent to factories. The greater opportunities for women to earn a living wage away from the Island tend to equalise the ratio of the sexes.

177 An experience new to the Western Isles came with the
[464] establishment of Air Bases. Not only did their construction provide high wages for labouring for the older resident crofters, brought daily to the Bases by bus from their townships, but for the first time a heterogeneous mass of men from every part of urban Britain was put down at the doors of these quiet communities—at a time when

464 For a year or two after the war many men and women
[288] returning from the Services, the sea or the factories found
[729] employment in the flourishing Harris Tweed industry. This included work in the spinning mills and hand-weaving at home—work in which the male weaver was helped by his family in jobs such as bobbin winding. Few fishermen
[226] dared to sink capital in new boats and gear, and risk losses
178 such as those sustained after 1920. Few women wished to
177 return to the hard, uncertain work of gutting. The whaling
[462] station, built on West Loch Tarbert before 1914 and open for a short time between the wars, was reopened in 1950, and employed some 30 men for 18 months before it closed
[241] in 1952. Crofting was lightened by some mechanised
[722] cultivation. The war-time construction of air-fields had ceased, though some harbour-work and road-making was
[654] assisted by government grants.

288 In 1949 the Harris Tweed industry, now the Islanders'
251 main source for earning, was crippled by the imposition of
648 a 66⅔ per cent purchase tax on hand-woven Harris Tweeds. Parliament decided that as a non-utility product, its export
[433] sales alone could be exempt from tax. Viewing the position of the tweed industry in Britain as a whole, there were strong arguments for the extension of the tax to
[171] Harris Tweeds: the high-grade industry of the Scottish Border or the manufactures of the West Riding should not be subjected to unfair handicap. At the same time the crippling of a handicraft practised by peasant or artist favours mass-production to the loss or ruin of traditional and experimental workmanship or design to which, in the end, the mass-production is an unacknowledging debtor. The obvious economic handicaps of Island hand-weaving
[439] may surely permit some latitude. The export trade in
[456] Harris Tweed, in which the imponderable 'sentimental

228 boats; value, £15,400. Of this, the greater part came into
434 Lewis creeks (Table 17), making £10,000 for Lewis.

Finally, we may add a round figure for whole or part-time occupations associated with the fisheries, including what accrues by the visiting fleet and its business, of, say, £20,000. This gives a total net output approaching £85,000 from fisheries for a typical year just before 1939.

We now turn to an estimate of the earnings of fishermen
[462] and of the women engaged in curing. To some extent these figures overlap, for the value of the net output includes the wages of fishermen and women; but the sums earned on 'stranger' vessels—reduced now to some £3000—and the wages earned by women gutters and curers in East Anglia
[436] (about £10,000) are additions to Lewis income. Some of this was, no doubt, sent home in the form of postal orders, etc., causing a further overlap, but much of it was probably sent in the form of notes or brought home in cash. In order to show the real net earnings of rural Lewis, these are separated from the output shown in the first column ((A, i) on p. 314) and are tabled under "Earnings by Crofting and Associated Rural Occupations only" (A, ii).

[127] (*b*) *Fishers' Earnings.*—As no figures of local earnings are separately published, estimates must be based upon the collation of the Fishery Board's *Annual Statistical Tables* and
[178] accompanying *Annual Reports* with careful local enquiries. By 1938 the fishermen on Stornoway District herring fishing vessels were reduced to about 350 men and boys in the summer season, of whom only a few worked in autumn and winter. Their earnings included the earnings of share owners of boats and of nets, and of those without shares, the latter being only a fraction, say a quarter, of the total. Nearly 100 District men still worked on 'stranger' (East Coast) vessels at the summer fishing and rather fewer at the East Anglia autumn fishing. The sum so earned may have been a third or more of the earnings on District vessels. Altogether the total net earnings from herring fisheries received by all fishermen from Lewis proper came to little more than £8000. By 1938 the

228 average wage for the summer season dropped to about £25.
434

The number of women engaged in gutting and packing (and kippering) herrings varies from year to year. In 1938 1000
228 were engaged locally in summer, most of whom also went to
434 East Anglia. As always, the greater part of the wages was earned in the summer and the remainder in the East Anglia
462 (autumn) fishing season. The net average earnings per worker of the Scottish gutters and packers were estimated at £16 at the Scottish summer fishings and £17 at the East Anglian fishing (*Annual Report*, p. 12). This figure included 'arles' (*i.e.* earnest money), but excluded travelling expenses. The Stornoway District earnings averaged £16 at the local summer fishing but only £15 at the East Anglia fishing. The latter is a small return to place against the skill of the worker and the discomfort she endures. The women work in small teams together, and their efficiency is partly due to their comradeship.

228 Figures for catches have already been given as approaching
434 £20,000 for herring and £10,000 for white fish and shell-fish. While the net earnings derived, after subtracting the working expenses of boats and outlays for gear, were very much less than this gross sum, a substantial part should be counted as equivalent to earnings (Statistical Table 21).

Summing up the total net earnings, we arrive at the follow-
[462] ing for Lewis proper. The women's total net earnings may be taken as £25,000. We add to the probable earnings of the men at the herring fishing an allowance for their profits from other catches, making a total of say £15,000.

198 The industry was still declining here as elsewhere in
228 Scotland. About 1930 the earnings of hired hands alone reached £30,000 and that of women twice as much, say £60,000.
434 Besides this was the important sum earned by men with share of boats. The local white fish and shell-fish catches were also
[682] considerably higher at that period. As to the future, much will depend on what can be done to rehabilitate the local industry by compensation for losses incurred in war, and by assurance that government policy will encourage local fishermen to embark on their enterprise without the risk of the

Since 1939,
166 54 people have emigrated whereas only 4 have immigrated. Most of the girls have to
462 leave home when they finish school as there is no employment locally. Many of them go into domestic service or nursing in Glasgow. Many of the younger men also spend time away from home, often in the Merchant Navy. Breasclete is also the temporary home of the families of lighthousemen on duty in the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides the main source of income. This is a rather irregular occupation owing to the uncertain demand for the tweed, and although the men are nominally self-employed they rely on the mills to supply them with work. The tweed is woven on treadle looms, which, with ancillary equipment such as bobbin winders, are all owned by the crofters.

[458] As 1959 was a good year for the tweed industry, there was an air of prosperity in the township, and with the aid of government housing grants many new bungalows were being erected. But should there be a slump, the crofts would be unable to support the population and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
133 a' Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs, for westwards to the sea the terrain is too rocky and irregular for either settlement or
36! cultivation, whilst to the east of Loch a' Bhaile the land slopes precipitously from 250 ft. to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle drift-covered slopes, generally of small extent.

Cultivation is very noticeably limited to three areas - along the west shore of Loch
137 a' Bhaile, along the north-east shore of Loch Shader, and in the valley of the small stream draining from the north into the head of Loch a' Bhaile. Most of the croft land is com-
[241] posed of rock outcrops, rarely exceeding 100 ft. in height, separated by damp depressions frequently filled by reeds and rushes; bracken was apparent only on three crofts. In particular, the area between the two lochs is badly in need of draining and is largely colonised by reeds and very coarse grasses, of no use whatsoever as pasture. One enterprising person suggested that the township should hire a ditching machine - this could certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
311 2 holiday bungalows, with the croft holdings aligned north-east/south-west between the two lochs and the sea, except for nos. 28 and 29. The 53 holdings are unofficially
427 amalgamated in various ways and so reduced to 35 operative agricultural units. The acreage of crofts varies from 2.2 to 20.75 acres - a considerable variation. Fencing of the crofts - except for 1A, B, and C, and 12A, B, and C which are held 'run-rig' - was carried out between 1945 and 1950, whilst in 1946 the common pasture of 2,700 acres was fenced into two parks - an inner and an outer one, the division coinciding with the Carloway to Breasclete road. An area stretching from crofts 18A to 21 has, however, been most haphazardly divided. The seaward halves of some five crofts were redivided amongst seventeen crofts in the southern half of the township to compensate them for lack of grazing area within their own croft boundaries. This division is said to date from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
[Ser] small mechanical cultivators. Ploughing by tractor and horse, as opposed to spade cultivation, depends either on the urgency of the operation, or on the accessibility of the plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

of unit; the result (Table 45) does not suggest that the possession of a large agricultural unit encourages a man to become a full-time rather than a spare-time agriculturalist. Indeed, the possession of a large unit, built up by amalgamation, is often a fortuitous result of marriage, death, or inheritance, rather than a matter of individual choice. The only significant correlation in the table seems to be the understandable tendency for female croft workers to work the smaller, rather than the larger, crofts.

[462]

241 The cultivated land

311
631

The chief crops are hay, oats and potatoes, in that order:

DISTRICT	Acreage of: Oats	Potatoes	Hay	All Crops	Average per unit
South Uig	149	50	209	407	2.5
Bernera	121	38	69	228	2.0

a temporary feature in 1959 due to the casual employment provided by a hydro-electric scheme at Gisla (Figure 46).

[88] In this respect the critical age-group is 15-44 years (table 54). Few older people take work away from home. Of this age-group, 338 (out of 931) persons are away. Women account for 199, men for only 139; the difference is a strong indication of the lack of employment opportunities for women in Lewis. The contrasting experiences of the different districts are quite remarkable (figure 46). A far greater proportion of men goes away from the two northern districts than from Bernera and the South, and this despite the greater importance of weaving in the north. The explanation for this lies partly in the generally smaller size of crofts of the north, partly in the type of employment available locally and partly in the customary choice of employment away, which differs from district to district. Social custom, which may vary as between one town and the next, has a strong bearing on whether and where young men and women choose work.

(2) including 11 (11%) full-time fishermen.

compared with 34.9 for Scotland. The death rate among Skyemen, 175* however, was 17.4 compared with 22.0 for Scots in general. But 178* Scotland had a net emigration rate of only 3.6 while the Skyemen 165 167 were leaving at a rate of 16.5. In this decade no fewer than 3,115 left Skye.

By the end of the third period an additional influence 175* of the process of commercialization had become apparent. The 178* social hierarchy was modified in the direction of greater 565 161 socio-economic differentiation.[68] At the time of the "Forty- 162 five" Skye was inhabited by the families of three clan chiefs, 139 tacksmen, 517 joint-tenants, 1031 subtenants, and 444 servants. There were now 10 landlords. The tacksmen had been replaced by 29 graziers and 12 small farmers. The joint-tenants, subtenants, and servants had become 2043 crofters and 1227 cottars. In the past there may have been one innkeeper, at Portree, and a few millers; now there were 32 innkeepers, millers, and merchants.

The changes which we have been considering could not have 175* left the patterns of interaction undisturbed. Cooperation among 178* the members of the township would have been unnecessary. Since 182 476 all were affected by prolonged destitution, mutual aid must have been severely curtailed. The extended family was broken 596 by emigration. The nuclear family was seldom intact for more 597 than part of the year. It seems the majority of the able-bodied 175* men were travelling to the east coast each spring to find 178* 182 464 462

175* 178* 182 464 462 employment as hands on fishing vessels. The young women followed these fleets seeking work as gutters and curers in the ports. Some may have made their way to Portree, where a woolen mill had been erected by the Highland Destitution 161 Committee. The population of Portree increased during these 162 years from 510, in 1841, to 893, in 1881, but this can hardly be regarded as a significant trend.

175* 178* 183 181 559 713 The really striking aspect of this period is the almost complete lack of protest by the Sgiathanach against the violation of his presumptive right to the land. The disappearance of the tacksmen, of course, had left the people without their counselors and leaders in secular affairs, and many of the ministers, especially those who were themselves sheep farmers, counseled submission to the will of God. Then, too, the ethos of the Skyeman would not allow them to ventilate their grievances. 187 They despised the Sassanach and felt that "the landlord was bad enough, but the factor was the Devil himself." Still those who knew them well and those who rambled by their cottages wrote unanimously of a people who endured overwhelming sufferings in patience and reticence.[69] The betrayal of any weakness, especially before the cursed Sassanach, was a breach of propriety.[70]

175* 178* 668 The Skyeman had not lost his capacity to respond to leadership. Throughout the nineteenth century there had been widespread and growing discontent all over Europe with the

ing, the crofter turns his attention 221
rch or early April he has ploughed, 241

manured, harrowed, and limed his fields. Normally, he will 221
have a tractor to speed his work. In the meantime his wife 241 [462]
prepares her small kitchen garden. By the time he has sown
his oats and set his potatoes and turnips, the ewe sheep are 221 231
ready for lambing. Lambing begins during the last week or two
of April and runs through the middle of May. This is one [462]
activity which is exclusively man's work. It is also a chore
which demands an early start from individuals who are normally
late risers, seldom getting started before eight or nine in
the morning. Now, all day long, from early morning until late
at night, day after day, the crofter or his shepherd are found
on the hill watching and waiting for the lambs and their
natural enemies, the crow, the hawk, and the fox. During this
time, he does not neglect feeding his cattle nor finishing
putting in his crop if inclement weather has hindered his
progress. Then, too, he may have a cow ready to calve. His [462]
wife will then add milking to her regular household duties.
Men have only recently begun to milk.

After lambing, the family must decide whether or not 221
they are going to take time out for cutting peat. As I have 314
already said, it is unlikely that the man of the house will
want to bother. He has enough to do caring for the sheep and 221
lambs and preparing his cattle for the May markets. Although 231 432
he could attend the local sales which are held at convenient
locations around the island, the large crofter has found the
mainland market of Dingwall attracts buyers willing to pay
higher prices.

or second week, the ewe sheep are sheared. Shearing is an- 221
other cooperative task. The men and women work together 236
with only one significant division in their labor. Women [462]
never shear. Their task is to run the sheep through the pens
and fold the fleece after the two men shear the animal. An-
other chore is added to the crofter's schedule at this time.
He must begin to watch his sheep for maggot.

The haying season runs through July and August, depend-
ing on the weather. In August the sheep have to be dipped again
this dipping prescribed by law, and the wedder lambs (castrated
males) are sent to market. In September, if the weather is
favorable and the season has been good, the harvest of oats
begins. The man works with a scythe. Women never cut. His [462]
wife helps by binding the corn in sheaths by hand and making
stoops in the field. Later she helps her husband build the
stacks for winter storage. As in any summer month, the stock
requires attention. Cast ewe sheep (sheep over six years old)
and old rams are sent to the Ministry of Food grading station
at Kyle, on the mainland, to be graded for meat or to Dingwall
to be sold at auction. Cattle sales are also held on the [43
island in September and again in November, but the full-time
crofter prefers the Dingwall auction. The rainy season is [13
now, as noted, reaching its height. The pace becomes slower.
October, November, and, perhaps, even December are spent trying
to dig potatoes and turnips. Too often the oat harvest has
yet to be completed and the sheep must receive their second
statutory dipping. Sometime before the end of November the

1. Principal workers of crofts: most women take some part in the working of crofts, planting potatoes, haymaking and harvest work, peat securing, etc.

/p. 10-C/

However, not all such
166 employment is available in Park: 47 percent of the insurable male population
167 leave the Hebrides to find employment; one third take seasonal employment, and two-thirds
464 permanent employment furth of Park (See Table VIII).

Employment within Park

288 Table IX shows that opportunities for local employment are strictly limited. Weaving of
464 Harris tweed is the most important single source of employment. It is significant that those engaging in it are almost all crofters working in their abundant spare time. Weaving is an ideal adjunct to croft work as it is unaffected by weather or hours of daylight and thus can be performed during periods of agricultural inactivity. The vagaries of the Harris tweed market make the occupation precarious; Park is one of the more inaccessible areas of Lewis and the mills are apt to give their commissions to the weavers nearer at hand around Stornoway when
[178] work is scarce. Since 1952, the number of weavers in the fishing townships of Cromore, Marivig, Calbost and Gravir has grown from 11 to 22 and much of the credit for this is due to
[228] the activities of the Pairc Association. Fishing, on the other hand, has lost ground in the same period: the number of fishermen has declined in these townships from 20 to 14[1]. Apart from
463 weaving, service occupations form the only other employment available, shop-keeping, driving,
464 and road maintenance being the chief occupations in the service group. There are very few craftsmen: with such a small population, and the long established tradition that the crofter builds his house and is his own tradesman, there is little opportunity for a trained builder, joiner or even shoemaker to make a livelihood. The professional class is small and entirely composed of the minister and missionaries, the doctor and several schoolmasters.

[462] There is little opportunity for women to find employment in Park, apart from nursing, shop-keeping and school teaching, and a few domestic service posts (See Table IX).

Employment furth of Park

166 The persons in the 15-44 age group form the main body of those working away from home.
167 The distinction made between 'seasonally away' and 'regularly away' is that the former group
462 spend part of the year elsewhere, the men on whalers in South Georgia or with the Tay Salmon
463 Fisheries at Perth, or labouring on the mainland. The women are in domestic service, mainly
464 in hotels. A majority of the men in the latter category are in the Merchant Navy; in some cases these men take leave to coincide with the spring work and the harvest. The majority of the women are in domestic service (See Tables IX and XI).

An interesting comparison in the 'regularly away' group exists between men and women in the professional classes (Tables IX and XI). The sample is small, but it is clear that more women than men attain professional status. The number of domestic servants, nurses, and merchant seamen is a reminder that the crofting districts provide a pool of labour for certain vital occupations, some none too popular in Britain as a whole. In people alone, one can say that Park makes a distinct contribution to the fabric of the national economy and this contribution is much more apparent outside Park than within the district. At the same time a majority of those who are temporarily or permanently away eventually marry and settle outside the district and thus a most valuable section of the community is constantly moving southwards. Only 35 per cent of the men in the 15-44 age group are wholly resident in Park, and 46 per cent of the women in the same age group, a reflection of the poor prospects and utter inadequacy of resources on the most of the crofts.

1 The 1952 figures are abstracted from the Lewis Survey Report on part of South Lochs.

6. Ducey	E-4,5	(1953-1954)	1956	ES10 Highland Scots ES10 Skye

The labor in this pastoral-agricultural economy is provided by the crofter's family, periodically aided by some or all of the families who share in the common grazing.[11] Under the direction of the father, the mother and children care for the crops and cattle. Heavy work, such as ploughing, reaping, and feeding the cattle in the winter, is left to the men. The women milk the cattle, help at the harvest by raking and stacking, and care for the garden. Although men never do any work in the house, in the absence of a son the wives and daughters are expected to fill in the gaps in man's work in addition to running the household. Inter-family cooperation centers on the handling of the sheep. Frequently, the families who share the common own the sheep collectively, as a "club stock," and share in the expenses and profits as well as the labor. The only basic pattern in the division of labor is that women never shear, and it is their responsibility to feed the group.

Formerly, the annual economic cycle was adjusted to the demands of crop cultivation and cattle breeding. Within the last hundred years, however, sheep have assumed commercial importance and now determine the seasonal tempo of labor. The old year ends and the new begins with the bringing in of the rams from the hill. In March the sheep are dipped and then the preparations are made for the lambing season, in April. From spring until autumn there is a rapid succession of duties: ploughing, planting, peat cutting, dipping and shearing the sheep, stock sales, harvesting, and similar tasks. After the

[11] Cf. Ibid., pp. 63-64, 70-74.

*175 *178 427 233 166 167 425 162 [161] squatters without any legal hold on the land. In Duirinish parish, which includes Glendale, only twenty-one families had enough land to meet even subsistence needs.[62] In one Glendale township, Holmisdale, some crofts of fourteen acres had as many as fifteen people to support.[63] Part of this extreme congestion was due to the continued practice of subdividing one's croft when a child married. Although the population in 1831 had fallen to 17,680, from 23,084 in 1841, almost every township had two or three times the number of families which had lived in them in 1841.[64]

*175 *178 427 233 241 [439] [262] [452] The loss of the summer shielings and the common grazings meant few could keep sheep.[65] The looms were silent. Since the rent continued to be based on the value of livestock and was wholly or partially paid from the sale of cattle, all oats, which the graziers' sheep did not eat, went to feed the cattle. The mills were all but idle. The people had to buy flour, meal, and bread imported from Glasgow. Almost all were heavily in debt to the local merchants, who seem to have been newcomers with more associations with the graziers than the crofters and cottars. Milk became a precious commodity. Frequently, the old cow had only enough for her calf. Unable to keep horses, the women became beasts of burden. They carrie

	Croft-work only	Croft-work and weaving	Croft and other regular work	Croft and periodic work	No croft work	Total (100%)
g Parish	11	43	16	15	14	(635)
stricts						
South Uig	13	27	22	24	13	(188)
Bernera	8	36	25	19	12	(130)
East Loch Roag	9	50	11	11	19	(146)
Carloway	16	61	6	6	13	(171)

Table 55 and figure 47 summarise the main sources of employment. The small group ngaged in 'croft-work only' may be briefly dismissed. A large proportion of these men re elderly or otherwise infirm; a few are pensioners (e.g. retired police or service nen); very few indeed are fully occupied in the agricultural work of their crofts, thus full-time crofters' is a misnomer in this area.

The most important category, in all districts, is 'croft-work and weaving', but it is elatively far less important in the south where there is correspondingly greater reliance n other forms of regular employment or on periodic work, i.e. casual labour.* It is ifficult to overestimate the significance of weaving in all districts. It is the only subtantial source of income in the parish and it should be clear from the previous chapter hat weaving is not an ancillary occupation to croft work except in a few cases in the south. 'he weavers are not 'crofter-weavers' so much as 'weaver-crofters'. A curious distinction between Carloway and the rest of the parish is that, whereas generally weaving is oung mens' work, the great majority being under 45, in the Carloway area two-thirds of he weavers are over 45. The historical reason for this may be the earlier spread of veaving into Carloway than elsewhere for, although some weaving has always been done hroughout the area, it only became a major source of employment south of Carloway in he last 20 years or so. Thus few of the older men in the south learned weaving when they vere young. A corollary is greater dependance on the Merchant Navy as a source of mployment for young men from Carloway than for those from the south.

Other sources of regular local employment are lobster fishing (Bernera only), gamekeeping and other estate work (Bernera shore and South Uig), and government establishments (South Uig). In addition there are the usual services - postmen, haulage contractors,

* For a detailed discussion of the significance of weaving see Moisley, H.A., Harris Tweed - a growing Highland industry. Economic Geography, 37, 1961, pages 353 - 370.

5:	Caird et al.	K-5	(1958)	1959	ES10 Highland Scots Park ES10

Recent trends also point to a decline in the numbers of sheep, although more are kept now than fifteen years ago. From 1942-51 the numbers were more than doubled (263-565). A great deal of this increase must have been a result of the ewe subsidy, but part at least may be connected with the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have since fallen steadily. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of the year these sheep are grazed on the common pasture on the moor or on the eighteen acre island in the bay. In August, however, the lambs are gathered in for weaning and dipping; in November the gates are opened and all the sheep allowed to graze on the cleaner pasture within the croft boundaries. If necessary they are given fodder, but from the beginning of January they are encouraged to return to the moor, although the gates are not 'officially' closed until May.

The total area of the common pasture exceeds 1500 acres, but most of this consists of hummock waterlogged peat moorland supporting only poor quality coarse grasses and sedges. Over 700 sheep now graze this area and the apparently large common pasture is in reality drastically overstocked, a process which must inevitably harm the animals as well as the land.

No pigs or horses are to be found in the township and each crofter keeps very few hens, normally just sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold to the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

It can be appreciated that crofts of this size and quality can neither provide the crofter and his family with sufficient income, nor fully occupy the available labour force. As a result, people in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primarily a fishing township". Today the herring fishing has disappeared entirely and only one crofter still does a little lobster fishing, sending his catch direct to Billingsgate.

There are now 45 people resident in Orinsay but an examination of their ages reveals that less than half of them are between 15 and 64 years. Indeed there are only six resident males between these ages, and three of these spend at least part of their time working away from the township on the Eishken estate.

As there is neither a school, post office, shop nor garage in Orinsay, there is no available occupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 44 are permanently away in the Merchant Navy, returning home only for holidays, while another third are seasonally away with the whalers. Similarly almost half of the females of similar age work in domestic service in Glasgow. It must be realised that most of these people working away assist their families at home, and that a large part of the croft incomes are made up of money sent home, together with pensions and other allowances. Emigration from Orinsay to other areas has continued steadily, twenty people leaving the township since the war.

On the whole, housing conditions are good, due to relatively recent construction. There is only one traditional black-house, and even this house has electricity: only one house is without it. Water supply is not so certain as wells and springs are the only source. The township lacks a telephone and a shop, but is served by travelling vans. A good road, constructed within the last decade, connects Orinsay with Gravir; entering the township via the valley to the north-east, it serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles distant.

Like so many other crofting townships Orinsay, above all else, gives an impression of congestion. The self-same hills that provide shelter also restrict cultivation. The crux of the situation is that land, extremely marginal in character, is being worked by too many tenants on holdings too small to be economic. With three residents to every two acres of cultivated land, Orinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in the 'twenties

The Spare-time Crofter. Under this type we must include not 231
only the able-bodied, married man who tends to become a full- 241
time wage earner, but also the old, pensioned, married and 887
unmarried men and women who are no longer able to perform
the necessary chores. For the latter, whether they have a
small or medium-sized croft, the croft becomes a means of
living within a pension rather than a potential source of
livelihood. For the former, the croft becomes a means of
living cheaply.

When the crofter goes out to work, he either tends to 231
neglect the croft or expects his wife to manage it. Oc- 241
casionally, the husband will help with the ploughing or the 593 462
harvest in the evening, but he never lends his wife a helping
hand in her domestic duties. The only men on the island that
I knew who helped their wives with the dishes or the care of
the children, except disciplinary measures, were a minister
from the Outer Isles and several Lowlanders in Portree. Since 312
very few crofters have plumbing, the wife must fetch water
from a well and dispose of waste in the nearest stream. If
there is to be a supply of peats, she must cut them. If
there are cattle and sheep, she looks after them. Lambing
may be left to the township shepherd if the crofters can afford
one, and shearing is usually left to the men of the township.
An exceptional spinster or widow may shear, but it is indeed
an unusual married woman who will break with the traditional

313 point cultural considerations enter. The land is often essential to the continued existence of the farm or the crofting township. In Sleat, for example, the land which the Forestry Commission has listed as commercially valuable is the lower, sheltered 313 824 grazings of several farms and crofting townships. Finally, there is the people's dislike of trees. Many a Sgiathanach in Portree is distressed by the plans to cover Glen Sligihan with a forest. They share the attitude of a man from Soay, a small island a short distance off the west coast of Skye, near Glen Brittle, who was being moved to the Isle of Mull by the Department of Agriculture when Soay was evacuated at the crofters' request. "Och, its all right down there, but you can't see the sky unless you bend over like this," he said bending over double and looking over his shoulder.

464 [162] We have now accounted for, at the most, 120 men and 20 women who work for wages and 238 crofter-fishermen. Excluding the latter, there are over 1000 men and almost 500 women who are employed locally at sometime during the year.[32] With only a few remaining isolated industries, such as the small silica sand quarry at Ord in Sleat and the infrequently used limestone and marble deposits at Broadford in Strath, most of the opportuniti for employment have to be in services for women and laboring for men.

462 464 Let us consider the occupations of women. Over half are employed as resident domestic servants or as help in hotels and restaurants. Ten percent find work in the local shops as clerks.

---

[32]Information extracted from the files of the Ministry of Labor in Scotland, Portree and Edinburgh.

equal number, but mainly newcomers to Skye, are teachers 162 464
nurses. The remainder are employees of the national and
unty government, serving as postmistresses and clerks. In
ition, an indeterminate number of women, in Portree and in
rural hinterland, but none in Kilmuir or Glendale, add
their income by taking in summer visitors. This practice is
strictly legal for the crofters, in as much as it casts
bt on the agricultural valuation or devaluation, but the
unty government has not attempted to discourage the practice.

Turning to the men of Skye, we find that the largest
loyer is the county government, with well over 200 men on
payroll as road workers and general laborers. The national
ernment, directly and indirectly, in recent years has employed
ther 200 or more men through the Department of Agriculture,
overseers, agricultural workers, and laborers; through the
th of Scotland Hydro-electric Board; and in the post offices.
we add the number who work for the nationalized ferry service 557
the subsidized steamer service, we find that over half of
wage earners on the island depend on the government for
ir wages. The only other fields open to men are in agriculture,
farm help or township shepherds; in transport, as bus and
ck drivers; and in hotels, as barmen, waiters, and porters.

These jobs are by no means permanent or regular. It is 464
at all unusual to have 300 or 400 unemployed during the
ter when road work falls off and the tourist season is ended.
y will then draw compensation from the Ministry of Labor, 795
will the younger men and women who have been working on the

554 by leaving, for if he fails to conform to the traditional norms
and patterns of behavior, he will be looked upon as an eccentric.
This fact has continuity through all periods of Skye's history.

554 We have already seen how the age and sex structure of the
176 population has changed in response to social and economic
conditions and how this change has influenced the ascription
of statuses within the crofters' division of labor. Briefly,
there has been a contraction of the number of opportunities
463 for ascribing status. This had made it necessary for some
men to perform tasks once the exclusive domain of women and for
women to participate in activities which formerly were the
887 responsibility of their men folk. Older people must now
function in ways which once were the responsibilities of the
youth and young adults. These changes, however, have been
accompanied by persistencies, in particular a continuity of
basic status values. I think this will become clear through
a discussion of the family structure. We shall begin with
the nuclear family.

554 The Nuclear Family. Since my interest is in status, I shall
129 adopt the unorthodox procedure of considering the nuclear
family in terms of the changing status of the individual members
from birth to maturity. This will give us a dynamic picture
of family life. At birth the individual's relationships with-
in the crofting family and, to a lesser degree, within the
township are established. Like those of his parents, who
now have the ascribed statuses of mother and father, his
relationships will remain unchanged until he marries and founds

alternating generations and being felt as an obligation to 553
perpetuate family names, these various practices serve to
limit confusion among a people who share rather few surnames.
I never knew a child who had been named for his parents.

The relationship of father and child is formally es- 851
tablished at baptism. As we shall see in the following chapter,
the mother takes little or no part in arranging for the sacra-
ment. The spiritual welfare of the children is the father's 543
concern. He is also the disciplinarian, but in the pre-school
years discipline is lax. Both parents freely indulge the child,
and they spend a great deal of time with him. The belt, an 864
ever-present, ever-threatened means of punishment, only appears
when the child assumes the rights and duties which he will
exercise as long as he remains on his parents' croft.

When he begins school at five or, in remote townships, 847
at six, the rights and duties determined by age and sex begin 462
to emerge in perspective. Actually, the child has already
begun to make a pretense, playfully imitating his or her father
or mother, at assuming his role, but the influence of the
sex category is not marked. A small boy may fetch some peat
for the fire or some water for the dishes. Once he starts
school, he is no longer asked to do those chores. As soon
as he is able to carry a pail he may feed the chickens; now
he only feeds the calves. His first real task is tending the
cattle, bringing them down from the hill and driving them out
after the milking. As time goes on, he learns how to plant
and dig potatoes, cut turf, harvest hay and oats, and at last
how to shear sheep.

847 A girl also makes an early pretense at assuming her role.
462 While a boy is never seen helping within the house, and, there-
fore, his duties begin later, a small girl soon begins to help
make beds and do the cleaning. If she is an only child, or
has been left behind by her brothers who have left the Island,
she is expected to take their place on the croft. In any
event, she will be taught how to milk, how to plant a garden,
and how to help in all other tasks of crofting, except cutting
563 corn and shearing. She learns at a very early age and in
diverse ways that the primary role of a woman is to serve the
needs of man, some man, throughout her life, unless she is
strong enough to live alone.

Learning the virtues valued by their parents and the
community, as well as the tasks essential to crofting, both
boys and girls are indoctrinated with the ethos of the
Islander long before they can understand the importance of
their object lessons. They are separated by more than the
division of labor of their parents. As we shall see, the
almost unaltered status values of the culture relegate males
and females to two different, but complimentary, spheres of
activity.

871 As they progress in school, conflicts begin to develop.
132 In one way this is inevitable. Until 1953 there was no
attempt to teach the children anything that would directly
relate to the life expected of them on Skye. In particular
there were no agricultural subjects. Even now, there is but
one travelling teacher of agriculture to serve the entire

Additional modifications have been found in the division 178
of labor. Although no Skyemen has shown a disposition to assume 182
462 responsibility for domestic work, unless he lives alone, the
women of Skye are expected to function in roles which once were
filled exclusively by men. Old men and women for many years 544
now have continued to perform tasks which formerly were their
duties as youths and young adults. These changes, like those
we have outlined, are partially traceable to an incomplete
adjustment to the contractual, commercial world. This has led 162
to striking alterations in the age structure of the population
for it is the youth who forsake the Island and the aged who
yearn to return. Nevertheless, there have been no observable 554
changes in the status system of the rural neighborhoods.
Primitive democracy, distinguished from our form of democracy 421
by the principle of unanimous consent rather than majority rule 874
continues to operate in the townships. The existence of such
an institution implies a maximum of equality co-existing with
a minimum of authority. The continued ability of the crofters
to maintain primitive democracy in a nation like Great Britain
is possible only because there is a high degree of social
integration. The simple system of ranking, on the basis of 567
age and sex, has persisted. Men are the social superiors of 562
women; old men are the social superiors of their juniors. I
believe we shall understand how continuity of status has been
preserved if we turn to a consideration of the role of religion
on the Island.

If I am right in asserting that a belief in clan brother- 178
hood was an all pervading cultural pattern in bygone days and 182
619

463

463 OCCUPATIONAL SPECIALIZATION--number of partially and fully specialized occupations; major occupational categories (e.g., learned and artistic professions, independent industrial and business entrepreneurs, managerial personnel, independent and tenant farmers, government officials, clerical and white-collar workers, skilled artisans, semi-skilled and unskilled industrial workers, farm laborers, domestic servants, slaves); general information about occupational specialization; vocational guidance; specific information on occupations not classifiable elsewhere; etc. This category is designed for summary statements about occupational specialization; in nearly all instances specific information will be classified elsewhere under a wide range of functional and occupational headings. See also:

Stratification of occupations by time and caste . . 56 Status, role, and prestige 464
Occupational composition of the population . . 162 Vocational education 874

000 24,863 acres. The value of this boggy property, as
423 far as the landlords are concerned, is determined by
424 its fishing potential. The landlords generally reside
224 away from their property, and brave the buffeting gales
several times a year to return to fish for trout and
463 salmon. For the rest of the year they hire river-
635 watchers to prevent their tenants from poaching. As
971 in Wales (Emmett 1964), the islanders continue to poach,
in part as an expression of their identity as independent countrymen, a minority group in a nation-state.

161 Lewis is the most populated area in the Outer
162 Hebrides, containing 21,934 of the 32,607 Outer Hebrideans
631 numbered in the 1961 census. It is part of the County
of Ross and Cromarty, whose headquarters are on the
632 mainland near Inverness. Lewis has four administrative
areas called civil parishes in which births, deaths
197 and other vital statistics are recorded. Stornoway
parish is the largest, containing the town of Stornoway
on the east side of the island in which many non-Gaelic
speakers live. Of the other three parishes, the largest
162 is Barvas which stretches along the west side of the
199 island and contains 4,331 persons, of whom 94.66 are
Gaelic speakers. The people of Stornoway refer to someone
186 from the west side as a siarach (west-sider), a term
which connotes rusticity.

632 distinctive geographical features, and nearness to the
363 sea: Ceann a Stigh (or Ceann a Stigh Bhaile, or Baile
102 Stigh, the "town" at the "head" of the road "in" by the sea), Buailebhir (an area identified with the keeping of cattle), Gearraich Mor, Creagan, Pluic, and Mach a Chui ("out the back," by a road built relatively recently). A street which leaves the main road and cuts into the moor, or common grazing land, is called Grinnbhat, from the name of a nearby loch.

The presence of a large Harris Tweed mill in
511 Shawbost has contributed to a high standard of living
[348] within the village. It is estimated that only 25% of
[288] the households of rural Lewis have cars; about 50% of
[498] the households in Shawbost possess them. In 1970
[642] Shawbost had only one occupied high-duhh, or "black house" built of dry stone and roofed with thatch, which to many islanders symbolizes a past life of poverty and adverse times. Modern appliances such as refrigerators,
[494] deep freezers and electric toasters are common in
[251] Shawbost. Most homes also have television sets, and
[207] many have telephones.
[206]

The mill in Shawbost employs between 60 and 70
238 persons to dye, card and spin yarn, to prepare the yarn
463 in warps which are then delivered to weavers who work in their own homes, and to darn, wash and market the

238 finished lengths of tweed. For a tweed to be classified
443 as "Harris Tweed," it must be hand-woven by Outer
[429] Hebrideans in their own homes, but the weavers are
238 essentially employees of the mill. All the large Harris Tweed mills in Lewis, except the one in Shawbost, are located in Stornoway. A few smaller businesses, which design and market tweeds but have no elaborate machinery to process the tweed further, are scattered throughout the island.

The village of Shawbost is composed of 169 households,
621 of which 110 are headed by "crofters," persons recognized
142 as legal tenants of a croft. Of the remaining 59
[429] households, 16 rent houses which were built and are
[341] maintained by the County (called "council houses"), 11 have erected houses on the crofts of relatives, and 32 have built homes on the common grazing lands. Non-
443 crofters participate in the agricultural activities of
21 the township. It would not be unusual, for example, for
118 a non-crofter to serve as the clerk of a grazings committee.

342 In North Shawbost, one croft house and two non-
124 croft houses are used only when the owner returns to Shawbost from the mainland for a holiday. The school-
[375] master lives in a house adjoining the school, and the
[143] minister in a manse located between Shawbost and the neighboring village of Bragar.

175 dyeing the wool it was spread out, dried and sent to
283 Stornoway to be made into yarn. The yarn was then sent
175 back, and the weaver wove and washed it. About six women
284 were required to do the waulking (the process by which
[142] the cloth was washed and shrunk).

175 "In those days the weavers designed their own
284 patterns, and sold their own finished tweeds. I remember
432 going into town with my brother, we had two tweeds in the cart. We went into a shop to sell the tweed, and the man said it was poor weaving. He didn't want to pay the full price for it. I told my brother to roll it back up, we would take it somewhere else. As we left the shop, he told me I had 'good cheek.' In the next shop the merchant didn't say anything, and gave my brother the regular price. We went home with £60."

236 The great demand for tweed encouraged the development
258 of more efficient methods of production. One by one the
178 various processes of production were taken over by
118 specialists, and gradually these specialists were brought
433 together under one roof. Large boilers for dyeing wool
[434] were supplied as a result of actions taken by the Congested
143 Districts Board, which was formed in 1897. The Scottish
[38] Home Industries provided chemical dyes. The most
236 difficult and time-consuming processes were carding and
223 spinning, which small mills on the mainland began to do

285 on commission for weavers around the turn of the century.
283 By the early 1920's, four mills on the island were
175 carding and spinning wool on commission; and one mill
284 brought looms into its premises. Lord Leverhulme, who
[283] bought Lewis in 1918, saw the value of concentrating weavers in one place and of improving the technology. He encouraged the introduction of Hattersley domestic
463 looms, which eventually replaced the wooden looms. The individual weaver also did his own warping, but after World War II the mills began to hire warpers to work full time on mill premises. Transporting the tweeds, which used to be the responsibility of the weavers, is now the responsibility of the mills. Today all processes except the actual weaving are handled by mills, most of which are located in Stornoway.

Such steps in specialization and centralization made sense to the weaver. One of the older weavers recalls,
175 "In the late 20's or 30's you could buy a yard of Harris
238 Tweed for about two shillings. It wasn't economical for
135 any crofter to dye and spin the yarn, weave it and sell it for only two shillings a yard. As the mills enlarged, they could make it with the machinery because they could make it an economic proposition."

However, the tendency toward specialization and
175 centralization was in direct conflict with the reasons

465 yards (a weaver's yard is equal to 8 feet, a measure
238 which derives from the size of the frame once used
[504] to wind hanks of yarn). Payment varies according to the number of colors used in the pattern. A weaver
238 may average 2½ tweeds per week when the work is available,
465 thus earning more than mill workers. A female mill
[542] worker earns about £11 or £12, and her male counterpart about £3 more.

Because weavers are classed as self-employed, they
238 do not qualify for unemployment benefit. They may apply
745 for social security, but must submit to a "means" test,
65 and the possession of bank savings or other assets disqualifies them from receiving such aid. All British workers must pay a weekly sum for "insurance stamps," a certain number of which makes the workers eligible for small payments from the government during periods of illness. Self-employed persons must pay for their own insurance stamps, whereas employers pay for the stamps of their workers. A weaver who does not keep up with his payments of over one pound a week for insurance stamps must pay the accumulated debt at a later time.

471 Weavers face other costs. They buy looms and bobbin-
238 winding machines, and pay for lighting, heating, and the
[238] maintenance of all equipment. The preservation of this
238 anomalous status of "self-employed" is related to the
463 458

238 attempt to preserve the image of Harris Tweed as a
465 cottage industry, and thus maintain its market value.
[438] Many weavers, politicians and businessmen argue that the weaver should be reclassified.

However, the status of weavers as self-employed is not simply bureaucratic jargon designed to preserve
238 the Harris Tweed industry. In most employer-employee
465 situations, people are hired with the understanding that they have certain qualifications and will perform certain jobs. Weavers are not under such expectations and obligations. A mill has little idea of the skill or motivation of the weavers to whom they send their yarn. Weavers differ in matters such as degree of skill and state of health, and they also differ in the amount of time available to weave, and other matters that affect their production. Some weavers refuse to do complex patterns; some are busy with croft work and do not want to do "urgent" tweeds; others who are recovering from illness may prefer not to weave the heavier tweeds. The
[447] tweed van sent out by the mills to make deliveries all over the island meets one such variable situation after another, and thus finds it difficult to meet the demand of the Weavers Union, that tweeds should be equally distributed among all weavers on the island. Theoretically, the mills are supposed to deliver tweeds in strict

000 element, the weaver, is essential to its production.
238 In 1960 weavers receiving tweed yarns from the mills
465 totalled about 1,500 persons, a number which held for
463 about three years and then started dropping at a rate of about 100 a year. In 1971 the number of weavers was less than 1,000, and trends of change appeared to presage a continued dwindling of numbers. It is estimated that emigration increased during 1970-71.
166 Men have returned to the sea, have gone to Glasgow as
464 laborers, or have taken advantage of training courses offered by the Labor Exchange, courses that will eventually remove them from the island setting.

238 The instability of the industry and the fluctuation
571 in amount of weaving work available at any given time
458 has created an environment in which personal ties and individual maneuvering rather than a widespread adherence to impersonal rules such as equal distribution are emphasized. Strategies which involve the mobilization
[608] of kinship and neighborhood ties and involve an emphasis on personal relationships rather than the depersonalization usually associated with industry are made possible by economic factors such as the dependence of decentralized weavers on centralized mills. The watchfulness and consciousness of one's neighbors so characteristic of village life prevail. Questions about the state of

238 the automatic shuttle; all other processes have been
175 built into the design of the Hattersley loom (cf.
402 Thomson 1969). In other words, weaving does not entail
238 very specialized skills and is not difficult to learn.
463 A sailor can come home and learn to weave in a short period of time, or pick up the trade again with ease after having been absent from the loom for a long ti
[671] Neighbors substitute for each other when someone is
[578] ill a tweed is "urgent." Wives help their husbands,
young boys their fathers and uncles. Such low-level specialization and substitutability are complementar
to crofting activities and the maintenance of neighb
hood ties, and may be seen to favor continuance of t
occupation of weaving.

374 The Lewis Castle College in Stornoway, establish
234 as a technical college in 1953 in a building that wa
[467] formerly the home of Sir James Matheson, offers trai
courses in weaving for adults which last for ten wee
and qualify a person for membership in the Weavers
Union (cf. Stornoway Gazette, March 16, 1968). The
[672] college also sends weaving instructors to all the pu
schools on the island to instruct young boys in the
654 rudiments of weaving. The Highlands and Islands
286 Development Board have in the past offered loans and
288 grants with which to purchase looms, and government has protected the mills.

ision of labor. During the summer, she will milk the cows, 231
in the winter she will see that they are fed. If there is 241 593
be a harvest in the autumn, she will care for the crops. 462

Some women, in particular the older ones, plough with 241
caschrom, the foot plough. Other women use a small power 654
even plough or contract with the Department of Agriculture 462
have the ploughing done. The Department will also provide
men and machinery to harrow, cultivate, spread lime and
ure, mow hay, cut and bind oats, dig potatoes, and thresh
in. By utilizing these services, if they can be afforded,
small crofter can free himself or, at least his wife,
n many arduous tasks. The need for cooperation of the family [172]
neighbors is thereby reduced. Although traditional mutual 593
is being replaced by cash payment for labor, it is not the [178]
or of a landless working class which commercialization often
ates, but rather state provided services. Significantly,
t Department employees are newcomers. The Skye man who
ks for the Department is a better worker away from the island.
ce few are able to pay for these services, the wife digs the 241
atoes, and some women use the scythe to reap hay and oats. 462
scythe, it will be remembered is really a man's tool.
quently, the break with tradition is avoided by the return of
on from the mainland or the sea. Running the household and
king the croft is not all some women do. They also take in [185]
mer visitors, by the day or week, and provide teas for travellers.

In summary, it may be said that crofting is anything but 241
easy life with ample rewards. We have seen how meager the

887 arduous is difficult to determine. In the winter of 1953, I
241 helped a small crofter thrash oats, a cooperative enterprise
[123] even with a mechanical thrasher, supplied by the Department of Agriculture. The neighbors who came over to lend a hand were two men and three women. The youngest woman would never see fifty again; her seniors were seventy-seven and seventy-eight. The youngest man, who had just been married, was sixty-three; the other seventy-three. These crofters not only showed more endurance than I did, but put me to shame by carrying the sacks of grain from the field to the byre
[162] at the end of the day. Nevertheless, most of those over seventy, about 15 percent of the population, do not make use
887 of the land for more than growing a few potatoes. An old
231 man cannot keep a cow because, as one man said, "You can't
462 have a cow unless you have a woman to milk it." If he is married or lives with a sister, there may be a cow and a couple of sheep. An old woman may have her cow and sheep if she is strong enough. There comes a time, however, when all the old people will only remember the work involved. Still, they will say, "Och, but they were good for all that."

427 Absentee tenants are responsible for depopulation on
241 the one hand and falling production on the other. A reasonable
161 estimate would be 300. Their number could be as high as 400.
[133] Some townships have over 50 percent of the crofters absentee. The only townships which do not have this problem are the few which contain large crofts. On one small estate there are seventy-six crofts, held by seventy-two crofters. Only thirty

175 Whatever the rationalization, cobbler fathers begot
829 cobbler sons. The present postmaster's grandfather was
463 the first postmaster in Shawbost, and when help is needed
[205] in delivering the mail it is the postmaster's first
[767] cousins who are likely to help out. As late as the 1950's, the township still had its own undertaker, a man who had learned from his father the art of laying out and dressing the body but who didn't like the job very much and was happy enough to turn it over to an undertaker who traveled from Stornoway.

463 The island has had a veterinarian, based in Stornoway,
[232] for the past 30 years or so. Earlier, certain blacksmiths and farmers treated ailing livestock when the crofters
[278] needed them. For human ailments, there were many cures
[155] by plant and spell.

463 The man who was the last village blacksmith died
326 not long ago. His smithy was in the center of the village.
[342] His home and smithy were mortared stone buildings with corrugated iron roofs that were once estate houses for the men who worked the experimental farm established by Sir James Matheson in what is now New Shawbost. The blacksmith was also a shopkeeper and butcher. As a
463 blacksmith, his work was principally shoeing horses and
326 making harrows and peat-cutters, which he did with the
874 aid of one and sometimes two apprentices. One of his

463 One of his
326 apprentices was his sister's son, who built another
[874] smithy not far away. "This was the center of gossip.
[204] People gathered there while he shoed horses that came
[521] from Barvas to Carloway."

444 A number of shops were established in Shawbost
178 that sold clothing, cooking ware and groceries. At
[494] one time they numbered six altogether. These shops also ran the first buses between the village and
[477] Stornoway. Gradually these businesses disappeared
[443] because of competition with larger companies. Mobile grocery vans and butcher shops and bakers began coming in the late 50's, and gradually took over the trade in large parts of the island, undercutting the local busi-
178 nesses. Income from weaving had already weakened self-
434 sufficiency derived from the intensive use of land and
571 sea and also weakened the formerly heavy reliance on
621 local ties and mutual aid. Today an army of town-
44 dwelling entrepreneurs and employees constitute a major
463 proportion of the traffic on the island roads. Grocers,
178 fish dealers, bakers, sellers of soft drinks, garbage
[472] collectors, insurance salesmen, mobile banks, coal
[484] dealers and others extend goods and services from centralized sources to a market which has money to pay for them. The island's participation in this extensive market system is affected by its marginality to the

Appendix B (1), continued.

| | MALES | | |

621 used on different occasions, for example, to discourage
626 deviant behavior or certain marital alliances. Any sign
582 of physical or emotional disability in someone planning to get married invites an attempt by other villagers to
[539] discourage an alliance. According to a Gaelic proverb, "If you want to be praised, die; if you want to be criticized, marry (Ma tha thu airson do mholadh, basaich; ma tha thu airson do chaineadh, pos)." The villagers
621 consider not only the behavior of the person but of his
626 ancestors. The individual is perceived as belonging to
582 a family unit which through many generations has manifested
827 certain physical and behavioral traits. Traits of behavior such as shyness, heavy drinking, stealing and tight-fistedness are interpreted as hereditary traits. "It's in the blood (Tha e anns an t'fhuil)." "It's in the people." Particular occupations are also associated with families.
[463] Stornoway, which is not so "urban" as to have a constant turnover of population, contains many examples of occupations passed down through generations.

632 In Chapter 3 I mentioned the development of several
578 groups in the crofting township which seem to be in conflict with the township as a strongly bounded system. People who keep only sheep have come to blows with those who keep both sheep and cattle; and a distinction between crofters and non-crofters may be seen. Many persons have preferred

651 which official records are kept by the mills. If you
434 say jokingly to a fisherman who has brought in a large catch that he should put some money aside for the income tax man, he is likely to reply, "He'll have to
463 catch me first." A tradesman may be earning large sums
434 of money doing local work as a skilled specialist at
[745] the same time that he is collecting social security. A man may move in and out of a number of different jobs,
[171] and never report his income. "Occupational pluralism" (cf. Brox 1968) rather than economic specialization has developed as a strategy in various countries along the North Atlantic fringe, such as Iceland, the Faroes, northern Norway and Newfoundland, as well as the west coast and islands of Scotland. In these marginal areas, income from specialized occupations is, in the long run, unpredictable and inconsistent.

178 In times of national economic depression, strikes,
458 shifts between socialist and conservative governments,
241 and other crises, crofting provides an alternative
175 strategy. During the last war, many islanders who had
722 left the island (including some who had been quite
166 prosperous in the cities) returned to spend the duration of the war in the village, glad of the relative security provided by the relative abundance of food and less strict
000 rationing. During a huge snow-fall that occurred on

105 The Harris Tweed industry is lauded as an
241 industry which is compatible with crofting. Because
288
632 weavers are self-employed, they can set their own schedul
of work and thus continue to participate in croft work
and fulfill various township obligations. The effects
[121] of this industry on the township as a social boundary
[434] system were investigated. The income available from
• [463] weaving is unpredictable, which encourages the retention
of crofting practices and other patterns of behavior,
such as "occupational pluralism," that were found to be
[476] adaptive in the past. Such strategies also strengthen
[082] township boundaries; for example, they encourage mutual
[434] aid and communal township practices. But weaving also
[407] offers a high level of income; and some weavers, preferrin
to spend most of their time weaving, have neglected
crofting, or have invested in tractors or other motorized
transport which enables them to harvest crops, cut peat
and perform other activities independent of other township
members.

105 The fundamentalist Free Church constitutes an important
621 boundary-maintaining mechanism, serving to exclude various
795
632 external influences of the larger society from the township.
184 However, a smaller network of persons engaged in the
105 religious sphere of social activity, a subsystem within
794
621 the township system, also exists which has the appearance
632 of a firmly bounded system. These are members of the clique
184

2 ECOLOGY AND PHYSICAL ENVIRONMENT

361 THE population of the island huddles round the coastline
133 as round a central heath. This is mainly because the inland parts of the island are either barren, as in Harris, or infertile bog, as in Lewis. Much of the south Hebrides has, on the west coast, the extremely fertile machar land, but Harris and Lewis do not have these useful patches. The machar land is land built on shell sand and dressed with fertilizing seaweed; it forms a fertile fringe, no more than a belt of varying width between the sea and the acid peat bog on the inland side. Where this land does occur, mainly on the west coast of the island, townships crowd round it for the good growing it can give. The other reason for the
[262] attraction of the coast is the obvious one: the close proximity, on the doorstep, of a change of diet, shellfish and inshore fish such as whiting, cod, haddock and mackerel. The exceptions to this coastal grouping are Achmore, Cliascro, and Lochganvich in Lewis.

133 There is a great physiographical difference between the east and west coasts of the island, this apart from the incidence of macharland on the west coast. The eastern side is steeper to the sea; though sheer cliffs occur at Gallan Head, West Loch Roag. The south-western coastline has high, almost sheer cliffs with few inlets or sheltered harbourages excepting Loch Roag, a magnificent inlet, sheltered at its farthest inland penetration by Great Bernera. The coast on this island side often presents rocky teeth to the Atlantic's buffeting; and often suddenly falls down to sea level to display wide stretches of sand. Uig Bay, where the Red
• [463] River runs into the sea, is a breath-taking sweep of whiteness. The eastern coast is generally rocky but has more inlets, lochs which carry townships mainly engaged in fishing or tweed manufacture.

AGRICULTURE AND FISHING

228 and its neighbourhood becoming the centre of the growing in-
*175 dustry. In 1793, the Lewis Parish contributors to the *Old Statistical Account of Scotland* indicated that upwards of 183 boats were
• [463] fishing off the island. In Uig no less than 275 netmakers were
[286] recorded, showing that the fishing industry was prosecuted with some measure of enthusiasm. 'All the people dwell in little farmvillages and they fish in the summer season. The women do not
[462] fish; but almost at all times when there is occasion to go to sea, they never decline that service, and row powerfully.' In the parish
[237] of Barvas in the eighteenth century some 9,000 Scotch pints of oil were taken each year from dog-fish livers and sold to Stornoway merchants at from 6d to 8d per pint; it is related that the tenants of Ness were able for a long time to pay their rents with
[433] the oil proceeds. Cod and ling were the principal fish caught by the men of Lochs, an annual average of 24 tons being cured and sold in Stornoway. Generally, other fish caught were consumed locally.

Loch Roag on the west of Lewis proved to be about the best fishing ground; in 1794 about '90 sail' from all parts of the United Kingdom were at the herring fishing there. At one time Loch
228 Roag-cured herring was exported exclusively to Sweden. The
*175 minister of Stornoway, contributing to the *Old Statistical*
439 *Account*, gives figures showing the quantities of fish shipped from the port from 1791 to 1796. During these six years some 14,000 barrels of herring were exported to the Continent, and 20,000 sent for consumption in Britain; some 350 tons of cod and ling were destined for Continental markets. Herring, cod, and ling were thus pursued during the following years with growing vigour, though the inshore white fish took favour. The herring fishing did not make great strides, mainly because to the middle of the nineteenth century catches were confined to the inland sea lochs; the people for the most part were not familiar with deep-sea fishing, and their boats and nets were not suitable for it.

Indeed, when Sir James Matheson bought Lewis in 1844, he
228 gave scant attention to the potential in the fishings round his
*175 island. Though he expended considerable amounts in securing a
[504] regular steamer communication between the mainland and the island, and spent over £2,000 in building a quay at Stornoway

6 TRADE AND INDUSTRY

IN the earliest times, the folk of the island of Harris and Lewis 175*
were self-supporting; all that they needed for life as it was 511
lived in those days was available at near hand; their existence was self-contained, the economy virtually self-sufficient. By and
[439] large, the only commodities often imported were salt, iron, and
[427] to a certain extent, wood. Rents were paid largely in kind: the
[434] produce of agriculture, fishing and labour. Surplus produce was directed to southern markets to bring in the odd shilling or two for which there was really very little need in the island. But once
[436] money became important in the national economy, it was not long before it was required in the island economy too. By 1790, if not well before, two or three open boats set out each year from Uig to Glasgow, laden with salt beef and dried salt fish. At about this 175*
time, too, changes were making their slow appearance in the island 108
way of life and living. Specialists were being required: smiths 511
tinkers, shipwrights, netmakers, boatbuilders, weavers, tailors and 463 •
millers. Each of these craftsmen generally held some cornland, either individually or in shares, and also had some rights in the common ground of the township in which he lived.

CROFTER INDUSTRIES

From the pure crofter class there emerged the crofter-craftsmen. 175*
In Lochs, for instance, by the turn of the seventeenth century 80 463
per cent were registered as fishers and netmakers. In the west, in the parish of Barvas, some 70 per cent were also fishers, with kelp-
[427] making as a seasonal occupation. In Stornoway parish, where sub-
[434] tenants paid 30s to 60s in rent, with twelve days' service, they sold ling to their tacksmen at 5d each, earned 20s a month on herring boats, made kelp at 30s a ton, and worked on roads for 8d per day.

In Harris in 1895, the eight trained male weavers worked for 286
the gentry only. Weaving for the populace was done by the 462
175*
433

TRADE AND INDUSTRY

288 Thus were laid the lines of a new form of economic organisa-
*175 tion for Lewis. At first, tweed manufacture here, as in Harris, was
[462] strictly a domestic activity: the wool of the crofter's own sheep was clipped, washed and dyed, carded, spun at home, and woven into cloth by persons in the township with the skill to produce a suitable cloth; the weaving was a part-time and mainly female occupation. Payment for the weaving was in kind: peats, potatoes, or labour. The waulking or finishing of the cloth was mostly a communal activity carried out by the womenfolk, who turned it into a particular social occasion with definite feminine characteristics. If the cloth made was in excess of domestic requirements, the crofter sold it directly to a customer, or else the local shopkeeper bought it or gave credit for it.

With the rise in weaving for a definite market in Lewis, all this 288
• changed. Weaving became a full-time specialist occupation and, 463
*175 partly because the flying shuttle made the work heavier, it be-
[462] came predominantly male work. With the use of mill-spun yarn there grew up a number of merchants, the Lewis 'producers', who 288
*175 bought yarn either locally or from the mainland, and put it out
[441] for weaving and hand finishing on a commission basis. The yarn and the resulting cloth remained their property. At times the cloth embodied a handspun weft; at other times perhaps no handspun was used at all. As pointed out above, it was marketed as Harris Tweed, as was the 100 per cent handspun cloth, yet it cost about 21d to produce compared with 36d for the 'real' tweed. The cheaper type provided Lewis's rapidly-expanding output between 1900 and 1911, and by that year Lewis had outstripped Harris. In 1912, the handspun yardage produced in
[433] Harris was 175,000; partially and wholly millspun accounted for some 4,000 yards; and the total value was £26,500. In Lewis the yardage of handspun cloth was some 10,000; but about 340,000
[435] yards of partially or wholly millspun was sold. The total Lewis value was £44,000.

288 *The trade mark*
441 When eventually the question arose of some mark to distinguish
*175 between the two cloths, it was with difficulty that the Harris mer-
424 chants persuaded the Board of Trade that a distinction was neces-

PRESENT INDUSTRY

of a knitting industry based on the crofters, who would use Lewis 286
yarn and produce knitwear in addition to their woven fabrics. 175*
However, it was found that the yarns used for Harris Tweed were unsuitable for knitwear, not being given sufficient twist in the spinning: before women use this tweed yarn for knitting, it is common practice to twist two or more threads of yarn together on a hand spinning-wheel.

Little in the way of craft work is done on the island, mainly 463 •
because of the lack of indigenous materials which could be used to produce typically-island items. Marram-grass has been sug-
[397] gested as being suitable for making agricultural wind-breaks, and
[735] close-woven basket-work. Shore-stones and pebbles are plentiful both in quantity and variety of type and colour.

Small employment outlets on the island are marine and motor 396
engineering, mainly based on Stornoway, and boat-building. This
[464] latter is a small but socially-significant firm in Ness with products with a high reputation. Construction and general building is of some significance, one of the most enterprising firms being built up literally from scratch so as to become a highly-successful island business.

The unemployment problem

The island's unemployment problem is as much a matter of 464
concern today as it has ever been, averaging about 25 per cent annually (representing well over 1,000 people) compared with the Scottish mainland figure of 6.0 per cent; the contemporary figure for Britain is around 3.0 per cent. While unemployment as it 464
affects adults is serious enough, unemployment among teenagers 883
threatens the community's whole future. The island has its Youth Employment Officer, who has an unenviable task. Each junior and secondary school in the island is visited to interview school-leavers, at least once a year; employment advice is given and this is supplemented by Careers Officers' visits.

Such employment openings as exist over the island's limited spectrum are concentrated in Stornoway. They are, however, mainly in shop work, mill work and hotel work for girls, with a
[462] few vacancies for apprentices in trades generally associated with building construction. Most of the jobs offered are very much in

A HARRIS VIGNETTE

621 has direct or indirect communication with Glasgow, Stornoway
63 and North Uist. In summer a thrice-daily bus runs to Stornoway,
[505] and once a day a bus makes the round trip of East and West
[494] Harris. The township, linear in pattern, east to west, includes six-
[361] teen shops which cater for most of the needs of the population
[366] within reasonable travelling distance; it also has two cafés, a post office, a licensed hotel, a hall for social functions, a
[868] masonic hall and two churches. The Sir E. Scott School here is
[873] the only secondary school in Harris with an academic stream. Most of the working population is employed in the service industries, the professions and the tweed industry. Tarbert was a
[504] fishing port of some significance in the past, and is now a refuelling point for ships.

144 The absence of organised industry on a large scale, such as
[167] Lewis has, is a factor which tends to bring nearer to reality any desire on the part of Harris natives to leave their native soil. There are small pockets of industry, but these are only dabs of easing
• 463 ointment on the excessive unemployment sore of 27 per cent. The
[641] main occupation is of course crofting, the income from it being
[439] augmented from a variety of sources. Some crofters concentrate
[786] on the production of Harris Tweed, perhaps using the wool from
[388] their own sheep; the natural dyes from the lichens which grow on the rocks and from other plants are still used occasionally. Others specialise in knitwear. Recently shell-craft and wood-turning have been added to the traditional crafts, with a view to the
[220] tourist market. Fishing, of course, plays a part in the economy in some communities. The interest of such organisations as the Scottish Country Industries Development Trust has been concentrated on the potential in shell-fish processing, and the production of knitwear on a larger scale than exists at present. Road-
[464] work gives employment to about thirty men, but is of course seasonal.

316 An apparently bright light on the employment horizon showed itself in 1965, with the opening of a quarry at Lingerbay. The mineral quarried was anorthosite, a white granite used as an abrasive in cleaning products. A 99-year lease was taken out by a subsidiary company of William Robertson (Shipowners) Limited, Glasgow. But the quarry was closed in 1967 due to lack of orders.

195 even to the extent that the St Kildans used their observations of
18' the flights of birds both as compass and as omen for good or evil.
[828] Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naively at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started,
[296] HMS *Flirt* sailed from Greenock with food to relieve hardship
[931] among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island con-
[262] sisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from
[272] March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond
[342] of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the
[392] Western Isles'. All were well furnished, peat was used for fuel and
[405] there were two watches and one clock on the island. There were
[162] some seventy-five islanders; most of the men were old, and only two of them were unmarried, with twelve spinsters still to choose
[212] from. All read the Gaelic Bible. The men were mostly tailors, shoe-
[463] makers and weavers; every house had a loom. They made all their own clothing, the men also making the women's dresses,
[214] and a good deal of blanketing and tweed cloth was made and
[286] sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each
[462] croft and house was rented at £2 annually, sheep being charged
[429] for at the rate of 9d per head; these charges were usually paid in kind.

439 Feathers of the sea fowl formed the principal export of the
435 island. The factor paid 6s per stone of 24 lb for black feathers;
[237] and 5s per stone for grey. For these he received, in Edinburgh or

121 by help of oral tradition and of the living witness of con-
170 tinuing usage, we can reconstitute Gaelic life from the
176 view-points of both people and chief. Elsewhere, even in Scotland, only fragments of early life are recorded, in
175 parchments written by the lawyers of landlord and king,
814 and almost always from the privileged side. History is
127 indebted to modern lawyers who have deciphered and published the faded documents of their predecessors. But the very training as solicitor-factors which fitted them for this specialised task, in no way prepared them to view life as seen, experienced and felt by the men and women of the past, or even by the elders or youth of the townships today, with whom they have rarely laboured and whose mother tongue they rarely understand.

(a) THE LABOURS OF MAN AND WIFE, AND THE REWARD

62 We have seen that until the nineteenth century the
632 township in the main was self-contained. Its people grew
175 reared or caught their food, and also found the raw materials
[833] for their clothing; they built their own shelter, and cut their own firing. As a result, both men and women had
174 each to develop "a wide range of simple skills", in the
175 apt phrase of a Lewisman, Mr. Donald MacLean, M.A.
462 Beyond the co-operative effort within a family, a farm group, or a body of 'fellow-townsmen'—in which each was competent to take a share according to sex and age—aptitude and family tradition initiated some local division
• [463] of labour. The resident smith and the 'caird' (usually a wandering craftsman or tinker) appear in the oldest tales and in the first rent-rolls. In addition there were honorary
[759] tasks. The smith might act as the village surgeon, ready

174 to bleed or to set bones, while some elderly woman would
175 serve as physician and midwife. Spiritual consolation
433 and renewal too could be found, even in the absence of
462 monk or nun, or of priest, minister or catechist. Enough
• [463] here, that with agriculture and fishing, most crafts, except
[759] metal-work, were practised in every family. The 'range
793 of skills' was therefore wider and richer in latent art than
[593] might be supposed from those needed on a little croft today. Hence the importance of understanding the roles of husbandman and housewife, of "the man and the woman of the house".

194 Their labours through the annual rhythm of the seasons
462 might be classed as efforts for the man and endurance for
221 the women (Fig. 9). Man's muscular strength and free-
[181] dom of limb rouse him to efforts demanded by the thrust and lift of peat-cutting, digging in stony soil, or pushing the foot-plough, step by step obliquely down a rocky slope. In the past an archer's chase of stag, wolf or boar demanded all a man's effort, and courage too, as fishing still does in the stormy north-western seas. With this facing of danger there came a gaiety that sparkled like the crest of a breaking wave. Women's work demanded by its unceasing activity a cheerful endurance, whether at labour on the croft, at corn-grinding, butter-making and peat-carrying, or carding, spinning and weaving; and with every task of day or season came the constant tending of cattle, of menfolk and children.

[538] This allotment of seasonal tasks and skills is neatly put in the proverb, "A man's cow won't yield milk, nor a woman's horse ploughing" (*Cha bhi bainn' aig bo fir, 's cha bhi treabhadh 'an each mnatha*). Yet women have always taken a share of work on the croft—too heavy a share when the men were much away—and the habit of

175 as some Indian pedlar one meets on the road may seem
433 now. An older packman's tale of his long tramps, of the
[326] people's poverty and hospitality, must have resembled
[443] the mingled plaints and praise one hears from an Indian pedlar today! But in the past only a speaker of Gaelic
[191] could find his way among the people. Almost until 1900,
if not still later, Gaelic speech was to prove a social bond,
[197] but ignorance of English speech an economic barrier.

The transition to increased exchange, with migration,
175 permanent and temporary, tended to make for specialisa-
433 tion. About 1795, *Statistical Accounts* enumerated, for
• 463 every hundred families, two or three smiths, wrights (or carpenters), a shipwright or some boat-makers, a few
[198] weavers, tailors, and perhaps a miller. Each of these held some corn land, individually or in shares, with rights on the common. The line between plain crofters (to use a later term) and crofter-craftsmen was not easily drawn, and different writers wrote as they judged best. In Lochs, 80 per cent were fishers and net-makers. On the open shores of the west, in Barvas parish (in which three-fourths of the men were also 'fishers'), kelp-making was a seasonal
[421] occupation. In Stornoway parish, where sub-tenants paid 30s. to 60s. in rent, with twelve days' service, they sold ling to their tacksmen at 5d. each, earned £1 a month on herring boats, made kelp at 30s. per ton, and roads at 8d. a day.

175 In Harris in 1795 the eight 'bred' (or trained male)
286 weavers worked only for 'the gentry': the laird, the
462 tacksmen and their families. The rest of the weaving was done by the women, giving a ratio of only one male weaver to fifty-five families. But in Lewis male weavers were commoner—one to every twenty to thirty families was the ratio—as if the practice of home weaving by the women was less universal there, even at that date.

APPENDIX II

RECENT STATISTICS (1953–54)

128 In brieffer form, the basic economic data can now be reviewed,
433 in the same order, for 1953, or the period April 1953 to March
1954, as available. The results are shown on the second pair
434 of Tables, pp. 318–319.

(i) *Tweed Industry* (1953–54)

434 Taking 5,000,000 yards as the 1953–54 total, and accepting
an estimate of 1s. 2d. paid to weavers per finished, mill-shrunk
288 yards, payments to weavers in Lewis-and-Harris (and a few
• 463 of the southern Hebrides) would amount to some £491,700. After subtracting the output from Harris, this corresponds to an informal estimate by the Lewis Association for Lewis proper of well over £250,000 and more, probably £275,000 for the period. Adding the wages of spinners in Stornoway mills, and also of carriers, dockers, etc., it is thought safe to double the figure, with £550,000, for Lewis, rural and urban. Most of the weaving is rural. The increased use of daily bus transport allows rural dwellers to come to Stornoway daily to earn and so has increased the ratio of rural to urban wages by spinning and other labour. For rural carriers and mill-employees, a fifth of £275,000 is taken here, making £55,000. As no estimate for the 'net earnings' in Lewis is available, the same ratio to wages is taken as in 1938, making £1,200,000.

(ii) *Agriculture, Peat-making and House Building* (1953)

178 (a) *Agriculture.*—First, the trend of crop and stock pro-
431 duction can be indicated by selected figures for the Island for
1918, 1939 and 1953. The areas both of oats and rotation
241 grass increased, the three successive totals in acres being, for oats: 4,460, 5020, 5440; and for rotation grass: 390, 1385,

23 change in area, then the amount of stock allowed, per pound sterling of rent, ought to be
427 changed, too.
654
175 This does not appear to have been done in Uig although in Harmonry parish the 300
per pound was increased after rents were reduced in the late nineteenth century. More
recently, the Crofters Commission, in re-stating sommings for some townships, has
generally (but not invariably) applied the sommings to the 1886 rent, regardless of the wording
of the 1912 regulations. This may appear to have the merit of consistency and, insofar as
crofters pay any attention to the Regulations, it satisfies them because the greater (1886)
rent gives them a larger summ and less likelihood of being criticised or penalised for
overstocking. However, it perpetuates inconsistencies which originated during the nine-
teenth century when the stock allowed per pound sterling rent was not reduced although
total rentals were increasing as squatters' and cottars' holdings were added (see page
above). Moreover, the old summing referred to the old type of Highland cattle which were
much smaller beasts than those kept today, and it assumed that the shieling pastures were
to be full use. A further complication arises because about 1920 some townships acquire
substantial enlargements but the sommings do not appear to have been adjusted. Altogether
it is little wonder that the Grazing Regulations are seldom observed, for they seldom bear
any close relationship to the grazing capacity of township lands. Proper observance of
carefully revised Regulations, in which unlimited substitution of sheep in place of cattle
was specifically forbidden, would be of considerable benefit to the crofters.

24 The inbye, or croft, land is invariably separated from the common pasture by a ring
253 fence, the gates of which are generally closed for protection of crops from May to
September. Progressive townships are installing grids to obviate the twin nuisance of
713 traffic interference and straying stock. The fencing of individual crofts was rare until the
• [28] 1930's and is still by no means general. The inbye land is, in many townships, the best
winter grazing and its division into innumerable tiny fenced patches, whilst advantageous
for cultivation, would restrict the movement of stock in search of water and shelter; in a
predominantly pastoral economy complete enclosure of individual holdings is not
[198] necessarily an advantage. This problem will be discussed in Part III but, in the present
context, it is relevant to point out that the small crofts of Lewis contrast strongly with
the larger ones of, for example, the Isles and Tiree. Therefore, what may be
advantageous in the latter may be retrograde in much of Lewis.

The lay-out of the crofts aggravates this problem. The long narrow strips of the 1850
lotting, well-suited to spade cultivation and common winter grazing, may require four or
five times the length of fencing required by an equi-dimensional croft of similar area. If
fenced the stock may be deprived of both water and shelter; since arable cultivation has
become relatively unimportant a suitable solution to this problem might be to fence a small
potato plot near the house and to put the rest of the inbye down to sown grass in strips or
four contoured parts in which grazing could be properly controlled. A particular problem
is posed by crofts which have been sub-divided. These may take the form of strips as much
as half a mile long by 10 yards wide or, more commonly (and much worse), of piece-meal
sharing of innumerable plots, a system known locally, but incorrectly, as 'run-rig'. This
is seen at its height in Knasp (fig 22), where every croft in the township is affected. The
problem does not arise in townships with large crofts, which are usually more nearly
equi-dimensional. These are mostly the result of re-settlement schemes and have long
been fenced, (see, for example, figure 15).

Crofter-tenants.

462 An analysis of crofter-tenants according to age, sex and occupation (table 12) provides
427 several important clues as to the present unsatisfactory state of crofting. More than
463 one-third of the tenants are over 65 years of age; a further 16% are absent, some of these
may also be over 65, others are younger people working away from home, a few are tenants

Despite these aids and incentives, parents do not encourage their children to weave. The weavers themselves describe the job as dull, offering no security and no possibilities for advancement.

Referring to her young son, a mother says, "By the time he's old enough to weave, the tweeds will have failed." Another mother says, "I want him to learn some trade, if he's intelligent enough. I don't want him to stay here. The tweed is so uncertain." "There's no future in it," says the father of another young boy, "I definitely wouldn't want him to be a weaver. It would be good if he went in for engineering."

The histories of the weavers reveal many examples of shifting occupations. Weaving often alternates with work in the local mill, which is also relatively unspecialized. The Shawbost mill must tolerate this unstable labor force, as labor is difficult to find. Eldest sons tend to leave the island for more stable, permanent jobs, leaving the croft and the loom to their younger siblings. Table V[1] shows the number of male weavers in each age group.

The fact that Shawbost has the same age structure as the rest of rural Lewis (see Table II)[2] and less unemployment signifies that weaving has not served as an adequate incentive to keep young people on the island.

1. [See p. xi--Analyst]
2. [See p.xiii--Analyst]

like to leave the loom for the time it took to look after the sheep."

A fourth household consists of three unmarried siblings in their 40's and 50's who recently sold their cattle and now keep only sheep for their own consumption. They cultivate a small amount of oats and hay to feed the sheep during the winter. The brother who was largely responsible for taking care of the livestock is now "concentrating on the loom," and his brother works in the mill. Their sister, who used to work in hotels on the mainland, now keeps house for them. Described as a "self-contained family," they have a tractor and a deep-freeze and take care of their peat and the harvesting of crops by themselves. One of their crofts has become too waterlogged even for grazing and was sold recently to the son of a local crofter, not for agriculture but as a prerequisite for applying to the Department of Agriculture for a housing grant. Only tenants of crofts can apply for such grants. As this particular croft is too wet to be cultivated or used as a house site, the only motive which the new tenant has to become a crofter is to gain access to governmental subsidy.

The fifth household is composed of a retired couple and their son and his wife and family. They have no cattle, and use the crofts for grazing sheep.

28 There is no hotel in Carloway; the Department of Agriculture hail from Calanais is borrowed; teachers have their meals either from the Admiral at the Lodge or from Stornoway whence a dairy delivers daily.

233 Eight crofters keep sheep, cattle vary between 5 and 30 per holding. Two crofters keep pigs (one of pedigree). With a total of only 116 sheep and lambs on 1959 access common pasture there is no danger of over-grazing.

The village has a good water supply from Loch Mhurchaidh, and has had electricity since 1955. There are excellent communications. A buses a day to Stornoway and Tarbert, and a bus from Uig and one from Berneray passing through Carloway. The village has been a popular place for the development of crofting industries, and the good communications have probably contributed to the decline of crofting interest in crofting.

463 There are only three crofters (two of whom draw war pensions). Of the remaining two both are full-time crofters (two of whom draw war pensions). Of the remaining two both are permanently resident, 10 have regular or part time employment in Stornoway (one being a crofter) and one is employed in Carloway at the Lodge. Only two people do part time weaving. Crofting is very much a sideline. There is no indication of renewed interest in the land, instead, life is becoming increasingly orientated towards Stornoway.

CALLANISH by Anne Ireland and Jennifer Cornbury

172 Callanish must be one of the original settlement sites of the Hebrides, as it boasts an impressive standing stone circle and two other groups of stones. The promontory rises to about 180 m on a promontory, which projects into East Loch Roag. The promontory rises to about 135 ft, and then the land drops to sea level at the neck (less than half a mile wide) which joins the promontory to the mainland. The township extends inland for about 1½ miles from the promontory to the middle of the mainland. The township extends inland for about 1½ miles from the promontory to the middle of the mainland. This island area forms the crofting township of Callanish. It is a rough hummocky moorland with the general height rising gradually inland, the highest point is 425 ft.

195 The early crofts were situated close to the stone circle overlooking the promontory and sea, and were in crofters who had been cleared from Linshader and Ceannabeg in the eighteenth century. It is said that until the Crofter's Act the Callanish crofters had to return to Linshader and Ceannabeg for one day's work in return for the use of land. But later the crofts on the promontory were cleared and replaced by the more exposed westward lots. The promontory were cleared and replaced by the more exposed westward lots. The ruins of the croft houses still remain. The crofters were given the new lots next to the main road from Stornoway to Breasclete, which gave them the new lots next to the main road from Stornoway to Breasclete, which gave them the boundary between the crofting and the moorland. Fertilizer and manure are very expensive and difficult to obtain, and the soil is very poor, consisting of various in quality, but it is mainly sandy and peaty. Much of the land is very rocky and stony. The soil is mainly sandy and peaty. The soil has been sub-balanced by the lower part of the soil. The soil has been sub-balanced by the lower part of the soil. The soil has been sub-balanced by the lower part of the soil

TABLE V

OCCUPATIONS OF MALES (15-64) RELATED TO CROFT SIZE

Size of Operative unit (acres)	Full time croft work	Croft work with Regular employment	Croft work with periodic employment	Total[1]
0 - 5	14(30)	27(59)	5(11)	46(100)
5 - 10	19(42)	22(49)	4(9)	45(100)
10 - 15	14(50)	10(35)	2(7)	28(100)
over 15	7(56)	3(23)	3(23)	13(100)
Total	54(41)	62(48)	14(11)	132(100)

1. It is not possible to relate occupations to size of operative unit in every case as many units are in fact run by more than one person - such units have been omitted from the table.

/p. 8-8/

291 Table III reveals that there are 117 agricultural units with a crofting; ten units are crofts in Glengarnoch without a crofting and the remainder of the 219 units have no grazing rights. From this Table, it is clear that full stocking and overstocking increase with the size of the croft: the units of ten acres and over, on the basis of stock carry, would appear to be the most intensively worked. In all, just over half of the units take up their full crofting.

292 Reference to employment ancillary to croft work for 141 of the 219 units and it would appear that neither ancillary employment nor age is significantly related to the intensity of croft working.

293 Table V points to the fact that more full-time crofters are to be found on the larger units but that less than one in four of the younger and more active men are full-time crofters. Tables III, IV and V underline the fact that the larger units are also the more successful and it is significant that the larger units are almost all on the better land in the agricultural township. The average size of holding in the agricultural township is nine acres, compared with less than eight acres in the fishing township, where the land is much poorer and the cultivable area much more restricted.

295 The trends in agriculture are illustrated by Tables VI and VII. The Crofters' Commission made a survey of the crofts through the medium of Estate Factors in 1883. From Table VI it is evident that the number of cattle was much higher at that time and that the cattle-sheep ratio in the

296 297 extended township was 1:3 as compared with 1:25 in 1958. Table VII gives agricultural statistics for the parish of Lochs as a whole, separate figures for Park are not available. Since 1913, radical changes in the crop and stock patterns have taken place; here (Hordeum vulgare) has disappeared as a crop, and sown grass and permanent grass for hay have since 1947 become the leading crops. Horses have all but disappeared, and the cattle-sheep ratio has risen from one to then 1:4 to 1:39 for the whole parish. Since 1938, cultivation in Lochs Parish has declined by 36 per cent. Large areas of lazy-beds, no longer cultivated, lie visible landscape signs of these changes; seaweed, the sine qua non for lazybed cultivation, is no longer carried to the upper parts

298 of the crofts. In fact, many of the crofts no longer use seaweed as a fertiliser.

299 From the foregoing account, it is clear that there are two major agricultural problems in Park; 300 the lack of sufficiently large crofts with good arable land and an insufficiency of common grazing; these deficiencies bring in their train the problem of overstocking, and the existence of uneconomic buildings.

301 The more progressive crofters, significantly resident on the better crofts of the agricultural 302 township, have shown how croft land can be improved by re-seeding and sowing down to grass; 303 practices which could be fruitfully extended throughout Park. In addition, several townships by co-304 operative effort, have reseeded small areas of the common grazings with splendid results.

305 However it is clear that it is not possible for 219 stable agricultural units to be maintained on the present crofting area. The optimum size of croft which could maintain a family is a moot point, for the location and situation of a croft and the quality of the land and common pasture would all have to be taken into account in making an assessment.

306 This problem was referred to a practical agriculturalist who was asked to state what size of 307 croft and number of stock would be required to provide an annual income of £350, excluding croft 308 benefit (milk, eggs and potatoes consumed on the croft) and any costing for labour. To fulfil these conditions, one of the fishing townships was carefully analysed, and the expert came to the following approximations, assuming that the rules of good husbandry were in force after the croft had been brought up to a good standard of cultivation and re-seeding had been carried out where possible on the ostrus and Common Pasture, and provided there was no overstocking, and that present favourable subsidies and prices continue:-

1. Principal workers of crofts: most women take some part in the working of crofts, planting potatoes, lapboning and harvest work, peat cutting, etc.

/p. 10-1/

166 However, not all such
167 employment is available in Park; 47 percent of the innumerable male population
444 leave the Hebrides to find employment, one third take seasonal employment, and two-thirds permanent employment forth of Park (See Table VIII).

Employment within Park

298 Table IX shows that opportunities for local employment are strictly limited. Weaving of
444 Harris tweed is the most important single source of employment. It is significant that those engaging in it are almost all crofters working in their abundant spare time. Weaving is an ideal adjunct to croft work as it is unaffected by weather or hours of daylight and thus can be performed during periods of agricultural inactivity. The vagaries of the Harris tweed market make the occupation precarious. Park is one of the more inaccessible areas of Lewis and the mills are apt to give their commissions to the weavers nearer at hand around Stornoway when work is scarce. Since 1952, the number of weavers in the fishing township of Cromore, Marvig, Calbost and Grantr has grown from 11 to 22 and much of the credit for this is due to the activities of the Pairc Association. Fishing, on the other hand, has lost ground in the same period: the number of fishermen has declined in these townships from 20 to 14[1]. Apart from
298 weaving, service occupations form the only other employment available, shop-keeping, driving,
444 and road maintenance being the chief occupations in the service group. There are very few craftsmen; with such a small population, not the long apprenticed traditional craftsmen, but builds his house and in his own tradesman, there is little opportunity for a trained builder, joiner or even shoemaker to make a livelihood. The professional class is small and entirely composed of the minister and missionaries, the doctor and several schoolmasters.

462 There is little opportunity for women to find employment in Park, apart from nursing, shop-keeping and school teaching, and a few domestic service posts (See Table IX)

Employment forth of Park

166 The persons in the 15-44 age group form the main body of those working away from home.
444 The distinction made between 'seasonally away' and 'regularly away' is that the former group spend part of the year elsewhere, the men on whalers in South Georgia or with the Tay Salmon
462 Fisheries at Perth, or labouring on the mainland. The women are in domestic service, mainly
465 in hotels. A majority of the men in the latter category are in the Merchant Navy; in some cases
444 these men take leave to coincide with the spring work and the harvest. The majority of the women are in domestic service (See Tables IX and XI).

An interesting comparison is the 'regularly away' group exists between men and women in the professional classes (Tables IX and XI). The sample is small, but it is clear that more women than men attain professional status. The number of domestic servants, nurses, and merchant seamen is a reminder that the crofting districts provide a pool of labour for certain vital occupations, some none too popular in Britain as a whole. In people alone, one can say that Park makes a distinct contribution to the fabric of the national economy and this contribution is much more apparent outside Park than within the district. At the same time a majority of those who are temporarily or permanently away eventually marry and settle outside the district and thus a most valuable section of the community is constantly moving southwards. Only 35 per cent of the men in the 15-44 age group are wholly resident in Park, and 46 per cent of the women in the same age group, a reflection of the poor prospects and utter inadequacy of resources on the most of the crofts.

1 The 1952 figures are abstracted from the Lewis Survey Report on part of South Lochs.

CONTINUED ON NEXT FICHE

crofts in other districts, despite the legal requirement that a tenant shall reside within o miles of his croft. Thus half the crofts in the parish are tenated by persons who nnot be expected to make the best use of them. This implies no criticism of the people oncerned, it is a criticism of the system. Of 314 resident tenants under 65 years of ge, 43 are women; of the men, 170 have regular employment including fishing or weaving, 5 take casual or seasonal work as and when they can get it. Only 46, or 7% of all tenants, re "full-time crofters" and, in fact, most of these are either invalids, disabled, or over 0 years of age. Thus in Uig, unlike the southern Outer Hebrides, most crofts are at est a spare time occupation, at worst merely a house site carying special privileges. he table also demonstrates that the size of crofts has little bearing on occupational atus; this is inevitable in a rigid system under which a man has no control of varying e size of his holding according to his needs. Some young tenants inherit crofts far too nall for their family needs, whilst many elderly tenants, and women, have crofts which re too large for them to maintain.

It is not surprising, then, that many tenants do not wish, or are not able, properly cultivate or stock their crofts. A few, however, are particularly interested in gricultural production as a means of livelihood. Some of these have acquired extra rofts, and so built up much larger units. This may be done by acquiring tenancies either the crofter's own name or that of his wife or a close relative, or by sub-letting. About 0 crofters in Uig are tenants of more than one holding, at least 20 work holdings held in e name of close relatives, and at least 120 have sub-let holdings. These figures are rtainly too low: sub-letting without the consent of the proprietor or Crofters Commission illegal. Nevertheless it is common, and it is generally unsatisfactory because the sub-nant has no security of tenure and no right to compensation for improvements; con-equently sub-let crofts are often neglected and sometimes over-grazed as well. Controlled ub-letting, for a stated minimum period and with the right to compensation, would egularise a well established practice and encourage the formation of larger units, better ble to support a family.

A converse of sub-letting is unofficial sub-division. There are a few cases of cottars - ually relatives living in a second dwelling house on the croft - sharing the croft with the nant; but this formerly widespread practice has all but disappeared. Such de facto rofters" share the common grazings, as do "squatters" - persons with houses on the ommon land - who keep stock. Thus neither the number of crofter-holdings on the rental 99), nor that of crofter-tenants (663), is any guide to the effective number of potential gricultural units. Of the crofter-tenants, 100 are absent and some of those who are esident sub-let their crofts. After making these allowances the number of de facto oldings becomes 518; to these must be added 39 cottars, squatters and others (including few tenants of council houses) who keep at least a cow or five sheep, and 23 agricultural oldings without crofter status. Thus there are 580 potential agricultural units in Uig.

That is not all. Of these 66 have no cattle, and 162 carry less than half their soum, which 22 have no stock at all. Little more than 400 holdings can reasonably be said to agriculturally effective. This is an indictment, not of the crofters, but of the gricultural structure of the system. This neither provides viable holdings nor does it nable those who wish to acquire enough land to be agriculturalists to get it, even though uch land lies unused or ill-used. In short, the system is too rigid. In consequence, e-population goes on apace whilst potential resources are neglected. Three-quarters of century of legislation and financial aid have, in the main, encouraged the development of rofts as homes for the elderly and as hobbies for those in other employment. Very asonably, many crofters complain. But very few realise-or are willing to admit - that e security of tenure and other privileges won in 1886, if too rigidly maintained, may timately bring about the decay of the very communities which they were intended to rotect.

175 the crofts at Kneep are still highly fragmented: the fifteen crofts comprise over one hundred
311 and eighty separate arable plots. The lotted crofts at Reef were cleared in 1842 to provide
427 land for a sheep farm. Plans to clear the remainder of the Valtos peninsula were thwarted
(228 by the Fisheries Board because Valtos and Kneep were then good centres for the white fish
[501 industry. As late as 1892 Valtos and Kneep had forty boats, providing employment for one
[464 hundred and forty-five men. Valtos with thirty-two boats and one hundred and twenty
fisher-men was second only to Carloway as a fishing centre in Uig. With the prosperity
of the fishing industry, the population of Valtos and Kneep had risen rapidly - from 467 in
1841 to 659 in 1891. Some, at least, of the subdivisions of Kneep date from this period.
Reef was scheduled by the Deer Forest Commission (1896) for resettlement by crofters
and in 1908 an attempt was made to do this, but agricultural experts advised against it, on
the grounds of poor water supply, scarcity of arable land (only ninety-three acres old arable)
and the risk that, if cultivated, the machair would suffer wind erosion. Nevertheless, in
1921, Reef was resettled by ex-servicemen from Valtos and Kneep. At the time the sheep
[233] farm was only carrying a stock of one hundred and seventy sheep - less than half the crofters'
sheep stock in 1959.

427 Tables 15 - 18 summarise the more significant points of the economy of the Valtos
178 peninsula. Table 16 illustrates the fact that the economy is in decline. Only two-thirds of
the total possible units are being worked. Many of the crofters have abandoned their crofts
[162] and the younger generations are unwilling to take over. Of those remaining to work the
crofts 18% are over sixty-five, and a further 47% are between forty-five and sixty-four.

5: Caird et al. K-5 (1958) 1959 ES10 Highland Scots ES10 Park

An examination of the agricultural situation reveals that there are insufficient resources to make the present number of crofts viable. Overstocking in sheep, an attempt to increase cash ncome, has resulted in a high mortality rate, and consequent losses. The tenant of a small croft s faced with a classic dilemma. If he puts all his efforts into the working of the croft, the area f potential arable land is insufficient to maintain a large stock and even if the best rules of usbandry were operated, croft income alone would be insufficient to provide a reasonable living. The fishing industry, formerly the chief means of a livelihood rather than the croft itself, has irtually disappeared, and he is forced to find ancillary employment in an area where little exists nd thus migration in search of employment is the only solution. The croft becomes a base for on-agricultural activity and a means of providing produce for home consumption rather than an ffective agricultural unit. On the larger crofts, it is clearly possible to make a living if sufficient dditional grazing in the non-crofting area is available - the agricultural townships, especially eaforthhead, Shieldernish, Habost and Kershader, which comprise units sufficiently large and rtile, bear out this contention. Yet better husbandry is possible, and reclamation of the common razings for improved stock rearing has started. The agricultural townships as a whole are better vourd by situation, soils and communications, and appear to possess a much greater degree of tability.

Since the decline of the fishing industry, the fishing townships have progressively declined. ncome from weaving has replaced earnings from fishing as a means of combining croft work and ncillary employment to provide a living, but, as has been pointed out, the supply of weaving ontracts is not regular and greatly depends on the state of the world market. The present cen-alisation of the Harris Tweed Industry in Stornoway is not favourable to the Park weavers: the uggestion by the Park Association[1] that a spinning mill be set up in Park would certainly help the cal weavers.

If the present number of agricultural units and level of husbandry on them is to be maintained, ncillary employment on a large scale will continue to be necessary, and, as weaving and the rvice occupations alone certainly cannot provide it in sufficient quantity, temporary and regular nployment furth of Park is bound to continue, and as this grades into permanent migration, the pulation must continue to decline and age. The capacity of the area for tourism is also limited. ith the overheads which branches of parent lowland factories would have to face, the establishment manufacturing or assembling employment is also unlikely.

A revival of the fishing industry holds out most hope but must take place before all the accrued ill has disappeared with the older generation of fishermen. The fishing grounds are within reach the modern £20,000 boat: by co-operation between crews, fish could be taken to mainland markets ch as Ullapool as indeed happens at present. Lobster fishing could be integrated with herring and hite fishing. Such a combination of several types of fishing would ensure a more balanced economy d the Herring Subsidy would be a guaranteed element of income. It must be agreed that if main-nd boats do come to the coast and sea lochs of Park, there seems little reason why local boats uld not also be successful.

As far as the land is concerned, the survey leaves no doubt that improvements in husbandry and stures are definitely possible. Yet, until viable agricultural units have been created, there is tle incentive for large scale improvement in either sphere. It is an expert's opinion that no crofter rking on a croft in Park which would bring in £300 a year would have time to engage in ancillary rk and at the same time fully work his holding in accordance with the rules of good husbandry. If s opinion is accepted, and if it is also accepted that such crofts are desirable and the present ccessful crofts in the agricultural townships where there is a higher proportion of full-time ofters than elsewhere would bear this out, it follows that ancillary employment on such units would ve to be ruled out.

[Marivig]

There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

Peats cut on the common are transported by lorry to the crofts, while peats from the north end of the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft, and with this supplements the family food supply. One herring boat, operating nightly from Stornoway and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the roads while several men work partly on the crofts but are periodically away whaling in South Georgia, fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual migration from Marivig, especially of the young people, is reflected in the high average age of the permanent residents, and in the numbers in the school -over one hundred pupils in 1900, thirty-nine including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road which reached the township from the west in the late 1920's has a tarred surface and is much better than the later road southwards to Gravir which is untarred. There is no church in Marivig and most of the population attend the Free Church in Gravir.

Within the township the two arms of the township road serve all but two of the crofts and the sites of the newer houses, few of them more than thirty years old, tend to be near the road, while the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron. All the crofts are supplied with electricity from the grid, but very few have a piped water supply; rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

[Gr-vir] [Glengr-vir]

241 beds are now covered by sphagnum moss and heather. Other lazy-beds are permanently in natural
[137] hay; only thirty per cent of the land classified as 'old arable' is now in oats and potatoes. If natural hay is added, one hundred and thirteen acres of crops are taken from an area greater than the so-called old arable; this suggests that the cultivated area was pushed beyond the limits of the old arable (ninety acres) after 1850-52. As in all the fishing townships the area of sown grass is infinitesimal for only four of the fifty-eight operative units actually sow grass. The wintering capacity of the crofts could be greatly increased by the general adoption of the practice of under-sowing.

241 There are forty-three legal crofts in Gravir but nine are sub-let, in every case to relatives.
423 All the crofts are taken up and there is evident pressure of population on the land. In addition to the crofts, there are a further ten cottars, and squatters and feuars, besides the fifteen legal Glengravir crofts (ten operative units) which have no share in the Gravir common. The common
[132] has been encroached on by several feus for Gravir is the functional centre of Park: the Free
346 Church of Scotland and Manse, the doctor, one of the two district nurses and two of the missionaries
759 (assistant ministers) are all located in Gravir.
[793]

233 Gravir and Glengravir thus have fifty-eight legal crofts and fifty-six operative units. Less than
311 half of the crofts with grazing rights are fully stocked and one quarter have under fifty per cent of the soum, including five without any stock. The common pasture of 2,652 acres is in general of poor grazing quality, dominated by the less nutritive species of grass and poorly drained. In 1957, a ten acre plot was fenced and re-seeded: only twelve of the operative units participated in this reclamation work, and the ages of the participants ranged between 27 and 58 years; this is significant as aged tenants are unable to carry out such work. This scheme could be extended annually; if potential improvements to the crofts are limited, pasture amelioration is virtually
[435] without limits. Re-seeding on a large scale would enable better stock to be kept rather than greater numbers; at present the sheep stock is over two hundred per cent of the sheep soum, and a ewe and lamb sell for as little as £2 10s to £3 10s, an indication of the consequences of over-stocking. The cattle stock is below the souming and this paucity of cattle is one of the notable changes in the agriculture since the 1930's for at that time as many as six cattle were kept on the larger crofts. The total stock kept in Gravir and Glengravir exceeds the souming by thirty-five per cent.

231 The great majority of the crofts can certainly not be considered economic units. Judging from
241 the souming of one cow and follower and eight sheep per pound sterling of rent in a township where
434 only seven crofts pay more than £2 rent, they were never intended to be self-supporting agricultural units. The produce of two cows and sixteen sheep, with potatoes, and in former days, bere or oats, locally milled by the three Gravir water mills, could scarcely ever have maintained a family. Fishing was the complementary economic activity, and in 1901 no fewer than nineteen boats and
[228] eighty-nine fishermen were registered at Gravir. Today, only one boat fishes commercially for lobsters.

463 If agriculture is singularly unrewarding, weaving occupies six of the males of insurable age and
288 service occupations a further ten males and five females, but neither weaving nor service occupation are sufficiently available or attractive to keep the insurable population in the district. Twelve of
[166] the males between fifteen and sixty-four years take seasonal employment and forty-six are in
[167] permanent employment furth of Lewis, in all sixty per cent of the potential male resident population.

175 The economic problem of Gravir, in common with the other 'fishing' townships, became acute
228 after the fishing industry collapsed after 1914; in the hey-day of the fishing most of the men fished
434 all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a man might make as much as £90 in a good year or as little as £5 in a poor year. Apart from the sale of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted
[233] the bulk of the croft income. Today, on the basis of the souming, the income of the largest croft including subsidies could only be approximately £150 excluding the amount to be set aside for home consumption of potatoes and milk.

[Kershader]

(b) From New Year to mid-April most sheep are kept on the common grazing. Practices, however, are irregular; some flocks are usually hand fed, others only rarely. In the former case they heft near the upper limit of their home croft and remain fairly close at hand. Most crofters hand-feed their lambs, probably housing them at night, allowing them hay in the morning and turning them on to the common grazing in the evening. All this naturally depends on weather conditions.

(c) From mid-April to May, lambing takes place on home parks.

Most crofters let their ewes-with-lamb out at one date.

(d) At the end of June, gimmers and wedders are clipped.

(e) In mid-July the ewes are clipped.

(f) The lambs are weaned in the first and second weeks of August.

(g) The dipping takes place in October and the rams are brought on the crofts.

There is no general sale time, sheep being sold or slaughtered at all seasons. There is no club stock, but all but one of the Kershader crofters, along with crofters from neighbouring townships, take full advantage of the arrangement, first established in 1941, to graze sheep at 2/- per sheep and 1/- per lamb in Park Deer Forest. Hence irregularities of rhythm are introduced or exaggerated.

Sheep are not particularly profitable: in general, wedder fleeces give 3½ to 4 lb, ewe fleeces about 3 lb, and the wool is sold to the Stornoway mills and to the Wool Marketing Board. Average sheep carcase weight is reckoned to be 41 lb, and the price rarely rises above £3 and almost never above £4. Braxy and fluke are kept under by medicaments but remain potential dangers; 'Black leg' is still a serious problem. Many sheep are drowned in the bogs in Spring and late snows (1955, 1958) are disastrous for lambing.

Under-employment is a serious problem in Kershader. There are nine males classified as full-time crofters, but probably only four of these (two on one croft) are in fact in this category, and of the total of thirty males with their homes in Kershader, only fifteen of the insurable population are permanently resident. There are twenty-eight females with their homes in this township, but on only six crofts do any of twenty permanently resident females help with croft work. Local ancillary employment consists of weaving, fishing (for domestic consumption only)and work on the roads. Boats, one with outboard motor, are owned by three crofts. The only resident professional worker is a nurse. Ancillary employment must be, and is, sought away from the township. As a result, of the 73 persons recorded as having migrated since 1939 or as being resident, periodically away and permanently away in 1958, 19 have left the area for good, 4 are permanently away, 8 periodically away, and only 43 are resident. Only one person has entered the township since 1939. The age structure of the population, too, is far from the optimum. The school in Kershader, which had 20 pupils in 1873, reached a peak of 110 in 1907 and declined to 28 pupils in 1953, now has but 17, although it serves Caversta, Garyvard, Kershader and Habost. Maximum population was attained in 1881, but the total remained fairly constant till 1911, after which decline was marked. Since 1950 this decline has markedly increased.

It will thus be seen that the most serious problem facing Kershader is that of stabilizing the population and giving it a stronger economic basis. Apart from the potential development of tourism, fishing, weaving and other home industries, the only possible occupation is in agriculture with perhaps a little forestry. Forestry, though important as shelter provision, cannot be a practical proposition in large blocks or on a large scale, as it would dislocate the

17

[Garyvard]

407 Only a fraction of the total arable land is cultivated by tractor and this is divided among seven crofts. In spite of an emphatic statement by one of these cultivators to the effect that he will never use it again, the use of the tractor will increase as soon as the pioneers are able to prove to their neighbours its capabilities and as soon as the lazy-beds are joined together, an improvement which has already taken place in Habost. The main objection to the use of the tractor by the disappointed user was the inevitable one that the yields were smaller than in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation, for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes
242 first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two acres of common grazing land by the road on the west side of the township, by nine of the crofters working together during the evenings. The work began early in Spring when 6 tons of lime, 10 cwts. of mineral phosphates and 8 cwts. of compound fertilizer were spread evenly over the land. The grass seed was sown in July, the most favourable time for sowing since there is less danger of a drought than earlier in the year, and more convenient too, in that the sheep had been gathered for shearing and 250 of them were available to be driven back and forth over the land to tramp the seeds in. In theory this land should be ready for grazing next Spring, but in practice it will be ready in November. It is planned to re-seed twelve acres in all.

231 Most crofters have a cow to provide milk for their own needs. The Black Poll bull at Gravir
234 is preferred to the other township bulls since its progeny command higher prices. Sales are held
432 in the district twice per year, once on the old lake-level on the east side of the township, and once
435 at Baliallan. Prices for calves are normally better in Spring than at the Autumn sale, nevertheless prices offered tend to be low. Even so, it is usually to the advantage of the crofter to part with the animal rather than bear the cost of taking it back to the croft and wintering it there. Naturally there is some bitterness that the middlemen who buythese animals will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but also at the local sales.

241 Crofting is not in itself a lucrative form of employment and in most households there is at
434 least one other source of income. A majority of the crofters have regular employment, two
463 working in quarries or on the roads for the County Council, another is postman, three are weavers,
464 another both weaver and contractor, while yet another works in Antarctic waters aboard a whaling
[288] factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the ancillary occupations, though the weavers are suffering at the moment from the slump in the Harris Tweed Industry which is also affecting the prices for wool. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

241 Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set to
226 catch mackerel and other demersal fish. There is not one large fishing boat, however, partly
501 because of the scarcity of fish near the coasts, and partly because of the isolation of the area and
[228] the subsequent difficulty in marketing. The Fleetwood trawlers are regarded as pirates in the Minch, and one has to its credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garyvard though it could be quite extensively practised.

361 The main road from South Loche to Stornoway through the village has obviously had a profound
431 effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built, in favour of sites conveniently near to the road. The Road Age has greatly
[241] limited man's capacity for carrying goods. This is well illustrated by the fact that the majority of crofters in Garyvard use artificial fertilizers, whereas they are scarcely used at all in Caversta where the road ends about 50 yards from the nearest house.

21.

162 his occupation matters very little. Unlike the Welsh,[35]
59 the Sriathanach does not particularly look up to the man
463 who prospers. Indeed, the people are more than likely to
183 [554] attribute his success to dishonesty or find fault with his character. I shall have more to say about this when we consider the topic of gossip.

463 At the same time, occupation is a factor in the
573 formation of cliques. The school teachers form one clique which has tended to become more and more exclusive in recent years. The shop keepers also have their small clique. Once a year they have a dance at the Royal Hotel. Within both social circles there are, of course, special groups
[561] of friends who associate regularly. Age grades provide another basis for clique formation. Clerks, shop assistants, and employees of the government are divided on this basis. Since it is government and, apparently, business and banking house policy to use the remote rural areas for a training ground and to make promotions, most of the newcomers and local residents who work for these agencies are young men.

[621] Neither occupation nor age-grades are exclusive factors in determining the social structure of Portree as they are for the crofters. If they were, I could not support the assertion that there is fluidity among the village population.
575 There are several clubs and fraternal organizations, such as a drama society, the Women's Rural Institute, An Comun

born, and 264 people died. In the 1961 national
census, Shawbost had a population of 598; ten year
later, the population was only 515. The significant
community of interaction, however, includes a much
greater number of people than are indicated by these
statistics, because the roles which absentee members
play in their community are important. The figures
[877] Tables I_A^1 and II_A^2 do not include five males and three
females in the 5-14 age category or six males and th
females in the 15-24 age category who live away from
home during the week to attend schools in Stornoway,
but who return home during the weekend and for holida
• [464] The statistics also omit eighteen males and eighteen
females in the 15-24 age category; fifteen males and
seven females in the 25-34 age category; four males
between 35 and 44, and two males and two females betw
45 and 54 who are away from the village working but a
as yet unmarried. These temporary exiles return for
long or short periods of time, to weave or work in th
mill, to care for aged parents, and to vary their die
of living until they become restless and set off agai

The Income of a Small Croft. The small croft is regarded by local agricultural experts as having a potential income of £20 a year. In addition, it provides a home, potatoes, some vegetables, milk, eggs, and the right to cut peat. Even if not quite legal until June, 1954, it frequently supplies mutton and, less often, beef for the family. The budget for this type of holding in my sample reveals that even when fully stocked and the ground tilled, the income may be negligible. Let us look at the cash income and net profit for 1952 and 1953.

In 1952 the cash income for the croft was £8 13s. 11d. The net profit, which takes into account depreciation and stock valuation after sales was £2 1s. 11d. In 1953 the cash income was £12 8s. 9d., and the net profit was £5 8s-. These figures include money from the sale of stock, government subsidies and grants, and home grown produce eaten by the family. Unfortunately, I do not know the number of hours which were spent earning this meager return. The crofter's wife said about 300 hours of her labor. To this we must add seasonal cooperative labor.

This particular croft is rented by a middle-aged married couple and a spinster sister of the wife. The man works full time as truck driver, leaving most of the work on the croft to his wife. The stock is two cows and followers and sixteen to eighteen sheep. There are six acres of arable land, half of it under hay and grass. The remainder is planted in oats, potatoes, and turnips. The budget may not be typical. For

565 many newcomers and the high rates of inward, outward, and upwar
mobility seems to have worked against any clear cut pattern.
Certainly, it requires more than non-membership in the highest
and lowest classes or socially recognized strata to form a
middle class. I look upon this indefinable strata as a neo-
class. This is not meant to imply the absence of ranking or
prestige status. Ranking is no less important than it is in
the rural neighborhood.

162 As in the neighborhood, a few professions automatically
554 carry high prestige; these are the ministry, medicine, and
463 teaching. Otherwise, a man's prestige depends more on his
183 outside activities than his occupation. Bankers are often
thought of as having prestige. In Portree one banker is
highly regarded because "he does an awful lot for the church."
Another, although respected, as evidenced by the use of his
surname when referring to him, is socially inferior because
"he never mixes with people" and "no one ever gets invited
to his house." The same holds for other occupations. One
man may be looked up to because he has taken an active part
in organizing an old people's welfare committee and was
instrumental in founding the Skye Council of Social Service,
the only rural social service council in Scotland. Another
of the same occupation is looked down upon because he keeps
to himself. To cast a shadow on whatever prestige he may
have, the people talk about a shady deal in which he supposedly
got involved and claim that his wife sells eggs. No one but
a crofter's wife sells eggs. If a man is a native Sgiathanach

178 For example, young people are able to leave the island
[464] and work in British cities or abroad, sending money
[457] home to sustain their aged parents who by law cannot be removed from the croft.

E. Changing Land Use

311 Darling (1955) described the previous Highland way
175 of life as a well-adapted, ecologically balanced system,
182 in which proper use of land was attempted by limiting the number of livestock, preserving a proper ratio between cattle and sheep, and regulating the flow of stock on the land throughout the year. Dikes (fences of turf or stone) and drains were communally repaired
178 and cleaned. Although continuity with the previous way
311 of life is evident today, the overall picture is one of
[182] partial use, and misuse, of natural resources. Various
[154] advisors from government organizations and colleges have been brought in to encourage effective husbandry and land use.

1. Specialization and Individuation: The change from an ecologically adapted, internally regulated community in which land was used intensively for subsistenc

178 but not as often as in the past. In the past boat
501 were in danger of being smashed by the strong seas
228 and winds that gained easy access to the Shawbost
[493] harbor; but today, because so many cars are avail
[504] the boats can be sheltered in the more protected b
of Carloway, five miles up the coast to the southw
[434] of Shawbost. Despite this protection and the incr
in income since World War II which would enable mo
people to buy boats, the number of boats remains s

175 In the past certain people were esteemed for
821 "knowing the wind and the sea." The sound of the
coming from different directions presaged differen
kinds of weather; a line of white across the bay
bad weather in a few days. A fifty-year-old man s
"My father and grandfather could tell when a storm
coming. They needed to know, and they didn't have
radio and television to tell them. I would know t
signs, too, if I had listened to them."

175 Not only was there local fishing, but the men

44

0 in the far north. "There were two fishing seasons.
For one season you went to Fraserburgh, Stornoway,
Lerwick and Peterhead; and then the winter fishing was
in England, at Yarmouth, Scarborough and Lowestoft.

I remember in Yarmouth we didn't like the English
bread, it was such a dull color. We liked the pure
white Scotch bread."

They lived in small huts, and the work was hard but
full of fun. Neighborhood girls used to get together,
bringing bedding and different items in large chests to
share in the housekeeping. Three girls worked together
in a crew, and there were as many as six sharing a room,
in double bunks. Some of the huts were so small that
there was barely enough room for the beds and the cooking
stoves. At night the boys would come in off the boats.
"You were so tired from being up since early morning!
but you were always able to dance. You were treated with
respect; the youngsters today aren't so good." The
women who married non-islanders that they met at the
fishing were not likely to return.

When the weaving started on a large scale, the girls
were glad enough to have work at home, even though the
work was hard. But many continued their temporary
absences from the island, working in hotels or as

45

domestic servants among the well-to-do families in
Glasgow and other cities on the mainland (see Appendix
A).

When the weaving started, some men settled at home
permanently, but many continued to come and go between
the sea and the loom. In 1931, the ratio of men to
women in Lewis and Harris was 100:114. The men came
home for temporary jobs, such as the construction of roads
or houses. Jobs are told of the common practice of
spending for an extension of leave. The men found it easy
to join the Naval Reserve because of their fishing
experience; and it brought them a retainer's fee and
expense-paid trips to places off the island for several
weeks of training during the year. But when the wars came,
the loss of men to the Navy and to the Merchant Service
was heavy.

B. The Land

The number of arrears in rent in the Barvas rent
ledger at the turn of the century indicates the small
amount of money in circulation at the time. Between 1899
and 1914, several crofters paid part of their rent "by
work," and six had some of their stock "uplifted by
decree." For example, a Widow Catharine lost "one red

56

of potato crops by blight had contributed to widespread
poverty. The production of cloth for non-local markets
was promoted initially by philanthropic proprietors in
an effort to ameliorate such conditions. Lady Dunmore,
of the Dunmore family that owned Harris during most of
the 19th century, was largely responsible for developing
a market in London and elsewhere for cloth woven in Harris.
The cloth was popular first among the aristocracy, who
wore it for hunting and other sporting occasions. The
romantic image of a cottage industry promoted for charitable
purposes contributed to the market value of the tweed.

The market expanded in the second half of the 19th
century, aided by ladies of leisure who followed the example
set by Lady Dunmore (cf. Hunter 1964: 24-26). The
production of cloth for a commercial market spread from
the lands of southern lairds, but was slow in coming to
Lewis, where the proprietor, Sir James Matheson, provided
the people with construction jobs. After Matheson died in
1878, weaving for outside markets began in Lewis in the
parish bordering Harris, and the name "Harris Tweed" was
used because a market for cloth of this name had already
been established. By World War I, weaving for outside
markets was being done in all four parishes in Lewis. In
1899 there were 55 looms in Lewis and over 200 in Harris.

69

the 1934 decision to change the word "crofter" to
"islander") led to the weavers living in council
houses in town and working in lumberhouses behind the
houses. Unequal distribution has also contributed
to Shawbost's relative prosperity, and to the decline
of weaving in more remote parts of the island. The
unequal distribution of tweeds has made it difficult
to maintain a large labor force, which in turn limits
the growth and development of the industry.

3. Instability of the Industry: The Harris Tweed
industry has undergone a number of crises. Periods of
expansion have alternated with periods of prosperity.
See Appendix B for the fluctuation in the number of
yards stamped each year with the Harris Tweed trade-
mark.) The very conditions which give the tweed its
market value--the decentralized, non-mechanized human
element--also limit the possibilities of growth in the
industry, and contribute to the industry's instability.

When a business remains small, it must collect
orders before it can provide work to have the orders
filled (except when demand for an item is strong, as
occurred around the time of the previous world war;
during the war and for a few years after, tweeds could
be made first and then marketed, because any cloth
could be sold). Only a large business can keep weavers

71

in Shawbost: a very small business, which until
recently did not even have its own transport but
hired fastlisies when they were needed and simply
went into hibernation when orders stopped coming;
a medium-sized business, which went into liquidation
in 1971; and a large business, which continues to
survive despite a depression which has continued
since the late 1950's.

Harris Tweed is sent to markets all over the
world; has because of the difficulty of maintaining
a large labor force, the filling of orders is sometimes
slow. If large orders cannot be met, weaving as an
island-wide occupation cannot be maintained. The
number of weavers on the island fluctuates, as slack
periods come and men adopt the time-tested strategy
of temporary migration in search of other jobs. One
of the factors which aided the weavers during their
strike of 1941 was the fact that so many other jobs
were available during the war that the future of the
industry was jeopardized.

In the last five years the number of mill employees
has decreased from 800 to 500. The decrease is due in
part to the introduction of more efficient techniques
and new equipment, but there is little room for improve-
ment in the production of tweeds because the human
element, the weaver, is essential to its production.

72

GGO element, the weaver, is essential to its production.
In 1960 weavers receiving tweed yarns from the mills
totalled about 1,500 persons, a number which held for
about three years and then started dropping at a rate
of about 100 a year. In 1971 the number of weavers
was less than 1,000, and trends of change appeared to
presage a continued dwindling of numbers. It is
estimated that emigration increased during 1970-71.
Men have returned to the sea, have gone to Glasgow as
laborers, or have taken advantage of training courses
offered by the Labor Exchange, courses that will
eventually remove them from the island setting.

The instability of the industry and the fluctuation
in amount of weaving work available at any given time
has created an environment in which personal ties and
individual maneuvering rather than a widespread adherence
to impersonal rules such as equal distribution are
emphasized. Strategies which involve the mobilization
of kinship and neighborhood ties and involve an emphasis
on personal relationships rather than the depersonalisa-
tion usually associated with industry are made possible
by economic factors such as the dependence of decentralized
weavers on centralized mills. The watchfulness and
consciousness of one's neighbors so characteristic of
village life prevail. Questions about the state of

75

Despite these aids and incentives, parents do not
encourage their children to weave. The weavers them-
selves describe the job as dull, offering no security
and no possibilities for advancement.

Referring to her young son, a mother says, "By the
time he's old enough to weave, the tweeds will have
failed." Another mother says, "I wish him to learn
some trade, if he's intelligent enough. I don't want
him to stay here. The tweed is so uncertain." "There's
no future in it," says the father of another young boy,
"I definitely wouldn't want him to be a weaver. It would
be good if he went to engineering."

The histories of the weavers reveal many examples
of shifting occupations. Weaving often alternates with
work in the local mill, which is also relatively
unspecialized. The Shawbost mill must tolerate this
unstable labor force, as labor is difficult to find.
Weavers tend to leave the island for more stable,
permanent jobs, leaving the croft and the loom to their
younger siblings. Table 7 shows the number of male
weavers in each age group.

The fact that Shawbost has the same age structure
as the rest of rural Lewis (see Table 11) and less
unemployment signifies that weaving has not served as
an adequate incentive to keep young people on the island.
[See p. 21--Admlyst]
[See p.111--Admlyst]

Rather, the industry has provided jobs for those who,
for one reason or another, would have stayed anyway.

Of the weavers between the ages of 15 and 24,
eight are only sons or sons who had to begin work because
their fathers became ill or died; two others live at
home only temporarily and plan to work elsewhere. Of
those of ages 25 to 34, two men live at home because
they are disabled; one has returned from the Merchant
Service for awhile; two are only sons who are encouraged
to remain at home; and several are youngest sons or sons
whose parents have strongly discouraged them from
leaving home. Of the 35-44 age group, four have remained
on the island because of various ailments such as
tuberculosis and mental health problems; one had to
leave the Merchant Service because of an injury; at
least five have stayed or returned because of family
ties, the demands of aging parents and sick siblings.
In the 45-54 age category, a number of men served in
the navy or other branches of the armed forces during
World War II, and returned from shipwrecks and other
disastrous events to the relative security of the loom.

Many of the older weavers (at least nine in the
55-64 age category) started weaving after they had
returned from the United States or Canada because of
the depression. Some recall the horror of wandering

through alleys to rummage through the trash cans of
hospitals or other large institutions for food. The
occupational histories of the weavers support the
generalization made by an official of the Harris Tweed
Association that the younger weavers leave because
they do not like the weaving and they are replaced
easily by older men who want to settle down after a
life at sea. (See Appendix A for several life histories
of weavers.)

E. Crofting as Strategy

Because of the relatively high income provided by
the Harris Tweed industry, those who remain within the
township have tended to emphasize weaving and neglect
the croft.

1. Croft as Place of Residence vs. Agricultural Unit:
Most of the 169 households consist of married couples with
their unmarried children. A tendency to marry rather
late in life and for children not to marry while their
parents are still living is evident in Table 12. Partial
List of Households According to Type of Household and
Age of Household Head).

Fourteen households of married couples and their
children (not included in Table 12) include at least one
[This source as received did not contain this
table--Admlyst]

A 60-year-old woman remembers that it was a
621 common practice, when she was young, for children from
571 large families to live for as long as six weeks with
446 other families who were relatively better off. They
would help harvest the hay or the potatoes or bring
in the peat in return for food, lodging and perhaps
some clothing. "They usually ate better than they did
at home." The children were not necessarily relatives
of the families with whom they boarded.

621 Strong friendship, that is, the kind of friendship
572 associated with mobile urban life in which persons
confide in each other and share secrets and build up
an individual relationship based on extensive knowledge
[602] of one another, was nonexistent. A "friend" was a
relative, or someone who gave aid when it was needed.

621 Today it is sometimes said, "It used to be that
178 your relatives were your best friends; now your best
572 friends are better than your relatives." An old man
[602] will meet another on the road and say, "I used to see
more of you when you needed me." Neighbors used to
[623] share sheep that were killed; now households kill and
[251] consume their own sheep, and freeze the meat which they
cannot use immediately. Groups that walked out together
● [463] to the peat to finish the job in a single day are being
replaced by individual family units that can motor out
ooo and do the job in stages. People prefer to give money

632 to neglect crofting and to concentrate on weaving. Those
578 who still participate in crofting activities may neglect
their communal obligations, such as going out on the moor
after sheep, and may prefer to harvest crops, cut peat
or perform other agricultural activities independent of
other villagers.

632 Despite these tendencies, certain criteria of firm
178 neighborliness are still found in the township network. All
462 the adult males of the township, including non-crofters,
are responsible for serving as officers in the township
grazing committee. The committee draws up rules for the
[654] organization of communal crofting activities, and applies
for grants from the Crofters Commission or Department of
Agriculture, for example, to build a new township fence,
plant trees as shelter belts for livestock, extend a peat
road, or to fence and reseed areas of moorland in "township
reseeding schemes" (see Chapter 2). All adult males of
● [463] the township are expected to provide labor to implement
such plans.

632 Township meetings, chaired by the clerk of the
571 grazing committee, are held twice a year. A vote is
666 taken when any decision is to be made. The vote is usually
unanimous, as all discussion, argument and persuasion
have occurred before the meeting, and those who disagree

121 being determined by conditions of culture, such as
121 political and economic conditions. Under conditions
178 of gradual centralization of economic and political
182 systems, the geographically marginal crofting areas
have evolved strategies, some of which puzzle agencies
concerned with development or other aspects of
governmental process.

178 Before the North of Scotland Hydro-Electric Board
365 began to operate in the crofting counties, not more
511 than one croft in every hundred had electricity; but
by the end of 1951, one in every six holdings had been
supplied (Taylor 1954: 20). "The light" came to
[354] Shawbost in 1951. Before then, the islanders used
[189] Tilley lamps, a Canadian invention; and before then,
double-wick paraffin lamps. Piped water came a few
[312] years later, around 1955; it was brought from a nearby
● [463] loch, and the construction work gave temporary jobs to
local people. The availability of these services
[344] facilitated the building of county council houses,
[342] which many welcomed as providing a relief to the
congestion caused in part by rules against building
more than one house on a croft. But, paradoxically,
[651] with larger, better homes and all these services came
a decrease in the advantages of living in a crofting
township: property was assessed and people began paying
rates or taxes.

241 Crofting constitutes a dormant strategy which can
178 be mobilized if deterioration of land has not proceeded
too far, and if the skills of land use are not lost by
succeeding generations who have grown up in an
environment which presented them with more appealing
strategies.

B. Social Marginality

166 1. Linguistic Distinctiveness: Social marginality
● 463 began when the Highlander had to leave his place of
origin and go to the cities of the south in search of
[199] employment. The feature which most distinguished him
was his Gaelic speech.

In Glasgow the common word for Highlander is
101 "teuchter," a slang word with derogatory implications
186 which, according to one theory, developed when Gaelic
498 speakers coming into English-speaking cities mispronounced
the word "sugar" so that it sounded like "teuchter."
[322] Glasgow Highlanders have developed their own defensive
explanations: when the civilized Highlanders came down
among the uneducated barbarians of the south, they came
as tutors, a word which their uneducated Lowland pupils
mispronounced.) According to a university student from
the islands, the word was once used by the English to
refer to the Scottish Lowlanders.

The
575 organization receives a large proportion of its funds
199 from the Scottish Education Department, whose statutory
186 duty is to foster the speaking of Gaelic in Gaelic-
[659] speaking areas. In 1970-71 a series of evening meetings
were sponsored by An Comunn in Stornoway; but the
serious meetings, such as readings of Gaelic poetry, were
attended largely by schoolmasters.

Associations which sponsor Highland dancing and the
opportunity to get together with other Gaelic speakers
thrive in Glasgow, London, Toronto and Detroit, everywhere
[498] but in the Gaelic-speaking Highlands. Such associations
serve important functions in situations of interaction
between Gaelic speakers and members of the dominant
society; they provide identity and self-defense against
those who react to them as members of a lower-status
minority group.

A girl who teaches Gaelic in Glasgow and comes home
535 to the island only for holidays never goes to the island
186 dances, but loves going to the dances sponsored by the
498 Lewis and Harris Society in Glasgow. All the young
people from the islands come, and dance away accumulated
insults in a fiery sense of belonging.

● 464 A girl who worked in hotels on the mainland found
197 herself speaking Gaelic with her fellow workmates who
186 came from Lewis or other Gaelic-speaking areas, although
571

● 464 on the island she had spoken English in school and had
197 not given much thought to which language she was speaking.
186 "I suppose it was because the other girls couldn't under-
571 stand us. They always used to mimic us, making noises
like they were talking it. It was nice to be able to
talk about things and not have anyone else understand,
especially when they teased us so much."

197 But on the island itself, the number of persons
198 speaking Gaelic is declining; and the scope of the language,
[512] i.e., the range of situations to which it applies (as
reflected in the diversity of vocabulary used), is becoming
[196] more restricted. A psychological experiment in which the
[741] semantic differential was used to study the organization
of English and Gaelic vocabulary in the cognitive processes
of Gaelic speakers suggests that Gaelic speakers are not
bilingual but monolingual in particular situations (MacLeod
197 1966). Gaelic is the language of hearth, home, family and
191 community. English is the language of education, the
business world, and various transactions with the larger
197 society. Most Gaelic speakers spoke only Gaelic when they
371 entered school, but were required to speak only English in
191 the classroom. One islander recalls, "The first English
[696] words you learned were 'Sit' and 'Stand.' Those were the
days you got strapped if you spoke any Gaelic." Children
ooo were addressed by their full English names. One of the

241 Cultivation for subsistence is minimal, and in
654 part stems from government-defined privileges and duties
regarding maintenance of a croft. The Harris Tweed
232 industry, which is restricted to the Outer Hebrides and
● 463 thus is protected from competition, has provided work
for a large number of islanders. Many of the younger
[184] members of croft families live in cities on the mainland,
and send part of their wages home; they return regularly
[162] to the island, and many plan to retire there. Thus the
[632] township supplies urban workers who remain very much
attached to the rural townships, which are composed of
aged family members and a rural proletariat. The standard
511 of living is high, and many crofters have accumulated
654 savings, although much of this surplus is used by the men
213 for alcoholic drinks.

121 In Britain, rural communities have been interpreted
as lying somewhere along a rural-urban continuum (cf.
Southall 1959, Frankenberg 1966). In 1959, Southall
presented "an operational theory of role" by which he
suggested that heterogeneous societies may be analysed
and compared. He developed the concept "density of role
texture" to describe societies which lie along a continuum
from rural to urban. Frankenberg (1966) uses Southall's
concept along with other concepts to present a more
complete model of an urban-rural continuum. The "models"
of both Southall and Frankenberg are essentially lists

● 459 After
● 464 being discharged from the army, he married the Shawbost
girl he had been courting, but soon after returned to
Glasgow in search of work. A doctor advised him to quit
the factory job he had found because the dust endangered
his wounded lung. He then attended a technical college
for eighteen months in preparation to set up his own
business, a bakery; and again, his wound defeated him.
A doctor advised him that a bakery filled with flour was
the worst environment imaginable for him, and that he
should go back and work the land on the islands, where
the air was clean. He returned to Lewis and to the
croft, and when his sons were old enough they assisted h
[184] with croft work and weaving. He still makes a yearly tr
to Glasgow.

The Bodach Beag

"The Bodach Beag" is known for his shrewdness,
[166] industriousness, mechanical ability and kindness. He is
one of the many Lewismen who left the island in 1926 on
the ship called the Metagama, and like many others he
returned to the island during the depression. His elder
brother had survived the sinking of the Iolaire, the ship
returning home with servicemen after the war that sank
not far from the Stornoway harbor in 1919, and was never
well afterwards. "He would sit in at night, off by

*159 did not receive much schooling. He stayed at home for a long time, helping his brothers with the crofting and weaving, and working at the nearby dairy. For a time the brothers made concrete blocks for sale, and ran a [166] lorry. In his late 30's and still single, Padruig went to the mainland, where he takes on various driving jobs, returning home periodically.

Seonag Thormoid

*159 166 •464 Seonag Thormoid left the island in 1933 at the age of 16 to work in the hotels. Her mother had worked in domestic service before the first world war. "You were raised with the idea that you would go away. I've prepared my children for the same thing. Any work that exists here is temporary. You can't depend on it. Even though things have been good since the war, they're getting bad now."

Seonag went to Glasgow with three other girls from Shawbost, and stayed with her aunt until she found a job. "Jobs were very difficult to get, and the wages were low. These were the depressed years, which didn't pick up until [465] just before the war. I earned L2/10 a month working for a Mrs. Smith. You could buy shoes then for 12/6, but that was a week's wages. The richer families in Glasgow had five or six servants. You were treated like scum.

*159 288 they leave school, and most of them get married. I remember about twenty girls working there, and they all [458] got married, and another young girl would start. During the slack periods some men would be paid off. They would start in other jobs, and wouldn't be prepared to *159 •464 come back. If you weren't working in the mill you were weaving; there was road work on a very small scale. Except for sailing there was nothing else. For the last ten years or so the big contractors have given people job

"I started with a building contractor but preferred to come back to this job, for the main reason that I had *159 288 458 built this house here. We had slack periods, but we picked up again. But this slack period, it's been two years now, and I don't think it will pick up again, unless they go to a wider cloth. Probably the fashion has changed. People have gone on to other types of cloth. And the merchants and tailors prefer a wider cloth, it's less waste. But that means changing the loom and a lot of machinery in the mill as well.

"I'm sure the weavers wouldn't be prepared to put [435] out the extra cost for wider looms. At the present time, a loom and winding machine cost close to L400. You can imagine what a wider loom would cost, up to L1,000. They don't want the power loom. They're trying to hold onto the Orb trademark for as long as they can. That's the big

342 adequate air-space, and windows opening at the top and
746 usually kept open by day, in which a woman can work at
178 ease. The Department of Agriculture aided the building
656 of a good standard type. The quality of joinery and
[335] masonry or concrete work improved, one fairly skilled
[333] workman usually directing the householder and friends as amateur builders. The cost of materials was met by a grant, generally of £250, half being repayable by an annual rent of £6 : 10s. for twenty years. Repayments proceeded satisfactorily. No scheme organised by the Department of Agriculture for Scotland won so general a commendation as this of house improvement. It made good use of family initiative and responsibility, with neighbourly co-operation not called for upon a large scale, a township at a time, but in quite a small, personal way. Nevertheless, had more guidance been provided to the builders, the
• [464] houses could have been really well built. For lack of this, perhaps, crofters increasingly prefer to pay for skilled work, though helping actively. Appendces I (ii) and II (ii) gives pre-War and post-War statistics.

3. *The Township and its Changing Plan*

361 Where absence of rock and boulder permits ploughing,
[182] the village land is laid out in a series of parallel strips,
[491] aligned with the slope. The road runs either parallel with shore or river, or at right angles to it. The intermixed possession of strips by 'run-rig' characterised the Lowlands before the Enclosures, and is frequent in
[423] the Highlands and Isles. The apparent regularisation of field lines may conceal the fact that an individual holder's plots may be scattered amongst those of others in fixed
[182] run-rig. This is an advantage where quality of land is so patchy, and each man thus gets his share of good and bad

162 weaving and fishing, the fall in population would probably
[167] be small, if any, in 1941. This fall in the total figure was
[168] not so much a decrease in the number of families as in the number per family. The Island was only then following the restriction of population begun half a century before in the rest of Protestant Britain, though the causes, social and economic, are very dissimilar. Actually, little did occur to change either the rural situation or that of Stornoway, until the outbreak of war in 1939.

162 Since 1931 there had been no real decrease: Lewis is
178 a land of house-building, not of ruin and abandonment;
369 of increase of holdings, not diminution, and even of agri-
[657] cultural improvement. No doubt 'artificial' causes were at work: first, loans, grants and unemployment insurance
[593] and assistance—once known as 'the dole'—and, secondly, the money sent to elderly parents and dependants at home
[888] by young folk in Glasgow or abroad, or savings brought back by the young people themselves. Yet there is some
[226] fishing and agriculture still. Above all, 'hand-weaving'
[241] has grown, even if this be partly 'artificial'. Recently it was not only the elders who had returned to the Island, but
[286] men and women in the prime of life, so that the question of resources, livelihood and population in Lewis needs to be re-examined afresh.

167 The emigration which took place from 1949 to 1951
• [464] followed directly upon the losses and the unemployment in the Island's Harris tweed industry. This crisis resulted
[651] from the imposition in 1949 of a Purchase Tax on hand-
[162] woven Harris tweed of 666 per cent. If the tax had been maintained and no adequate adjustment made, the effects on population would have been far-reaching.

167 left the Island. Yet after 1931 many returned, owing to losses and unemployment both in British towns and over-
[288] seas. When emigrants began to come home the 'Harris'
[178] tweed industry had spread to Lewis and offered increasing employment. Some men still fished in family-owned
[464] Island boats, and others as paid hands (on boats from
[226] the East Coast), though losses and unemployment were suffered.

178 Inter-war changes were hastened not only by movement
177 beyond the Island—an influence at work for three or four generations before—but by mobility within it. In 1919 a
493 small mail car made its way daily from Stornoway along
[205] each of the five main roads, with an occasional passenger. When crofters crossed the Island to Stornoway they went on foot or took the pony and cart at a slow walk: it was a day's journey. Ten years later, Ford vans, bought second-hand, ran daily to Stornoway from every township. Frequency, ease and relative cheapness of movement came late in an Island with no railway: the mobility of the motor for marketing and shopping brought rapid change.

178 'Hand-loom' weaving had become an important, if
286 precarious, resource, important because of the capital invested and the labour employed, yet precarious because
[433] of its dependence upon name and sentiment, not only
[462] upon intrinsic value. In Harris many women had spun and woven for sale for over a generation before 1914, mostly weaving pure hand-spun yarn, and they continued to do so. For many years before 1914, an occasional weaver was to be found in villages in Lewis too, generally weaving a handspun weft upon a mill-spun warp. By 1939 it was estimated that there were about 1200 looms in the Island, chiefly weaving mill-spunyarn, most of it spun in the two principal Stornoway mills. A carding mill

178 so creating a small leak in the purse and in the mind,
207 leaving both a little emptier, week by week. Surveys made by teacher-members of the Educational Institute of Scot-
[525] land describe the effects on listeners in Highland parishes
[829] as pernicious, in the main. The reports of the B.B.C., on the other hand, emphasise their cultural endeavours, and the lightening of house-work and of rural monotony or solitude. Every effort is needed to aid a happy selection in home and neighbourhood.

72 Experiences undergone in war were of very differing
201 types. Many men spent the war years in the Navy, without contact with decent town life, or others in the Merchant Marine. Of combatants in the land forces, the Territorials of the original 51st Highland Division experienced a few months of relative inactivity in France, then of a brief but bitter campaign, followed by long years in prison camps, while other soldiers underwent prolonged training in Britain, followed by severe fighting for long periods, far afield. Lastly, a limited number of men served in engineering or other works of war-time industry, though labouring work, at high wages, kept many of the older men employed at
[462] home. Of the women called up for service, some were posted to the Forces, some to the Land Army, and some were
[162] sent to factories. The greater opportunities for women to earn a living wage away from the Island tend to equalise the ratio of the sexes.

177 An experience new to the Western Isles came with the establishment of Air Bases. Not only did their construc-
[464] tion provide high wages for labouring for the older resident crofters, brought daily to the Bases by bus from their townships, but for the first time a heterogeneous mass of men from every part of urban Britain was put down at the doors of these quiet communities—at a time when

SEA ROUTES

ngs of nineteenth-century civilisation, however, they grew end on items brought by sea. Imported food, clothing, wood, domestic utensils and the like were slowly assimilated as ensable everyday articles. But there was relatively little ex- n return; then as now, any transport operator struggled the fact that traffic was one-way and the freight charges pay for the double voyage. Though the fishing industry and the Harris Tweed industry were, around the turn of the ry, to do much to determine and stabilise shipping develop- , both passenger and cargo services were always facing loss than profit.

the social side of the picture, the regular call of ships to the , to Stornoway in particular, was a welcome, quickening hat the island was significant in some way to the outside . The ships brought visitors who made the island, and the ides in general, better known to other prospective travellers. exposure of the island and its folk to the gaze of the main- led to a wider knowledge and understanding which without brought improvements in social welfare and a basis for mic development. When many islanders found it necessary to Glasgow and the south for work, the ships of the Minch d as a firm link with home, to which they returned when- hey could. This feeling for home is still manifest today in the men in Canada who charter an aircraft to Prestwick each so that they can holiday on the island. Since 1900 or so, pas- r traffic has been two-way : emigrants, migrants, visitors and ess travellers. When the fishing industry was in its heyday, the carried hundreds of fisherfolk across the Minch to ports as outh as Great Yarmouth to 'follow the herring' round the s of Britain and back to the Minch again. Traffic today is onsiderable, with the air-link with the island being used to its city.

a community where Sabbath observance is an integral strand ligious belief, ministers have on occasions tried to preserve Mosaic sanctity of the Sabbath Day by restricting the move- of ships in Stornoway harbour. In deference to local feel- he Stornoway steamer has always docked for twenty-four s over Sunday, to leave port for Kyle just after midnight.

HARRIS TWE

finished cloth. About 1,000 workers are employed at the representing about 95 per cent of the island's industry—not co ing, of course, the 1,200 or so self-employed weavers. The S bost mill, started in 1915 in a very small way, employs a seventy people from the surrounding crofting community on ing the wool, carding it and spinning it into yarn, and has a 500 weavers on its books. In 1955 it became a limited com and a £35,000 finishing plant was added; other recent exten have been made to the tune of £70,000. The establishme such a large industrial complex in one of the remotest par Britain is an achievement to be underlined.

The early cloth industry

Coarse woollen cloth has been made in the Hebrides, other rural Highland areas, from time immemorial. Rents often paid in blankets or plaiding. In 1656, 'pladding' was o the items of trade brought by Highland boats to Glasgow fo there. In the late eighteenth century, blackfaced sheep were i duced into the Highlands and islands; the fleece from this was much heavier than that of the native sheep and consequ proved ideal raw material for local woollen manufactur trade. In the Hebrides, the product was mainly for domestic local consumption. The people of Harris, however, were known for the excellence of their weaving which found a lin external market. In 1844, the Earl of Dunmore, the first native proprietor of Harris, had the Murray tartan copie tweed by local weavers, so successfully that the Earl an enterprising wife encouraged improvements in the product introduced it to their friends. The cloth, ideal for outdoor suits such as fishing and stalking, found ready wearers. In 1 an Edinburgh lady went about getting orders for the H weavers, and business increased so much that in 1888 she m to London and opened a small depot for tweeds.

Thus by the time the nineteenth century had reached mat tweed was becoming well known, and weavers and local chants, usually shopkeepers, developed sales contacts on the m land. At that time every web of tweed produced was uniqu could never be copied exactly. This of course added to its c

of a knitting industry based on the crofters, who would use Lewis yarn and produce knitwear in addition to their woven fabrics. However, it was found that the yarns used for Harris Tweed were unsuitable for knitwear, not being given sufficient twist in the spinning: before women use this tweed yarn for knitting, it is common practice to twist two or more threads of yarn together on a hand spinning-wheel.

Little in the way of craft work is done on the island, mainly because of the lack of indigenous materials which could be used to produce typically-island items. Marram-grass has been suggested as being suitable for making agricultural wind-breaks, and close-woven basket-work. Shore-stones and pebbles are plentiful both in quantity and variety of type and colour.

Small employment outlets on the island are marine and motor engineering, mainly based on Stornoway, and boat-building. This latter is a small but socially-significant firm in Ness with products with a high reputation. Construction and general building is of some significance, one of the most enterprising firms being built up literally from scratch so as to become a highly-successful island business.

The unemployment problem

The island's unemployment problem is as much a matter of concern today as it has ever been, averaging about 25 per cent annually (representing well over 1,000 people) compared with the Scottish mainland figure of 6.0 per cent; the contemporary figure for Britain is around 3.0 per cent. While unemployment as it affects adults is serious enough, unemployment among teenagers threatens the community's whole future. The island has its Youth Employment Officer, who has an unenviable task. Each junior and secondary school in the island is visited to interview school-leavers, at least once a year; employment advice is given and this is supplemented by Careers Officers' visits.

Such employment openings as exist over the island's limited spectrum are concentrated in Stornoway. They are, however, mainly in shop work, mill work and hotel work for girls, with a few vacancies for apprentices in trades generally associated with building construction. Most of the jobs offered are very much in

177 most of the young men of the Islands were away. Hitherto,
[464] though people from the Isles had gone out into the world and rubbed shoulders with all sorts of men and women, from best to worst, their own homes and townships had remained inviolate. Now, however, there came men in numbers from distant homes, with little to do when off duty and with money to spend, either on tweeds, which were virtually free of controls, or on pleasures, if they could find them. The temptations offered to a community so unaccustomed to town ways were considerable.

729 Those who returned least changed in their outlook upon
178 rural life were ex-prisoners-of-war, from the 51st Highland Division. At their own wish, they had received instruction
[423] in modern small-holding; and the demand from prison camps for land when the Highlanders would come home was upheld. It is especially among these men that agencies such as *An Comunn Gaidhealach* kept Gaelic tradition alive, linking it to the Highlanders' long thoughts of home. Next to these come naval seamen, while those most subject to urban influences were those who worked in factories. But whatever their experiences, home exerted a strong attraction. If work and a fair wage can be found in the township and on the crofts, and if social life can be renewed, many who returned will stay.

726 As in the First World War, so in the Second: few communities in Britain have had so large a proportion of their men in the Forces, in the fighting line and at sea,
[177] from the outbreak of hostilities. The Island community
[167] is almost without the exemptions due to 'essential occupations' such as commercial agriculture in the country, or
[729] war industry and administration in the towns. The toll has been heavy, and the nation's debt to the Islanders should be remembered.

464 For a year or two after the war many men and women
[288] returning from the Services, the sea or the factories found
employment in the flourishing Harris Tweed industry.
[729] This included work in the spinning mills and hand-weaving
at home—work in which the male weaver was helped by
[226] his family in jobs such as bobbin winding. Few fishermen
dared to sink capital in new boats and gear, and risk losses
[178] such as those sustained after 1920. Few women wished to
return to the hard, uncertain work of gutting. The whaling
[462] station, built on West Loch Tarbert before 1914 and open
for a short time between the wars, was reopened in 1950,
and employed some 30 men for 18 months before it closed
[241] in 1952. Crofting was lightened by some mechanised
cultivation. The war-time construction of air-fields had
[722] ceased, though some harbour-work and road-making was
[654] assisted by government grants.

In 1949 the Harris Tweed industry, now the Islanders'
288 main source for earning, was crippled by the imposition of
651 a 66⅔ per cent purchase tax on hand-woven Harris Tweeds.
648 Parliament decided that as a non-utility product, its export
sales alone could be exempt from tax. Viewing the
[433] position of the tweed industry in Britain as a whole, there
were strong arguments for the extension of the tax to
[171] Harris Tweeds: the high-grade industry of the Scottish
Border or the manufactures of the West Riding should not
be subjected to unfair handicap. At the same time the
crippling of a handicraft practised by peasant or artist
favours mass-production to the loss or ruin of traditional
and experimental workmanship or design to which, in the
end, the mass-production is an unacknowledging debtor.
The obvious economic handicaps of Island hand-weaving
[439] may surely permit some latitude. The export trade in
[458] Harris Tweed, in which the imponderable 'sentimental

3: Geddes K-4, 5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

178 crippling losses suffered after 1914–18. A beginning has
228 certainly been made. The Herring Industry Board's scheme for
434 'Queen of Scots' kippers will help the Minch fishing. It will not necessarily help the ports of Stornoway or Tarbert, because herring can be landed at mainland ports and treated there or else taken by road to the Moray Firth, kippered there, and still qualify under the scheme. The Scottish Agricultural Organisation Society has aided the marketing of lobsters to good purpose.

(iv) *Other Sources of Income earned in the Island*

114 It is to be hoped that members of the Lewis Association
814 may ascertain these, perhaps in collaboration with University research workers. This, in turn, might instructively be collated with the imports and exports of the Island, which are recorded and ascertainable with a precision impossible for a similar area on the mainland. Thus the facts would throw light on the economy of other crofting districts.

(v) *Allowances, Pensions, Unemployment Assistance and Remittances*

657 With regard to money received by the crofting communities
434 of Lewis from other than 'productive' sources, figures have kindly been made available regarding three sources, namely, (*a*)
436 Allowances made to members of the Forces and their dependents, and Pensions, (*b*) Unemployment payments, and (*c*)
729 Money Orders and Postal Orders. The yearly periods for which
434 figures are available are close enough to permit of reasonable comparisons. Among other sources, Bank Drafts form an insignificant fraction of monies received by crofters from outside
[505] the Island. It is impossible to say how much cash is brought home by men paid off from the Merchant Service and other
[464] employment, or how much may be sent through the post in the form of notes, whether registered or unregistered. The amount is known to be large, however, and an estimate based on the number of insured employed, and other figures, would be of value. A token figure is suggested in a note to the concluding Table.

427 511 Nevertheless, the attachment to the holdings is very real and must be given careful consideration when assessing their present utilisation and potential value. It is particularly significant because it leads to large numbers of tenants retaining holdings which are far too small to yield a living. Inevitably they seek other sources of income either at home [461] (as by weaving or casual road labour) or away (as in the Merchant Navy, armed forces, police or other skilled or unskilled work). As a consequence the croft is neglected and its potential resources, small as they are, are not realised. [231] The decline in cattle numbers since the late nineteenth century gives some indication of the scale of this lost productivity over the parish as a whole. This is the crofter's own loss. Individually one can appreciate the problem - "four cows will not give me a living - better to get [745] work on the hydro-scheme and sell the cows". And when one hydro-scheme finishes another will take its place, or there will be casual road work or other labour and, betw times, the unemployment benefit which the self-employed crofter does not get.

Certainly the land is of poor quality, the climate in some respects severe, and the cost of transport, from Uig even to Stornoway let alone to the mainland, a perpetual pro [421] lem. But the root of the problem is the small size of most of the crofter-holdings, on [181] the one hand, and, on the other, the importance which most crofters attach to the posse sion of a holding, no matter how small and how neglected it may be. How has this com to be?

TABLE 5

TRADE AND INDUSTRY

the nature of stopgaps in the younger, formative years and do not offer progressive training for the eventual chosen career. As an example of this, a number of island girls come to Stornoway to work in local shops and then leave the island after two years or so to take up hotel work or nursing on the mainland; many boys leave the island for apprenticeship training in trades which now require evening-class, day- or block-release educational classes. About fifty young persons leave the island each year under the Training Allowances Scheme of the Youth Employment Service, which financially assists them to live in lodgings while working away from home.

Most of the employment categories in the island of course employ less than a handful of people, either full-time adults or time-serving apprentices; they are fully staffed very quickly and opportunities arise only when an employee dies or leaves the island, or—more rarely—when an increased demand for a service (for instance television engineering at one time) creates vacancies for apprentices.

COMMUNICATIONS

sold, one such causing legal history. The chief garage proprietor in the town applied to use for his business a site he had purchased at a road junction near the western end of the town, close to the principal new housing schemes and opposite the main gate leading into the Castle grounds. It was a mistake in planning, and public disapproval began to make itself felt. The Trust, in an effort to redress the situation, sought to distrain the garage proprietor from extended use of the area. The parties went to law, and the case was fought through the courts until, in the House of Lords, the Trust finally lost and had to pay a bill of some £4,000, equivalent to a fine of £4 to £5 from every family in the burgh. The Trust drew its lesson, and since has formulated a more alert and constructive policy.

The town is well served by its shopping centre, with multiple stores jostling for custom with smaller private business concerns. Prosperity for all, however, depends on the well-being of the Harris Tweed industry. If there are recessions, as there have been in the past, the tills rattle spasmodically. Also standing to suffer are others such as the bus companies (who provide the efficient town services and link up Stornoway with the rural areas), the builders and the haulage contractors. In the ever-present climate of unemployment it is the policy of the mills to employ male labour, despite the fact that women would be cheaper. The mills, run by natives or by Lewis-born incomers of the second and third generation, realise a social obligation in recognising that in Lewis the strong tradition is that the man should be the head of the family in every sense. The mills also carry a proportion of surplus labour to offset the unpredictability of those workers who, with crofts to look after, occasionally have to take a day off 'at the peats' or some such activity. This is another of the island's distinctive traditions.

On Cromwell Street is the shop of James MacKenzie & Sons Limited, dealing in hardware, furniture and china. Nothing unusual in that, at first sight: yet it is another unique aspect of life in Lewis, being conducted as a charity for the benefit of, among others, the aged and infirm persons of Stornoway. The business was established in 1830, on its present site. In 1964, the then principal shareholder presented the building and the business as a

A HARRIS VIGNETTE

has direct or indirect communication with Glasgow, Stornow and North Uist. In summer a thrice-daily bus runs to Stornow and once a day a bus makes the round trip of East and W Harris. The township, linear in pattern, east to west, includes s teen shops which cater for most of the needs of the populati within reasonable travelling distance; it also has two cafés, post office, a licensed hotel, a hall for social functions, masonic hall and two churches. The Sir E. Scott School here the only secondary school in Harris with an academic strea Most of the working population is employed in the service i dustries, the professions and the tweed industry. Tarbert was fishing port of some significance in the past, and is now a fuelling point for ships.

The absence of organised industry on a large scale, such Lewis has, is a factor which tends to bring nearer to reality a desire on the part of Harris natives to leave their native soil. The are small pockets of industry, but these are only dabs of easi ointment on the excessive unemployment sore of 27 per cent. T main occupation is of course crofting, the income from it bei augmented from a variety of sources. Some crofters concentra on the production of Harris Tweed, perhaps using the wool fro their own sheep; the natural dyes from the lichens which gro on the rocks and from other plants are still used occasionall Others specialise in knitwear. Recently shell-craft and wood-tur ing have been added to the traditional crafts, with a view to t tourist market. Fishing, of course, plays a part in the economy some communities. The interest of such organisations as the Sco tish Country Industries Development Trust has been conce trated on the potential in shell-fish processing, and the productio of knitwear on a larger scale than exists at present. Roa work gives employment to about thirty men, but is of cour seasonal.

An apparently bright light on the employment horizon showe itself in 1965, with the opening of a quarry at Lingerbay. T mineral quarried was anorthosite, a white granite used as a abrasive in cleaning products. A 99-year lease was taken out by subsidiary company of William Robertson (Shipowners) Limite Glasgow. But the quarry was closed in 1967 due to lack of order

A HARRIS VIGNETTE

Fourteen employees were directly concerned, with another six in the services sector.

The potential of the tourist industry is only beginning to be tapped. MacBrayne's drive-on drive-off car ferry, with a capacity of 50 cars and 600 passengers, makes two or three trips a day between Uig in Skye and Tarbert, the journey taking less than two hours. The mainstays of tourist accommodation in Harris are the Tarbert and Rodel Hotels, both well appointed and owning fishing rights for salmon and trout. Sea fishing is another tourist attraction. Crofters participate in the holiday trade by offering full board or bed and breakfast, caravans, caravan sites or vacant lets.

An interesting tourist venture has been started at Rhenigidale. A rough, stony track, one of the most tortuous and exciting in Britain, takes its leave from the main road over a ridge. It twists and turns in and out of gullies, over cliffsides and across the steep heather-clad slopes of the Toddum, a dramatic little hill of 1,730 ft which protects Rhenigidale village from the Atlantic gales. The seven-mile track is the only marked route, though crofters take a shorter way to the north over pathless bogs; the local postman makes a round of about 60 foot miles in the week, walking this track and on to Tarbert three times in all weathers. The village relies on its sheltered harbour with a good natural rock pier: most communication is by water, all food and fuel coming that way. In past times every household owned a boat for lobster and shell fishing to supplement both diet and finances. Today the interest in fishing has declined, as has the population. But in 1946 Mr Herbert Gatliff paid his first visit to Harris, discovered what the island had to offer, and started a campaign to convince hostelling interests of the need to make some investment in the Western Isles. A croft house in Rhenigidale was in 1961 equipped as a hostel, and under what is now the Gatliff Trust it is maintained for hardy trekkers, the Scottish Youth Hostels Association making a grant for running costs. Many visitors have found that the place offers a degree of happiness corresponding with its remoteness from civilisation.

HARRIS'S OFFSHORE ISLANDS

The small shop stocks essential household items, and extensive use is made of mail-order. A few years ago a telephone to the mainland was supplied, much valued in emergencies.

Scarp in fact has a small place of its own in the history of communications: on 28 July 1934 one of three British rocket-mail experiments (for which special stamps were printed) was held there. The inventor of the rocket, Herr Zucker, was later to become prominent in V-rocket work during the second German war. Herr Zucker personally conducted the firings. His rocket, a large cylinder with pointed nose, something like a heavy shell, was 3 ft long and weighed 30 lb, with capacity for several thousand letters. The motive force was ordinary high explosive contained in a large cartridge about 18 in long; the device was designed to burn with a series of rapid explosions and produce a flight speed of 1,000 mph. The firing apparatus was a flimsy wooden structure providing a runway rising at an angle from the ground, an elastic sling giving the rocket an initial impulse. The first rocket was fired on Scarp, to the mainland: it exploded prematurely and most of the mail was damaged. The postmaster applied to the backs of the damaged covers a three-line cachet in violet: 'Damaged by first explosion at Scarp—Harris.' In order that this mail should be actually flown, it was re-transmitted by the second firing made in the opposite direction, Harris—Scarp. The whole experiment was deemed a failure, however. The route taken by the mail addressed to Kirkwall was unique; rocket, ferryboat, motorcar, mail steamer, railway train, and finally by Highland Airways to Kirkwall.

Depopulation in Scarp was encouraged by the lack of employment prospects, and centralised education, of the type which has already played havoc with remote rural communities elsewhere, is felt to be a black cloud darkening the future. Much the same problem faces Scalpay Island, mentioned later. Children are removed from their home environments for higher secondary education at a central school: for Harris children this is at Portree, Skye. Many islanders argue that the scheme tends to destroy the family unit, urbanising the children so that they become unsuited to, and with no inclination for, rural life. Some sympathy must be felt for the education authorities, of course, as the pro-

The flesh of puffins, gannets and fulmars was the staple diet of the St Kildans; the oil and feathers were the vital exports that paid the island rent to MacLeod of Harris, the owner of the group. These exports also helped to pay for the purchase of such foodstuffs as salt, sugar and tea, and other items which the island could not itself supply. The St Kildans owned some hundreds of sheep, the wool being spun and woven into tweed, and a few cattle were also kept. But the seabirds were the foundation of the island economy.

The factor which led ultimately to the desertion of the island group was isolation. The community there was throughout its history undoubtedly the most isolated in the British Isles, though until the present century this mattered little to the St Kildans. All that was deemed necessary for the continuation of the community was that, once a year, MacLeod of Harris should send his factor over from Skye to collect the island goods that were to be sold, and to bring with him those provisions which would see them through another twelvemonth. However, as the demand for the island's products declined, communications became more important: to support the family a man had to leave to find work on the Scottish mainland. Large-scale emigration began in 1852 when thirty-six islanders (with State aid) left for Australia. Island life was punctuated by loss of life; boating disasters and cliff-falls in particular deprived the community of the vital male elements needed for survival. Tetanus infantus, known on St Kilda as the 'eight-days' sickness', strangled two of every three babies born; this disease ravaged the island for almost a century and again struck harder at the male sex. About 1810 the population was about 200, a definite overcrowding. By 1861 it had fallen to 78; in 1911 it was 80, and in 1921, 73. A decade later it was nil.

Isolation tended to make the St Kildans a human menagerie. With the improvement in boat services, St Kilda became a 'must' on tourist itineraries. The tourist trade took on an economic importance for the population after July 1877, when the *Dunera Castle* steamed north and west for a voyage to the 'romantic Western Isles and lone St Kilda'. The steamers continued to call throughout the three summer months annually for sixty years, their passengers eager to buy souvenirs: tweed, quern stones, spinning wheels, stuffed birds and eggs; indeed, anything to remind them,

the township; and to each were allotted the rights of the common grazing and the fishing grounds. For more than a century the croft has been held individually, though in the townships the common grazing is still held in common. Beyond these 'homely' limits lie wider horizons, in the past those of seafaring and of droving or the chase, and today of fishing and gillieing at home, or of ocean journeys, urban occupations or colonisation.

In the Lowland regions each symbol represents 100 holdings. For (A), 'mixed and dairy farming', the particular type of symbol shows the average number of workers employed on a farm-holding in each county. On each farm the employed workers form what may be called the 'Labour-Team'. A team may be 'small', 'medium' or 'large'. The Scottish averages of these three types (indicated in the inset key to the map) are roughly three, five and seven workers per team. Four 'casual' workers are counted as equivalent to one 'permanent' worker, but farmers' wives are excluded. Under (B), for the same Lowland counties and areas, full-time small-holdings are shown separately. The Scottish average of less than one full-time worker employed, most often a son or daughter of the small-holder, is typical of all the counties.

As to the relative importance of the different classes of farms and small-holdings in Scotland, true agricultural land-holders number 68,000, of which fully one-third hold part-time holdings (like the Island crofters), one-third 'full-time farms', and rather fewer (one-fifth) hold 'full-time small-holdings'. The remainder accounts for other types of less importance. The farms predominate in terms of improved land, full-time employment, and of course of production. As to area, farms cover 80 per cent of agricultural land. The farmers employ nearly 90,000 workers,

and with the addition of 10,000 workers on full-time small-holdings, these constitute a labour force of nearly 100,000. Nevertheless, there are more crofts than farms in Scotland, and more small (part-time) crofters than farmers, besides 'full-time small-holders', of whom so many are crofters, north of the Highland line. Thus the number of crofter families forms an important item of Scotland's rural population. Of these, the families of Lewis-and-Harris form fully one-fifth, owing to the remarkable growth of population until 1925. Even in the little burgh of Stornoway many families hold a plot of land, and at heart they may be almost as much 'crofters' as townsmen.

Socially, what is meant in the Island by the term 'crofters'? Although each Island crofter cultivates his own arable holding (his croft), he shares the common pastures with fellow-crofters, each having a right to a 'sum' of so much stock, 'his souming'. Open, sandy land by the shore, if any, may also be shared. These common grazings, shared together by the crofters of one community—a hamlet, a village or township—form a social link of great significance. They distinguish what we shall call 'township crofting' from individual holding, whether of part-time or full-time small-holdings, or of true farms. The common grazings, enclosed by line C (Fig. 2), thus form an important social index. About 75 per cent of the area included forms Common (or other Crofters') Grazings. The close dots of the dotted line divide the 'Commons' from Deer Forests, as in the Island and inland from the north-western coasts. Widely spaced dots divide the Commons from the Sheep Farms and other mixed holdings further south.

Outside the tract of 'township crofting' in the north and west, the chief unit of Scots rural life is the farm,

with its tied cottages and frequently a 'bothy' for the unmarried. Next to this comes the full-time small-holding, important in the North-east and the Southern Highlands of Scotland. Great as are the differences between these types of unit today, they go back, to a considerable extent, to common origins. The sites of the farms are ancient. And their people, though since divided into masters and men, are the successors to those who were once the 'kindly co-operators' of older 'farm groups', of Lowland *ferm-toun* and Gaelic *baile* (pronounced like 'ballie'). The island counterpart of these, and their life, will be described in Part Two. Hence, before we turn to further analysis of the Highlands and Isles, a word more should be said of Lowland types.

An important social index in the Lowlands of Scotland is the number composing the farm labour-team, averaged for each county. Villages and even hamlets are few, largely because farmers and farm servants live on the farms. Compared to those of most of England, Scots labour-teams are small. Yet, as the map indicates, there is a wide range from the 'large' teams of South-east Scotland, through the 'medium' teams of adjacent areas, to the 'small' teams of the West and North-east. Not only do the contacts of employer with employees partly depend upon the number in the team, but so do the farm servants' relations to one another. On the whole, the larger the team, the more formal its organisation; and the smaller the team, the greater a worker's own responsibility. The 'family farmer' of the West and North-east is often an ex-farm servant. From Burns's time, his character and enterprise have been recognised in Scotland, and in the last forty years have become well known in South-east England. But the isolation of these little farms brought its problems and its hardships.

174 The historical aspect of these regional facts is extremely
184 significant to the evolution of Scots social life, and to
179 developments of Presbyterian worship led by Elders in
55 ferm-toun and Kirk; although suggested by comparisons
128 throughout this book, they have still to be seriously followed
out. As to the future, regrouping of our somewhat
scattered agricultural population has been strongly urged
121 in planning for post-war housing and community life.
185 But sound planning must be based on survey, long overdue; though elementary, this key map appears to be the first of its kind for Scotland (Fig. 2). It is from these units of farm-team and township that Scots rural society must be rebuilt, region by region.

184 One further contrast between the farming and the
241 crofting communities demands attention: it lies in the
361 types of migration—one is tempted to say, of semi-
166 nomadism. Crofters, though they move to and from their croft and township—to the city, the sea, or the New World —return home to their native township when they can, and to no other. Many farm servants, on the other hand, though they usually spend their lives in the county or region of their birth, have been on the move from farm to farm, year after year. What is true of Lowland Scotland seems rather true of North-east England, but not of 'the
• [164] English Plain'. Unmarried Scots farm servants were hired for the half-year, and frequently moved after each new hiring, the married once a year. Families were annually uprooted—if indeed they could be said to strike root at all!
[122] The war-time 'Standstill' Order for Scotland began to
[178] check this migratory life; but its effects remain. Hence many men have few ties, their wives still fewer. The children could not grow up with their schoolmates: they could look back to no "Auld Lang Syne", of which the

CHAPTER NINE

THE ISLAND OF BERNERA AND ADJACENT DISTRICTS OF THE MAINLAND OF LEWIS

('Bernera and Bernera Shore')

by

P. Wheeler

131 Of the three main sections of the parish of Uig, the Bernera district, consisting of
103 Bernera Island (Breaclete, Croir, Hacklete, Kirkibost and Tobson) and the "Shore"
(Earshader, Crulivig and Lundale together with the isolated township of Linshader),
49 presents a number of peculiarities due not primarily to physical conditions, but to isolation.
Bernera Island, though central to most of Uig and easily accessible over the sheltered
waters of Loch Roag, yet remained relatively inaccessible overland until the recent
building of the road bridge; even now it is necessary to travel over six miles to get from
101 the bridge to the main Uig road and a further four miles to Garynahine. Consequently
the island, even more than the adjacent mainland settlements, has a very close-knit and
self-sufficing population. Whether this community retains sufficient vitality to resist
the destructive effect of better communications in addition to the general forces eroding
rural and especially Highland life, remains to be seen.

13 The district shares the unpropitious physical characteristics described in the Intro-
duction. Like the other districts it has virtually no valuable mineral resources (1), and
228 the herring and white fish industries have all but disappeared and seem unlikely to
171 resuscitated. Lobster fishing is, however, prosecuted with vigour and enterprise; it
464 provides a good living but only for a small group of families. The rest depend on
regular or casual employment to eke out the proceeds of the croft. The kinds of work
164 available, and the problems of permanent or seasonal absence in search of employment
are common to the whole parish; thus this account is mainly concerned with the problems
of crofting agriculture.

Settlement: history and patterns.

172 The pattern of settlement in this inhospitable and discouraging environment is partly
very old, and partly very recent. At least four brochs are known on Bernera and various
361 standing stones of even earlier date, while continuous settlement has survived from the
early Christian era. Traces of old patterns and practices remain, in tangible form as
17 in the graveyard on little Bernera, or in oral tradition. All this contributes towards the
very close network of family relationships that binds the island folk and to a lesser extent
those of the adjacent mainland.

175 With the exceptions of Tobson, Bosta and Breaclete, all Bernera Island had been
361 cleared by 1851. Resettlement began in 1878 when twelve families were moved from
Bosta to Kirkibost, and continued at Hacklete in 1880, and subsequently elsewhere.
Occasionally (as at Kirkibost) old, pre-clearance lotting patterns were re-adopted, but
usually settlement was laid out afresh. The townships of Bernera Shore, were also
affected: all the small tenants except those of Earshader and Crulivig were cleared,
leaving the land under the sheep farms of West Earshader and Linshader. However, the
Bernera Island crofters were allowed to continue their customary use of sheilings on the
mainland, and the transfer in 1880 of these grazings to their present position marked the

[3] (1) A small deposit of diatomite has been exploited in Kirkibost since 1959. Only a few
men are employed and the number is not likely to increase.

[TEXT CONTINUED ON PAGE 61]

231 [176] to less regular routines than was the case when the shielings formed an essential part of the grazing regime. The old "Black Cattle" strain is completely bred out, nor is there much trace of Highland blood. The cattle are almost exclusively of Shorthorn or of Aberdeen Angus or of cross blood.in order to qualify for the hill cattle subsidy. The exceptions, like the Jersey cow in Crulivig, are very few. The cows are dual purpose beasts, kept for milk and for production of calves for sale. The latter are sold either within a week or so of birth, or at the age of up to six months (i.e. in autumn) or at about eighteen months age, after which the regulations usually specify that followers must be counted as full-grown beasts in the soum. They may be sold either in Stornoway or at the biannual sale at Breaclete. Cows unless they are being passed on to another crofter, are usually sold to the Stornoway slaughter house. Again, owing to the restricte market available, prices are lower than on the mainland, though undoubtedly greatly improved since 1939.

The problem of winter feed is still a governing factor in cattle management: cattle kept through the winter need a good deal of fodder, and happy the crofter and fortunate the year when it is not necessary to buy in a certain amount of cake, bruised oats, other feed or even hay. However, it is generally reckoned that the croft will supply the most if not all of the hay and oats. In any case, the amount generally bought in is a great deal less than that necessary in the mainland Highlands. This is largely due to the fact that, on many days, the cattle can be let out for foraging and will, in fact, manage to gain some natural feed.

Here, in contrast with Sutherland (where frequently a bull upon a neighbouring farm is used for service), and even with Park (where each township has its own bull) there is but one bull. In order to get round the problems of maintenance which have occasionally bedevilled Lewis townships, there is a recognised practice: the bull spends July to October upon the Tobson township common grazing, and the rest of the year on Little Bernera.*

Horses have never occupied a very important place in the economy of the area. It is said that the first horse on Bernera Island was taken to Hacklete bout 1923: previous to that and for some time after, most of the cultivation was by hand. This is understandable: in an area where most of the arable land is in lazy beds, and where, owing to dependence upon and nearness to the sea, problems of long distance land transport did not arise, there was little place for the horse, a fact which was recognised by the omission of horses from all the soums save that of Linshader itself. There is no recollection in the area of the keeping of goats. Nor is there a tradition of pig-keeping, though there were undoubtedly a few kept in the past. Poultry are kept almost entirely for domestic use.

Population - ages and occupations.**

162 Questions of land use cannot be separated from questions of population. The permanently resident population of the Bernera region is but three hundred and sixty and it is not balanced as to age-distribution (see Fig. 30). Appendix C(3) shows that out of 85 croft-holders on Bernera there are 34 full-time crofters: 21 are men, only seven of whom are less than 65; 13 are women, only six of whom are less than 65. The situation is even worse on Bernera Shore: out of 25 croft holders, only 11 are full-time, all men 164 but all are over 65. The term 'full-time crofter' really implies crofter with no other occupation, and cannot be taken as necessarily involving a full-time unit of effective agricultural labour. Of the croft holders with full-time employment, 33 on the Island and six on the Shore, all but one, as would be expected, are less than 65. Therefore a large part of the active labour force is siphoned off into other occupations, for, increasingly, a man with a regular job has neither the energy nor the inclination to work a croft in

*The introduction of Artificial Insemination may soon change this.

**Appendix D(1) contains details of population by townships, appendices D(2) and (3) give further details of occupations and emigration.

TEXT CONTINUED ON PAGE 81

511 It is obvious that crofting no longer affords a livelihood in Aird; the only two families
464 without ancillary occupations are those where all the members are elderly. Of the others
288 with members in the working age-groups, five have one or more members employed in a civilian capacity at the R.A.F. station and there are five regular weavers.

621 Aird used to be a self-contained community; the land was fully cultivated and a certain
178 amount of fishing was carried on in spite of the difficulty of drawing up the boats over the rocky beach. Now it is prosperous, but very much dependent on the R.A.F. station, and if this should ever close down, most of the younger people would have to leave in search of other employment.

CHAPTER SEVEN

VALTOS, KNEEP AND REEF

by

David G. Symes.

131 On the eastern side of the Aird peninsula, facing east to Loch Roag is a secondary
133 peninsula of more moderate, but none-the-less broken relief. This, together with an adjacent area of the main peninsula, the islands of Pabay, Vacsay, Vuia Mor and several smaller islands, comprises the territorial limits of the townships of Valtos, Kneep and Reef.

133 This secondary peninsula is accidented in the extreme, with outcrops of bare rock and steeply angled small hills. The relief is greater in the west (summit 450') than in the east (summit 275'). Relatively level land is to be found only on the machairs of Reef and
133 Cliff (the latter only poorly developed) and on the glebe at Uigean. The Reef machair,
134 about 180 acres, consists of a succession landwards of tidal sands, a belt of sand dunes (c. 20' O.D.) and a sandy plain sloping gently inland towards a reed filled lagoon. The machair at Cliff is approximately 40 acres in extent; here there are fixed dunes and, in addition, the sand has been blown inland to at least 100 ft. O.D. Except where the machair sand has drifted upslope to produce a "brown machair" of mixed sand and peat, the thin soils of the Valtos peninsula are predominantly peaty. Although the length of the peninsula faces north the extremes of Atlantic weather are moderated by the protection afforded by the Aird peninsula and the islands of Pabay and Vacsay.

175 In the period before the lotting of crofts the whole peninsula was occupied by some five
427 clachans - Valtos, Cliff, Kneep, Uigean and Reef - some of which shared common pastures.
341 During the early part of the nineteenth century and earlier, apparently, than the 1850 lotting
[63] carried out in most of Lewis, crofts were allotted in each of the clachan areas: Valtos and Cliff shared a common pasture and so became one township; similarly Kneep and Uigean were combined.

175 In Kneep it seems that the croft boundaries were not accepted by the crofters. Certain
311 basic divisions between groups of crofts (usually three in number) are discernable today,
427 and within these basic divisions a certain regularity of distribution of strips persists, but

175 the crofts at Kneep are still highly fragmented: the fifteen
311 and eighty separate arable plots. The lotted crofts at Ree
427 land for a sheep farm. Plans to clear the remainder of th
[22] by the Fisheries Board because Valtos and Kneep were the
50 industry. As late as 1892 Valtos and Kneep had forty boat
[164] hundred and forty-five men. Valtos with thirty-two boats fisher-men was second only to Carloway as a fishing centr of the fishing industry, the population of Valtos and Kneep 1841 to 659 in 1891. Some, at least, of the subdivisions o Reef was scheduled by the Deer Forest Commission (1896) and in 1908 an attempt was made to do this, but agricultura the grounds of poor water supply, scarcity of arable land (c and the risk that, if cultivated, the machair would suffer w 1921, Reef was resettled by ex-servicemen from Valtos an
[233] farm was only carrying a stock of one hundred and seventy sheep stock in 1959.

427 Tables 15 - 18 summarise the more significant point
178 peninsula. Table 16 illustrates the fact that the economy is the total possible units are being worked. Many of the cro

(5) Stocking and cultivation by size of effective units, South Uig, August 1959.

Stocking is assessed according to proportion of the scum held, cultivation according to acreage of arable crops, i.e. excluding hay; some units are omitted for lack of data, (consequently totals do not correspond.)

	Percentage of total number of effective agricultural units								
	1.0-2.5 acres	2.6-5.0 acres	5.1-7.5 acres	7.6-10.0 acres	10.1-15.0 acres	15.1-20.0 acres	More than 20.0	All sizes	Actual number of units
Proportion of scum held:									
Nil	-	1	1	-	-	1	-	3	4
Less than 50%	1	8	5	3	3	3	2	26	40
50%-100%	1	6	9	6	5	1	5	32	50
100%-200%	1	8	5	6	6	3	2	31	57
More than 200%	-	4	1	1	2	1	1	8	13
All units	3	28	21	15	16	8	9	100	
Area cropped:									
Less than 0.5 acre	1	5	3	2	1	1	-	13	19
0.5-1.0 acres	1	7	2	-	1	-	-	11	16
1.1-2.5 acres	1	12	13	9	8	1	5	50	74
2.6-5.0 acres	-	5	3	4	2	3	5	22	33
More than 5.0 acres	-	-	-	-	1	1	1	4	6
All units	3	28	21	16	14	7	11	100	148

Owing to rounding, percentage figures may not equal totals.

** over 2 years

summer, were last used for cattle six to eight years ago by people in Brenish, but none are in use today. These shielings were at the western foot of Mealisval, only about a mile from the township. The Brenish 'distant' sheilings, about six miles to the south-east of the township across the mountains, were not used after about 1920, while the adjoining Islivig sheilings were last used in 1922. Mangersta may have had its original shielings to the east of Loch Melavat about a mile south of the township, but after obtaining the enlargement from Mealasta farm, until about 1939, sheilings were used in that area.

No peats are cut on the crofts; the peat-cutting areas for all three townships are near the road and in no case far from the township. The common pasture near the crofts bears evidence of former cultivation, but it is at least fifty years ago since crops were grown on it. At this time the townships of Islivig and Brenish were over-populated with many cottars living on the crofts and all possible land on the crofts was already under cultivation. Today, less than half this 'old arable' is being cultivated, and in several cases the land is used solely for hay and grazing.

There are now no thatched houses inhabited in the townships and most houses have kitchen and other extensions added. Some crofters have built concrete two-storey byres of modern design. In Brenish, where the hills to the east provide a good catchment area and the Brenish river a good source of supply, all the crofts have their own private piped water supplies, while in Islivig and Mangersta most crofts now have, or are getting, a water supply. All croft houses are supplied with electricity from the grid.

Commercial fishing has long ceased and as there are only three boats there is now very little fishing for domestic use, the principal use of the boats being to ferry sheep to the off-shore islands. Weaving is an important occupation. There are seventeen weavers - nine in Brenish, two in Islivig and six in Mangersta, and during 1959 they were kept busy; in 1958, however, few orders were received. Weaving cannot be said to bring in a steady income here, and some of the weavers, and others, find additional employment outside the township - this includes four men at the hydro-electric scheme at Gisla, three at Mangersta Ministry of Civil Aviation station, three at Aird R. A. F. station and at least one in the Glen Valtos quarries. In addition, one man owns a tractor which he hires out, and one, owning a lorry and van, does haulage work. Altogether, out of a total of twenty-seven men under sixty-five who do work, all but three (one just out of school and one a semi-invalid) have other employment in addition to their crofts.

The total population for the three townships is one hundred and twenty-one residents, and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are children of, or below, school age, forty-seven (39%) are in the 15 - 45 age group, 15 (12%) are in the 45 - 65 age group, and 31 (26%) are over 65. Of the resident tenants, thirteen are over 65, twelve under 45, and five between 45 and 65.

The relatively young population may help to account, together with the better soils, for this area giving an impression of a fairly prosperous crofting district compared with some of the others in Uig. Amalgamation of crofts into larger units has also gone further. The use of a tractor or horse for ploughing, extensive use of artificial fertilisers, the sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of people who are determined to make the most of their limited resources.

One enterprise, that of the Aird Bheag sheep farm, deserves special mention. Four crofters (three from Brenish and one from Islivig) have purchased from the Uig shooting estate about 2,000 acres of land on the Aird Bheag and Aird Moire peninsulas, five miles south of Mealasta. Here they are running a flock of about five hundred sheep. There is

233 hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

231 Parts of the common pasture - usually the machair, are set aside for wintering hoggs but the usual practice is to keep as many as possible on the croft. The soum as a whole
[427] is not enforced but shares in the wintering parks are adhered to. For example:- Timsgarry Glebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hoggs on it. In Ardroil one share allows one cow or four yearlings or eight sheep or eight hoggs
[232] on the machair - in practice it is the best hoggs that are sent. The minister at Timsgarry, who is much interested in sheep husbandry, has bred a heavier sheep with longer legs by crossing the Hebridean blackface with Swaledales and these seem to be doing very well; the minister is more attentive to his sheep than are many of the crofters, but some local crofters are showing interest in this crossbreed. The lambing percentage, so dependant upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.*

Enquiries show that some crofts in each township far exceed their souming but because others carry no stock the four townships are understocked according to the total soum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the sheep soum, Crowlista is overstocked by 130%, while the other townships are understocked.
[235] Some of the figures used for sheep stock were approximate or estimated. Nearly all crofts keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.[1]

241 Part of the hill common west of Crowlista was cultivated until the beginning of the
175 present century, at which time the township was overcrowded with two or three houses on
[361] each croft. A similar area west of Carnish was cultivated and old lazy beds, now grazed, are to be seen on slopes south of the road in Ardroil, in the valleys of Amhuinn Thoraghain and Allt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this area, still to be seen around and beyond Loch Suainaval were in use until 1934 - '35. (Figure 5).

464 Ancillary employment is sought by all but nine of the thirty men under sixty-five in these townships and the wives of two of the 'full-time crofters' have regular employment.
228 There is no commerical fishing by local boats though the Bernera lobster boats are seen frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port' shown on the O.S. map near the site of the clachan in Carnish, point to the former importance of fishing.

288 At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroil, three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were in use and two tweeds woven a week bring in a useful income but the supply of weaving is irregular. The future security of these weavers depends on the prosperity of the Harris tweed industry.

464 Mitchels's sand and gravel quarry at Carnish provides employment for from three to
[316] ten men. Five men from Ardroil and one from Carnish are employed there at present.
[712] The Aird R.A.F. station draws most of its civilian employees from Aird Uig but two
[377] Ardroil men work there. One Crowlista man is employed at the hydro-electric shcemo
[466] site at Gisla and this work will last for another year or two. Employers recognise the particular needs of their crofter employees and 'days off' are allowed for sheep fanks and other necessary work.

* The minister's ewes gave 103%.

1. [For Fig. 16, see page preceding p.38--Analyst]

As yet the tourist trade is almost entirely restricted to visiting relations but many houses offer suitable accommodation for people who would appreciate quiet holidays in these very beautiful surroundings. The distance from Stornoway, the difficulty of obtaining varied food supplies - and the weather - were cited as disadvantages! Passengers on a weekly coach tour from Stornoway are supplied with meals at an Ardroil house which has good access to the beach but otherwise the crofters show little interest in the possibilities of tourism.

In common with other crofting townships, the greatest problem here is that of an ageing population because the younger people seek employment outside their township. The diagrams[1] illustrate the age-heavy structure of the permanent resident group and also the numbers of the insurable population periodically or permanently away. The lack of suitable work, for young women particularly, is also shown. The ages of the tenants also illustrate this problem. Of the thirty-seven tenants here, twenty or 34% are over sixty-five. Serious, too, is the loss by emigration of people between fifteen and sixty-five. Of the total 'working population', 35% have left this region since 1939. The corresponding figure for Crowlista alone, the older settlement with smaller crofts, is as high as 42%.

We found in this part of Uig some crofts efficiently and energetically worked by young tenants, and if reasonable stock prices are obtained the larger crofts can be worked profitably. However no croft will fully support a family; ancillary employment is always sought by crofters with growing families yet many crofts are carrying less stock than they might because some tenants are not interested in, or able for, agriculture. The croft is increasingly thought of as a home, as part-time employment - often for older members of the family - and as a place for retirement.

It is easy to list schemes for improvement and change:- dairying to supply Stornoway with milk, poultry and pig keeping on a commercial scale, cultivation under glass, the tourist industry, forestry on a small scale, lobster and crab fishing, etc. Such schemes would require capital not available in the townships, careful planning, and tactful administration by people with real knowledge of this area and its people. Meanwhile even the potential production of the crofts is by no means realised.

CHAPTER SIX

AIRD

by

Madge Phillips.

The little township of Aird is an isolated and old-established crofting settlement along the western side of the steep and narrow valley of the Amhuinn Gil na h-Airde three miles north of Crowlista. After leaving Loch Meacheit, the river flows northward through a gorge (at the mouth of which are the ruins of the old corn-mill), then across a narrow flood-plain into the rocky bay of Camus na h-Airde. The crofts, roughly fan-shaped in arrangement and varying in size from 3¼ to 7 acres, each originally included a narrow strip of the flood-plain, stretching across from just beyond the right bank of the river, up the steep, rocky slope above the left bank and widening out over the more gently slopes between the 100 ft. and 200 ft. contours. A number of the crofts were subsequently enlarged, gaining extra land on the right bank of the stream, whilst others received additional ground to the north or south.

1. [See figures 12 (facing p.34) and 17 (facing p.39)--Analyst]

An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on the individual croft to the size of holding and to the availability and age of the labour force. In both diagrams there is a significant division between the subsistence holding (0 - 7 units) and the commercial holding (11+ units), but there is no definite relationship between stock and size of holding or labour availability. The inclusion of the points of equilibrium for certain lines in Figure 20 reveals a somewhat unexpected state of affairs: in the case of crofters with regular work and full time crofters, those over the age of forty-five carry a larger stock from those under forty-five. It is frequently argued that the solution to the economic problem of crofting lies in the amalgamation of holdings in order to create a more viable economic unit, but the indication from these diagrams is that an increase in the size of holding will not, of itself, lead to an increase in stock. It is the absence of accessible markets that deter the crofter from increasing his agricultural production.

In their present state the crofts in the Valtos area are unable to provide a livelihood for the crofter and his family. Of the crofters under sixty-five almost 90% supplement the croft income by other employment. Of these casual labour (at present mainly at the Gisla hydro-electric scheme) accounts for 57% regular work - particularly weaving - 43%. The combination of crofting and weaving provides probably the best return for the labour: one crofter with a croft of 3.3 acres, carrying two cows, two followers and ninety sheep (sixty ewes) made the following estimates for 1958:

FROM THE CROFT:	
Sale of two year-old calves	£80
Cow and calf subsidies	£40
Sale of wool at 4s. 3d. per lb.	£75
	£ 195[1]
FROM WEAVING -	
at two tweeds per week (32 hrs. p.w.)	£550
GROSS INCOME	£745

Weaving abour 30 hours a week apparently leaves him sufficient time to run the croft efficiently; at present a crofter supplementing his income by a labourer's wage at Gisla hydro electric scheme would have to put in nearly sixty hours per week to achieve the same financial reward.

The economy of the Valtos peninsula has been changing, and contracting, for several years. The number of unoccupied crofts is increasing; commercial fishing ended at the time of the first World War; the shielings have been abandoned as summer cattle pastures. The Valtos shielings near Loch Scanadale were abandoned during the 1939 - 45 war, due mainly to the lack of manpower in the township, though some was used intermittently until 1953. The shielings of Kneep and Reef were abandoned in the late 1930's, at which time Kneep had some fifty milk cows as compared with fourteen in 1959.

[1] Against this figure, must be set the costs of production (i.e. fertilisers, new seed, winter fodder supplements, sheep dips etc.)

127 joint tenants of one have moved to Geshader while continuing to work the Ungshader land.
32 Another is preparing to move to Enaclete and yet another lives on a feu at Loch Chroistean
51 Cottage. At present, three working units remain. Enaclete consists of nine crofts with ten units, one being rented by joint tenants.

221 The rhythm of work is similar to that in other parts of western Uig. Potatoes and oats are planted in April followed by lambing and peat cutting in May. In June and July the sheep are shorn and subsequently sent to the common grazings. In August the peats are carted, once they are dry, by lorry direct to the crofts. Hay-making follows. The lambs are weaned in September, harvest is then carried in and tupping and statutory dipping take place in November. The sheep are then returned to the township grazing though the lambs
241 may be fed with hay on the croft. There is little regular crop rotation and only a small number of crofters seem to undersow oats, thus improving the quality of future hay crops. Gardens are not important and only provide for family needs but Caryshader particularly has a number, some growing flowers as well as vegetables. Fertilisers vary widely from croft to croft as well township to township. Enaclete potatoes are still grown near the shore and thrive on seaweed; those of Caryshader are usually fed on artificials.

231 Most crofters keep one milk cow with a calf; a few rear a young beast for the autumn sales in Caryshader. However, some now rely on their neighbours for milk in return for grazing and one croft has turned to goats, as giving less trouble. The bull for the whole district is a beef shorthorn and is kept on Geshader -Ungshader common grazing as it is completely fenced; and Geshader is responsible for its upkeep.

233 Lambing seems to have been generally good in 1959 but it was not easy to get exact figures. The Morsgail Estate and Gisla farm also run considerable flocks. The common pastures total 3,119 acres with an enlargement, formerly used as shielings, of 1,215 acres for Enaclete, Geshader and Ungshader near Loch Suainaval, and for Caryshader 88 acres
[314] on Floday island. The shielings have been disused since the war. Peat is normally cut to the west of the road but at least one elderly tenant in Geshader has kept a section of his croft for this purpose to save the effort of working further afield.

241 Generally speaking the land now cropped only represents one third to one half of that
178 worked by spade 20 - 50 years ago when the crofting population was larger and when much greater numbers of cattle were kept through the winter, thus requiring more potatoes and
231 more oats. The cattle numbers are much less than the total souming but sheep are in excess. In Enaclete, at least, overgrazing by sheep has caused a decline in grazing quality.

464 Clearly in these townships, apart from the very few crofts still fully cultivated, the means of livelihood is sought elsewhere. At present there are altogether fifty-three men in the working age group (15 - 64) in all four townships. Of these fourteen are away, nine permanently and five periodically. Thirty have regular or periodic employment besides crofting and of these seven work at Gisla on the hydro-electric scheme, seven weave, some of them part-time, four hire out vans, two do post-office work and others have varied occupations while only three are full-time crofters. At present there are few men in the Merchant Navy and fishing does not provide an occupation although many share rowing-boats in their spare time, and fish for domestic use.

162 The population as a whole is ageing and of the group between 15 and 64, forty-four
[164] (roughly 30%) work away permanently or have emigrated. It is noticeable that there are few crofts worked by people with young families

000 In conclusion it may be re-emphasised that the fate of the crofting townships depends more

1. [Errata: See category 116, (introductory p.v), for corrections--Analyst]

t is worth noting that the rental charged for the newly cleared farm of Garnish was - being £20 less than had been paid by the crofters. Thus it cannot be said that the r were evicted purely in order to obtain more rent. The proprietor must have been g a long term view, looking for land improvement rather than immediate gain. By 870's the farm rentals had increased by 55%, those of the crofting townships by only And the latter often remained unpaid.

Thus, whilst the farmers prospered, the tenants became crowded in their townships h were correspondingly less and less able to support their increasing numbers. crofts became so reduced that in an average year the produce of the land might keep ofter and his family for only six months; for the rest he had to find other means of ort. Fortunately, after the hungry years of the 'forties', fishing provided just this. ing in 1851, an annual migration began, first to Caithness and later to the whole east of Scotland and England. By the 1880's not only were most of the able-bodied young following the herring as hired men on east coast boats, but many of the women-folk, had learned gutting, packing and kippering from English girls brought to Stornoway he purposes, were also earning. This was summer work, and fitted well between -time and harvest. In the winter, small local open boats worked long lines for fish which were dried and salted for local curers as they still are today on the vegian coast. Between the 1850's and 1880's there was a "condition of plenty" in s "which would not have been credited by those who judged of the condition of the e by the external aspect or sanitary arrangement of their dwellings".[9] It was this dition of plenty" which encouraged the people to stay at home, to sub-divide their s, and to live on the proceeds of paid labour rather than on the produce of the croft.

ettlement, 1878-1935.

The process of sub-division ceased only when economic conditions became less rable and emigration began to exceed natural increase. In the 1880's fishing and ing suddenly became less profitable. Simultaneously, and given extra point by the cular distress of the time, agitation for land reform, and in particular for the f of the most congested districts, became a political issue. This began in Uig in when an attempt was made to evict 56 crofters from Bernera; hundreds of crofters ted by force and subsequently marched on Stornoway. They were well received by roprietors - who appear to have been unaware of the summary and inhumane be- ur of their chamberlain - and to the credit of all concerned the matter ended peace- But land agitation continued.

he position in Bernera was eased in 1878 when Linshader farm was deprived of the ownship of Kirkibost which was resettled by crofters from Bosta, the latter being the Tobson crofters as an enlargement to their pasture. In 1880 new holdings formed in Hacklete, which had been the grounds-officer's farm (but which, judging its population, had always contained a number of cottars or sub-tenants). The ng of Laimshader was probably returned to the Borroston crofters about 1886, having part of Linshader farm and, in 1891, six new holdings were formed at Lundale, part of the same farm. At the same period, under the new Act, the crofters of vlista, Valtos, and Kneep applied unsuccessfully for enlargements from the farms. uring the nineties the islands of Little Bernera and Eilean Kearstay were taken off hader farm and added to the townships of Bernera, and Valtos obtained Pabay Mor.

---

port....on the Condition of the Cottar population in the Lews. (C. 5265), 1888, p.4.

Unlike the mainland farmer, should an islander withdraw his store
432 stock from the autumn sale he cannot easily present it elsewhere a few weeks later; he
431 must keep it from the autumn until the spring, which will probably involve him in buying feeding stuffs out of his seriously depleted income. Many crofters suspect that their difficult position in this respect is taken advantage of by mainland buyers. Whether this is true or not the result is the same - the crofter is discouraged from raising stock.

433 Many crofters with whom we discussed this problem realised that, by fully stocking and cultivating their crofts they might double, or even treble, their income from agriculture. Some realised that sound management of a large unit, such as the amalgamation of two or three crofts, by sublets or otherwise, might yield a reasonable family livelihood. What they all stressed was the uncertainty - the uncertainty of stock and wool prices, the uncertainty of subsidies from year to year, the uncertain fortunes of their little packs of sheep and the uncertain effects of the weather on their hay and oats harvest. In other words they lack confidence - in both the cash reward for agricultural operations and in their own technical ability. Therefore they prefer to take a sure weekly income, however small, and to work their land at a low level of productivity.

000 Climate, soil, and insularity (to which must be added the particular isolation of south Uig and Bernera, even within Lewis) all present problems. But there is a tendency to overstress these difficulties and to use them as excuses, whilst failing to appreciate that
[430] they also offer certain opportunities. Many agricultural raw materials have to bear the cost of shipping from Glasgow or from Leith; the peculiar difficulties of island stock marketing have already been mentioned; but, equally, the Minch could and should provide a natural protection for island agriculture. Elderly milk and travel-worn fatstock, potatoes and vegetables, imported daily into Stornoway from the mainland, are a standing reproach to crofting agriculture. Crofters could produce most of this food and if they would they would be turning to advantage the disadvantage of insularity. Some will admit this, if pressed, but they will also rightly point out the difficulties. These are two-fold: technical (particularly in the case of legal restrictions on milk production for sale) and economic (the difficulties, or believed difficulties, of marketing). A few individuals, for example, claimed that it was not worth selling potatoes unless they received the full shop price: this is a stubborn and stupid attitude; and one is reminded of the crofters' long opposition to the introduction of the potato, nearly 200 years ago; a co-operative marketing organisation might help in this respect.

829 The crofters' attitude to innovation is all-important; new ideas, whether in agricultural practise or in marketing, require careful introduction and a good deal of fostering. The crofters' lack of confidence is a real factor and must be taken account of; it is not due only to the risk and uncertainty of markets, they also lack technical knowledge, even though they may have plenty of ability. Again, the prevalence of small units makes it particularly difficult to adopt innovations; a failure which might be negligible on a large farm can become a disaster on a croft. The crofter has not the resources of the farmer with which to experiment, nor has he been able to observe other
[654] methods or crops on other farms because he lives and works in a restricted environment, surrounded by fellows in like situation. The introduction and development of township re-seeding schemes by the Agricultural Advisers is an excellent example of how these difficulties can be solved. Good progress has been made since our survey. Because such improvements are communal they tend to add to the flexibility of the township structure; because they extend the grazing season in spring and autumn they tend to
[464] reduce the need for winter fodder and so to reduce the cultivation problem. Far more re-seeding could be done, particularly in South Uig and Bernera. Here the lack of local employment makes agriculture more important as a source of income than elsewhere and the need to improve the productivity of agriculture is both great and urgent if population is not to fall below the minimum level for maintenance of services. This special problem deserves special attention, by both local communities and by the authorities. If South Uig and Bernera could carry a further 800 head of cattle, which is no more than was carried in 1883 (and is still less than the soums), the problem would be well on the way to solution.

CHAPTER THIRTEEN

POPULATION AND EMPLOYMENT

H. A. Moisley

in so many other aspects the parish of Uig is characteristic of rather than of Lewis in particular. Throughout the Hebrides the aw a rapid rise in population followed, in the early nineteenth emigration and decline (Fig. 44). The growing population, troduced potato, found employment in kelp-making. Lewis made the Uists and such as was made came largely from Uig, i.e. uently, whilst the population of Barvas only increased by 15% hat of Uig increased by 58%, (c.f. North Uist 60%. South Uist migration reversed this trend in population after 1821 (Mull and Islay), and after 1841 (Skye, Harris, North Uist and Barra), a xperienced in Lewis except in Uig (see Part I, Figure 8). but not in the inner Hebrides, growth was resumed, to reach Uists) and 1911 (Lewis, Harris and Barra); Uig, alone of Lewis aximum population in 1891. Subsequent loss of population has , as may be seen from Table 46 and Figures 8 and 45.

decline makes Uig somewhat comparable with the Uists, where 1881, rather than with Barra and Harris, where growth con- may be connected with the vicissitudes of fishing, particularly in 1890's, the annual Fishery Reports comment repeatedly on the ng and of the dried white fish trade. Re-settlement of crofters on resent century again affords a parallel with the southern Outer th the rest of Lewis; as elsewhere, it failed to arrest the decline ut a re-distribution which afforded welcome relief in the more But decline still continues; the loss appears to have been around 0's (table 47) compared with 30 in the 1930's where there was some

[TEXT CONTINUED ON PAGE 140]

Employment - the search for work

121 464 166

When an island community outgrows the local intrinsic resources permanent emigration is not the only solution. It is one of the outstanding demographic characteristics of island communities that a proportion of the population seeks employment beyond the island whilst maintaining its island homes. We therefore classified the population, in the first place, according to whether it was:

(a) permanently resident in the parish

(b) leaving the parish seasonally or otherwise irregularly in search of work, and

(c) working permanently away yet without a permanent home except in the parish.

TABLE 53

Location of employment

162 166 469

	Proportion of total population: Resident:	Periodically away:	Permanently away:		
Uig Parish	83.7%	6.5%	9.8%	100% (2,652)	
Districts					
South Uig	87.7%(1)	3.1%	9.2%	100% (746)	
Bernera	85.2%	7.2%	7.6%	100% (460)	
East Loch Roag	81.3%	7.0%	11.7%	100% (701)	
Carloway	81.2%	8.6%	10.2%	100% (745)

Park	72.2%	11.0%	16.8%	100% (1,092)	(1958)
Point(Stornoway)	86.8%	2.3%	10.9%	100% (1,068)	(sample: 1960)
Harris(mainland)	80.8%	6.9%	12.2%	100% (2,768)	(1961)
North Uist	87.7%	2.3%	10.0%	100% (432)	(sample: 1960)
South Uist	86.0%	3.5%	10.5%	100% (3,690)	(1956)
Barra	70.6%	4.0%	25.5%	100% (1,906)	(1961)

Note: (1) Including at least 27 temporarily employed on construction work at the Gisla hydro-electric scheme, and 28 permanently employed at government sites (equivalent to 7.4% of the total population). Many of these men would otherwise seek employment outwith Uig.

On this basis some 16% of the population of Uig is periodically or permanently away. This may seem low compared with 28% in Park and 30% in Barra but, on the other hand in the Point district, near Stornoway, the proportion is only 13%, and in North and South Uist it is around 12 - 14%. In Harris (Scalpay and Bernera islands excepted) the proportion is 19%. Various factors influence this state of affairs; they may be summarised as the age-structure of the population, the relative viability of the crofts and the opportunities for local employment. Within Uig the situation differs from district to district; the particularly low proportion classified as 'periodically away' in South Uig was probably

[TEXT CONTINUED ON PAGE 148]

are time. In addition there are a few croft holders with periodic employment. orthy that the incidence of employment bears no direct relationship to the size ding - there is not, for example, a preponderance of holders of small crofts nanent employment.*

r, the croft holders are not the only source of labour: Appendix C(4) shows s a total force of fairly regular labour for the crofts amounting to 147, or than half the total resident population. Of these, 78 undertake regular employ- ave employment on occasion, and thus only 45 are full-time, of whom 25 are The forms of employment are indicated on Appendix D(2); weaving, with 49 gularly involved, is by far the most important single source of full-time employ- nly other being fishing (24 persons). Estate work (mostly gamekeepers, c. at Grimersta Lodge) gives regular employment to ten persons in the town- Shore. No other form of employment accounts for more than three residents and 65 years of age; the category 'casual' covers a variety of unskilled labour re five non-employable invalids.

0 households, out of 130, have looms. Yarn is distributed by the Stornoway for weaving on commission; they collect, finish, and market the cloth. Hand s all but died out and such yarn is more likely to be used for handknitting than ; at least one lady supplements her income in this way. There is some evi- Bernera weavers receive less work than those more accessible to Stornoway; for this may lie partly in individual contacts between weavers and producers, n the particular skills of particular weavers but transport is an important ch a small isolated group of weavers does not justify frequent journeys by the vans; in fact most yarn is put out, and tweeds collected, by a weekly carrier.

ll the boats returned were necessarily engaged in regular fishing. Nor is the of the catch shown necessarily attributable entirely to Bernera.

Note: this is an inevitable result of the rigid structure of crofter land holdings. I, page 30 and table 12. The age of the crofter, and his family circumstances ive.

28 434 South Uig and Park seem to suffer in the same way even though the larg mostly mills, endeavour to distribute weaving equally to all districts. earnings vary from individual to individual, according to the amount of also from year to year according to the fortunes of the trade, especiall export trade. A good weaver, in a good year, might earn from £400 t average weaver, in an average year in Bernera, probably earns betwee whereas in the Carloway district (more accessible to producers based i Shawbost), the comparable figure is around £400. Most weavers try t nections with several producers and this difference in earnings may be obtain additional work for 'small-producers' (i.e. tweed merchants wh own yarn), and those who do not.

228 [226] [433] Fishing has greatly declined since the late nineteenth century (table fish nor herring are of any significance, nor do Bernera men contribute the island's economy by working on east coast boats, as was formerly t Bernera has become one of the most important centres of Scottish lobst value of landings having increased from £983 in 1937 to £4,949 in 1956. locally owned lobster boats and others use the facilities at Kirkibost. generally have seven to a crew (c.f. the usual five in Sutherland) and w of the Atlantic coast and out to the Flannan Islands and St. Kilda. The lobster pots and may also catch ling; crabs are almost entirely ignore difficult to transport to the distant, mostly English, markets.

One very important factor in the present prosperity of the Bernera the Kirkibost lobster pond. This was built by a local crofter in the 19 during the war, and was afterwards taken over by the Crofters' Supply original proprietor is still employed whole-time in looking after the po the lobsters. There is naturally some loss of fish in the pond, and wh being obtained at Oban the local fishers feel rather disgruntled at their market here. Hence, if there is a good catch, say over 2,000 lbs to a good weather prevails, the lobsters may be taken straight to Oban wher local price may be obtained. The C.S.A. pay 2s less per lb than Oban cost of the upkeep of the pond, and the wages for two men with their bo experiment in flying lobsters direct from Lewis to Billingsgate, but the The problems of isolation here are very severe for the lobsters have to Macbrayne's steamer and by British Railways upon which there are no ved for the small quantities in question - a hazardous course for a high

Conclusions.

182 This part of Uig, therefore, has had a long and complex history of h exploitation, and adaptation. Much of the more recent part of this hist remembered and still plays a part in the making of modern decisions. ship and a common past is an important cement of society, for where n are so limited a mystique of other than a material type is necessary if its self-respect. 511 [181] However, the natural resources are indeed so limite self-improvement is extremely difficult. The egalitarian tendencies o crofting legislation are not now sufficient to resist the tendencies of the vent some of the crofters making adjustments in their holdings, but unf insufficient good land to allow much adjustment without a drastic reduct which would be equally damaging to the well-being of the local society. [246] that alternative sources of employment could easily be found - the isola the isolation from markets of Lewis itself, and the lack of local resour [288] [222] on previous occasions to defeat plans for development. Weaving is the means of supplementary livelihood, but it is too vulnerable to politics a is greatly decayed from its former dominating position; only agricultur and perhaps the greatest possibilities there lie in better standards of cu drainage and fertilisation), a better standard of animal husbandry, and But whatever developments are undertaken will need careful selection a results cannot be hurried but nevertheless something must be done soon is to maintain itself. This great and paradoxical element of the "crofti important here as elsewhere in the seven "Crofting Counties".

241 are usually all the potatoes. Between the road and Loch a' Bhaile and between the unmade road and Loch Shader on crofts 22 to 25 the land is probably more intensively cultivated than ever before, but strips now overgrown with rushes and coarse grasses, especially near the cemetery give an idea of the former extent of cultivation. The working of stripe nearer the sea is no longer worth the labour involved. Crofts 22 to 25 are further divided by the small Loch Shader; no. 28 however makes good use of a small alluvial flat at the head of Loch a' Bhaile.

[237] Artificial fertilisers are in general use together with lime and dung. However some crofts were using seaweed, in particular nos. 1A, 1B, 1C, 4, 5, and 25 - i.e. those crofts with easiest access to the sea. The seaweed is gathered in the New Year and [824] trodden into the ground in the spring and apparently gives excellent results, but too much [423] labour is involved in carrying it to crofts in the centre of the township. Forty years ago each croft had rights to the "red" and "black" seaweed along the coast.

The crop acreages for the whole township will be found detailed in Appendix C (1) The area of oats for each croft varied between 0.25 and 2.50 acres whilst the maximum for sown grass was 1.5 acres. The excellent crops of hay from sown grass would suggest its further extension, but unfortunately most of the land suitable for cultivation is already under oats and potatoes. The practice of undersowing oats was not particularly widespread whilst only two small strips of oats-rye mixture were found. One crofter had also obtained good results in a small patch with seven different vegetables, whilst soft fruits are to be planted next year. The two sets of 'run-rig'crofts practise a fixed run-rig with the usual rotation of oats and grass on the strips.

231 In cattle stock (Appendix C) the township has 28 three year-old beasts, 2 one year-olds, and 24 calves. Only 6 registered occupied crofts have no cow, two crofters have two cows each, and one crofter has two cows and two calves. The township has no [178] bull however and the nearest is at Carloway or Callanish. With a much smaller number of cattle than that of thirty years ago there is now no need to make the annual summer visit to the shielings, a practice which died out in Tolsta Chaolais between 1920 and 1930. Pastures could however carry three times the present amount of cattle. The souming 233 of 1 cow and 6 sheep per £1 rent is now apparently ignored. The approximate total of sheep for the township is 1,500 whilst for 1958 it was about 1,470. The total of lambs was approximately 520 but most crofters found it difficult to give an accurate figure since some might have been lost on the moor during the summer. The highest number of breeding ewes for any one croft was 112, of lambs was 34, and of other sheep was 26; five crofters, however have no sheep at all. Before 1939 a shepherd was employed by the township when the sheep were sent to the moor. The shepherd was usually a young boy just left school and was paid by each crofter according to the number of sheep the latter sent to the moor. This has been discontinued but a levy, of 5s. per croft and 2½d. per [231] head of sheep, is made for the upkeep of the township fence. Finally, almost every crofter keeps at least a dozen poultry.

221 231 233 The movement of stock over the grazing areas is summarised as follows:

(1) From November 13th to May 1st. cattle are usually in the byre, depending on the weather, and sheep can wander anywhere. Crofts should be open to common grazing unless all the crofter's stock remains within his own croft boundary.

(2) From May 1st. to May 20th. sheep are in the outer park.

(3) On May 20th. sheep are sent to the moor.

(4) Throughout the summer cattle are in both the inner and the outer parks.

(5) On October 1st. the sheep are brought into the outer park.

(6) On November 13th. the sheep are brought into the inner park.

464 Details of population and employment will be found in Appendix D. It is a very [463] striking comment on the state of crofting in this township that only four persons are

full-time crofters; 19 males have other regular employment and two have periodic employment. 8 crofters are aged over 65. It seems that the most successful combination of employment is weaving and crofting; weaving is carried on in twenty of the holdings. Lobster fishing in the evening is still popular but regular small-boat fishing has disappeared: one crofter took up regular fishing when weaving was slack in the autumn of 1958.

Of a resident population of 125, 32 males and 32 females are between the ages of 15 and 64, these representing the effective labour force. Thirteen persons are temporarily away and 16 permanently away whilst at least 46 have emigrated since 1939 and 6 have immigrated. Thus the number that have emigrated is nearly three times the number that are merely permanently away. With a population of 125 and an effective labour force of 64 to work 35 operative units Tolsta Chaolais would seem to be far from a dying township.

If not exactly progressive the township economy seems stable and moderately prosperous, in spite of the fact that the settlement is rather inaccessible, for the roads which join the Carloway-Breasclete road are both very steep and have bad corners. To add to the apparent isolation there is only one Post Office-shop in the village but most commodities are bought from vans. A reallocation of the smaller crofts to younger, more ambitious tenants at the deaths of the older tenants could reduce the number of operative units to about 25. Admittedly, little can be done with the rougher terrain, and although cattle stocks could be increased there would be the added problem of sufficient winter feed. With better drainage more land could be taken into cultivation - especially between the two lochs, an area largely wasted at the moment - whilst weaving might supply a surer source of income, especially in the winter. Tourism on a small scale might be a further possibility for the coastal scenery is very fine and the immediate setting of the village is very attractive. It would be more realistic however for Tolsta Chaolais to find future prosperity within its own boundaries.

at Carloway Bridge. In addition to the main settlement which is irregularly disposed on either side of the two roads, a group of Swedish timber (joyce) houses has been built in a somewhat forbidding situation on the common pasture adjoining the 'Pentland' road.

The thirty three registered crofts and thirteen feus or allotments (of which only five are non-agricultural) are worked in thirty four units. Three of the tenants of the Swedish houses have crofts, two in Knock Carloway and one in Upper Carloway.

The land use figures show that Knock Carloway has a much greater percentage of permanent grass than has Borrowston on the opposite shore of the loch. These figures reflect not only the less rewarding physical environment on the south shore, but also the lower intensity of cultivation which bears a direct relationship to the type, number and quality of the stock. The township has less than the total number of animals permitted by the souming though the higher figure for sheep than cattle reflects the general trend for the area. No horses are kept but the township has the bull which serves the area - a privately owned beef-shorthorn.

Weaving remains the major occupation but the emphasis is less heavy than in the other townships for the community services centred here employ a number of the inhabitants. It may be that here lies part of the answer to the problems of the community as a whole: but even if employment in services were to be increased it could never be very significant in a district with total population of only 600.

KIRIVICK

Adjoining Knock Carloway is the small township of Kirivick which has forty one permanent residents. It occupies the least rewarding agricultural environment of the area. Crofts 1 to 13 rise (from the shore of Loch Carloway on the broken hill face to the Carloway-Breasclete road, whilst number 14 occupies the head of a small valley which was once part of the common pasture beyond the road.

The houses are set back from the road occasionally sheltering in the lee of the frequent knolls of bare rock which are exposed on the croft land. These rock surfaces together with the irregular deposition of the drift account for the fragmentation of the cultivated strips in small hand-dug lazy beds on the upper parts of the crofts inaccessible to the tractor.

There are fourteen crofts, three feus and one squatter settlement and all but two of these are fenced. Two of the crofts are held in 'fixed runrig' and the small sections in which the land is cultivated are shown in figure 41, which also illustrates the regular distribution of sections between the two. Though it used to be the normal practice the crofts are not now open to common grazing in the winter.

The restricted amount of land available for common grazing ensured the continued use of the shielings until 1939; small patches were cultivated on the common grazing about forty years ago and this fact too is the only recorded instance of a practice that was a community by the size of the working unit and the land available. At the moment there is no proposal for reseeding of any part of the common pasture* because of the difficulty of getting access for tractors. As in the case of Knock Carloway the total souming is not exceeded, but the sheep stock is 25% above the sheep soum.

The population figures emphasise the problem of the whole of this southern area and here is the most extreme case of incipient decline. There are two fulltime crofters, six crofters who weave and five crofters over sixty five. Seventy per cent of the population is over 45 and only two children attend the school neither of whom is likely to take up crofting.

1. [Figure 42--Analyst]

Little close attention is paid to shepherding though several crofters profess to liking it. The great losses on the moor (often amounting to one third of the lambs each year) does not seem to cause much worry. The chief income from the sheep is the fleece which sells at up to 4/- per pound, an average fleece weighing from three to four pounds. This wool is not used for the tweed industry since it is too coarse being more suited to carpet manufacture. Appendix C (6) shows that the majority of flocks are small averaging from 10-20. The overgrazing is the result of a smaller number of owners keeping larger flocks. Thirteen of the working units have between 50 and 100 sheep. As to those without sheep, several crofters declared themselves to be too old to bother with them, a fact which serves as an illustration and introduction to the population problems.

Appendices D (1) shows the twofold nature of the difficulties which confront the community. Twenty-two per cent of the residents are over 65 years of age and no less than 56% are over 45 years old. With the sole exception of one man who works on the power development project at Gisla in South Uig, the main focus of employment is local. A small number of people are engaged in services to the community including shopkeeping, but the main source of income is weaving since crofting itself (by definition in this area at least) does not yield sufficient to maintain a family. Yet there are 31 full time crofters who are being supported in some other way, either by relations temporarily or permanently absent or by interest on capital accumulated during periods of employment away from the island.

There is an insufficiency of women of child-bearing age to offer hope of an increase in the population or even a sufficient number to guarantee a level of replacement. This fact together with the emphasis on one form of employment gives rise to anxiety among the crofters, who recollect what happened when the fishing finally collapsed during the First World War after a period of steady decline. In 1913 twenty boats sailed from Carloway and gave employment to 295 men. If the weaving fails (at present a weaver making three tweeds per week can earn up to £16 for them) there will be similar hardship and the net emigration from an area already none too attractive to young people will certainly become more marked than it is at present.

** two years and over.

eggs are needed in maintain the flock because casualties, from disease and accident, are heavy. Wedders are also kept, until they are two or three years old, when those that survive are supposed to be good for the pot. Again, after allowing for casualties and home consumption, the surplus for sale is generally small, except from a few exceptionally well-managed flocks. Likewise, the crofter who weeds out his elderly ewes is almost unknown; one man, indeed, claimed with pride the possession of a fifteen year old ewe! Thus it is certain that, after allowing for household consumption, very few of the little flocks of sheep yield an economic return for the time spent on them. The ideal arrangement would be to replace the 500 little individual flocks by about 50 communally owned 'club-stocks', each with a paid shepherd. This could almost certainly be financially more rewarding but would probably be socially unacceptable because so many crofters are deeply attached to their small packs of sheep.

TABLE 41

Stock carried (as a proportion of sound) according to size of units

	Percentage of Units according to size: 0-2.5 acres	2.6-5.0 acres	5.1-7.5 acres	7.6-10.0 acres	10.1-15.0 acres	15.1-20.0 acres	more than 20.0 acres	UNITS OF ALL SIZES
	%	%	%	%	%	%	%	%

More than 200%		12	5	8	6	8	3	8
	100	100	100	100	100	100	100	100

Table 41 has been constructed in an effort to discover whether the size of the working unit (which is greater in the southern districts) has any notable effect on stock carried. Further details will be found in appendices A(5) and C(5). It is clear that the size of the unit has no influence on the stock carried.

Finally, we may examine the stock held according to the age and employment status of croft workers (Table 42). Apart from a natural tendency for persons over 65 to keep no stock, the status of the croft worker appears to have little effect. Whether a crofter has regular, or only casual employment does not appear to influence the amount of stock which he carries. The proportion of "croft workers under 65 with no other employment" carrying no stock may seem curiously high until we recall that many of these persons are elderly pensioners or invalids.

Labour - who are the agriculturalists ?

When we recall (Table 12, page 28) that 16% of the crofter tenants are absentees, that 34% are over 65 years of age (of whom 8% are women), and that a further 7% are women under the age of 65, it becomes clear that many of the tenants cannot reasonably be expected themselves to provide active labour for agricultural operations. An attempt has been made to analyse the agricultural labour force; this must be treated with some reserve because it was necessary to decide for every effective agricultural unit, who was the principal croft worker. In some cases croft work is shared by a younger and an older man, the former having a regular job (often weaving) but being available for the heavier work, whilst the older man keeps things going from day to day. Women, even the elderly, often provide an important subsidiary source of labour, too. Where two persons were shown on the croft record as sharing the work of the croft, the older, if over 65, was ignored. Thus the analysis probably under-estimates the part played by elderly persons. Nevertheless the results (Table 43) ; two-thirds of all effective agricultural units are worked by crofters having other

employment and, as we shall see, in most cases, the croft carries so little stock that it cannot be the most important source of income.

This situation does not vary very much from district to district (Table 44), except that South Uig has a noticeably high proportion of elderly croft workers. This is to be correlated with the unsatisfactory age structure of the south Uig district which, in turn, is probably a reflection of the poorer employment opportunities there and consequent emigration. Weaving, in particular, is less important than elsewhere. This situation is also reflected in the smaller proportion of crofters with regular employment and the larger proportion which relies on casual employment as shown in Table 44.

Finally, we may enquire whether the size of agricultural unit available to a man has any influence on his employment status. To this end status has been plotted against size

The search for employment

a temporary feature in 1959 due to the casual employment provided by a hydro-el
scheme at Gisla (Figure 46).

In this respect the critical age-group is 15-44 years (table 54). Few older p
take work away from home. Of this age-group, 338 (out of 931) persons are awa
Women account for 199, men for only 139; the difference is a strong indication o
lack of employment opportunities for women in Lewis. The contrasting experien
the different districts are quite remarkable (figure 46). A far greater proportio
goes away from the two northern districts than from Bernera and the South, and
despite the greater importance of weaving in the north. The explanation for this
partly in the generally smaller size of crofts of the north, partly in the type of em
ment available locally and partly in the customary choice of employment away, w
differs from district to district. Social custom, which may vary as between one
and the next, has a strong bearing on whether and where young men and women c
work.

of unit; the result (Table 45) does not suggest that the possession of a large agricultural unit encourages a man to become a full-time rather than a spare-time agriculturalist. Indeed, the possession of a large unit, built up by amalgamation, is often a fortuitous result of marriage, death, or inheritance, rather than a matter of individual choice. The only significant correlation in the table seems to be the understandable tendency for female croft workers to work the smaller, rather than the larger, crofts.

2]

41 The cultivated land

11

31

The chief crops are hay, oats and potatoes, in that order:

DISTRICT	Acreage of: Oats	Potatoes	Hay	All Crops	Average per unit

Table 55 and figure 47 summarise the main sources of emplo engaged in 'croft-work only' may be briefly dismissed. A large are elderly or otherwise infirm; a few are pensioners (e.g. reti men); very few indeed are fully occupied in the agricultural wor 'full-time crofters' is a misnomer in this area.

The most important category, in all districts, is 'croft-work relatively far less important in the south where there is corresp on other forms of regular employment or on periodic work, i.e. difficult to overestimate the significance of weaving in all distric stantial source of income in the parish and it should be clear fro that weaving is not an ancillary occupation to croft work except i The weavers are not 'crofter-weavers' so much as 'weaver-crof tion between Carloway and the rest of the parish is that, wherea young mens' work, the great majority being under 45, in the Car the weavers are over 45. The historical reason for this may be weaving into Carloway than elsewhere for, although some weavin throughout the area, it only became a major source of employme the last 20 years or so. Thus few of the older men in the south were young. A corollary is greater dependance on the Merchan employment for young men from Carloway than for those from th

Other sources of regular local employment are lobster fishin keeping and other estate work (Bernera shore and South Uig), an ments (South Uig). In addition there are the usual services - po

Figure 68
151
Population by age groups and place of employment

Although the croftland is individually held, individual control of the crofts only applies for six onths of the year. After the harvest, the croft land reverts to common grazing and the whole wnship stock graze indiscriminately over the crofts. Thus basically the whole area of the wnship, the individually held crofts and the common pasture, is common land, and it is clear at the agricultural revolution with its system of enclosure has not yet fully refashioned the Crofting rea.

Before 1900, there was a third element in the crofting landscape, the shieling (Gaelic - 'airigh'). e sites of the shielings are usually on slopes commanding a view of the surrounding area near a ring or stream and usually two to nine huts belonging to the same township are grouped together a site; isolated shielings are rather rare. In order to conserve the pasture within the township ke for wintering and to protect the unfenced crops, the cattle were removed to the hill early in ne, and the younger members of the households went out to live in small stone or turf-walled ts to tend the cattle. The milk was either carried back to the township daily or made into butter cheese at the shieling. The distance of shielings from the crofts varied from one to five miles Park.

The affairs of the townships are managed by the Grazing Committee, elected triennially by the wnship and presided over by the Clerk of the Committee. The duties of the Committee in st related mainly to the enforcement of soumings, but are now reduced to the disbursement of bsidies, although responsibility for the maintenance of the township dyke and the care of the wnship bull (usually lent by the Department of Agriculture but sometimes communally owned) are o the province of the Committee.

The layout of the townships varies with the topography but the majority of the crofts are aligned strips from the moor to the sea (figures 4 and 5). Most croft houses are built on the crofts; in rmer times, the majority of the houses were sited on the poorest part of the croft as all the itivable land was required for crops, but nowadays the houses tend to be sited near the road.

The official pattern of crofting is thus one of tenants, each living on his or her croft and sharing the rights and duties of the township. Table I gives an analysis of the tenants of the 215 Park ofts. It will be noted that only one-fifth of the crofts are tenanted by those in the 15-44 age oup: a similar proportion are tenanted by those over 65 years of age. Absentee tenants account 14 per cent of the total. Women form under 10 per cent of the total, but only one in seven of women tenants is the sole labour force on the croft. The intrinsic worth of the holdings can be erred from the fact that two-thirds of the male tenants in the insurable age group take supplentary work, two-fifths of them furth of Lewis. With such a large proportion of the tenants either ly employed in ancillary occupations in Park or elsewhere it is hardly surprising that the theoreal township organization exists mainly in name alone.

Each croft, however, is not necessarily an agricultural unit; some are sublet by absentee ants or by tenants who are too old or too infirm to work their crofts. Of the 215 crofts, one-fifth wholly or partly sublet. In addition to the legal crofts, there are unofficial holdings which fall o three categories, cottars, squatters and feuars, all legally without grazing rights. A tar[1] is a person, usually a close relative of the tenant, who builds another house on

These are the de facto definitions. Section 34 of the Crofters' Act of 1886 defines a cottar as follows:- "Cottar" means the occupier of a dwelling-house situate in a crofting parish with or without land who pays no rent to the landlord, as also the tenant from year to year of a dwelling house situated in a crofting parish who resides therein, and who pays to the landlord therefor an annual rent not exceeding six pounds in money, whether with or without garden ground, but without arable or pasture land". For fuller treatment, see Scott, J., "The Law of Smallholdings in Scotland," 1933, pages 152-155.

There is no legal definition of a squatter, and the above definition does not include any distinction between houses built on a croft and houses built on the Common Grazings.

In order to work such a croft efficiently, the tenant could not take regular ancill
and would require the assistance of his family at busy periods. If such holdings we
particular township studied, the number of crofts would have to be reduced to almos
present total. Considering Park as a whole, the agricultural units would have to be
half of their present number but this latter figure is only very approximate as it wa
general evidence. It is clear, however, that about 100 viable agricultural units cou
the present crofting area of Park.

000 From a detailed study of the agriculture of Park one can only conclude that the p
situation is far from being an optimum one. Only reorganisation on a major scale c
crofting economic, and such reorganisation would have to be coupled with the develo
crofting sector of the community dependent on ancillary industry. The prospects f
ancillary industry are discussed on page 12. Larger crofts might well evolve as
continued depopulation. In the meantime, a determined effort could be made in the
seeding and pasture improvement, and in consolidating the existing non-adjacent pie
crofts. A reduction of the sheep stocks, with an emphasis on quality instead of quan
introduction of more cattle, narrowing the present 1:25 cattle-sheep ratio, are poli
be followed with profit.

ANCILLARY OCCUPATIONS

464 In most crofting areas, ancillary employment is necessary to compensate for th
income: total dependence on the croft for a livelihood has never been characteristic
[161] areas except in times of privation. At the time of the abolition of run-rig, most cr
[162] a greater population than the land could support, even at subsistence level, and as
estates, crofts were created smaller than the optimum size in order to give as man
possible a share in the land. First the kelp industry and at a later period fishing,
464 divisions of crofts, already too small, and the establishment of a cottar and squatte
228 the case of kelp, the landlord required as many hands as he could muster and in the
423 fishing industry, the land was a secondary consideration as meal could be bought wi
241 of the catches.

161 In Park, it is noteworthy that the most congested areas in 1883 were the fishing
162 that since 1901, when the decline in the fishing industry began, these townships hav
464 rapid depopulation. No other home-based ancillary industry has successfully filled
economy. In Park as a whole only 18 per cent of the total male population of insura
full-time crofters today - a striking confirmation of the fact that ancillary employm
000 However, not all such employment is available in Park: 47 per cent of the insurabl

/p. 10-A/

[Kershader]

233 (b) From New Year to mid-April most sheep are kept on the common grazing. Practices,
311 however, are irregular; some flocks are usually hand fed, others only rarely. In the f
221 case they heft near the upper limit of their home croft and remain fairly close at hand.
231 Most crofters hand-feed their lambs, probably housing them at night, allowing them hay in the morning and turning them on to the common grazing in the evening. All this naturally depends on weather conditions.

(c) From mid-April to May, lambing takes place on home parks.

Most crofters let their ewes-with-lamb out at one date.

(d) At the end of June, gimmers and wedders are clipped.

(e) In mid-July the ewes are clipped.

(f) The lambs are weaned in the first and second weeks of August.

(g) The dipping takes place in October and the rams are brought on the crofts.

432] There is no general sale time, sheep being sold or slaughtered at all seasons. There is no club stock, but all but one of the Kershader crofters, along with crofters from neighbouring township take full advantage of the arrangement, first established in 1941, to graze sheep at 2/- per shee and 1/- per lamb in Park Deer Forest. Hence irregularities of rhythm are introduced or exaggerated.

231 Sheep are not particularly profitable: in general, wedder fleeces give 3½ to 4 lb, ewe fleeces
236] about 3 lb, and the wool is sold to the Stornoway mills and to the Wool Marketing Board. Avera
435] sheep carcase weight is reckoned to be 41 lb. and the price rarely rises above £3 and almost never above £4. Braxy and fluke are kept under by medicaments but remain potential dangers; 'Black leg' is still a serious problem. Many sheep are drowned in the bogs in Spring and late snows (1955, 1958) are disastrous for lambing.

141 Under-employment is a serious problem in Kershader. There are nine males classified as
61 full-time crofters, but probably only four of these (two on one croft) are in fact in this category,
62 and of the total of thirty males with their homes in Kershader, only fifteen of the insurable
67 population are permanently resident. There are twenty-eight females with their homes in this
66 township, but on only six crofts do any of twenty permanently resident females help with croft
64 work. Local ancillary employment consists of weaving, fishing (for domestic consumption
63] only) and work on the roads. Boats, one with outboard motor, are owned by three crofts. The
01] only resident professional worker is a nurse. Ancillary employment must be, and is, sought away from the township. As a result, of the 73 persons recorded as having migrated since 1939 or as being resident, periodically away and permanently away in 1958, 19 have left the area for good, 4 are permanently away, 8 periodically away, and only 43 are resident. Only one person entered the township since 1939. The age structure of the population, too, is far from the
75] optimum. The school in Kershader, which had 20 pupils in 1873, reached a peak of 110 in 1907
98] and declined to 28 pupils in 1953, now has but 17, although it serves Caversta, Garyvard,
71] Kershader and Habost. Maximum population was attained in 1881, but the total remained fairly constant till 1911, after which decline was marked. Since 1950 this decline has markedly increased.

82 It will thus be seen that the most serious problem facing Kershader is that of stabilizing the
41 population and giving it a stronger economic basis. Apart from the potential development of tourism, fishing, weaving and other home industries, the only possible occupation is in agriculture with perhaps a little forestry. Forestry, though important as shelter provision,
13] cannot be a practical proposition in large blocks or on a large scale, as it would dislocate the

[Garyvard]

1407 Only a fraction of the total arable land is cultivated by tractor and this is divided among seven crofts. In spite of an emphatic statement by one of these cultivators to the effect that he will never use it again, the use of the tractor will increase as soon as the pioneers are able to prove to their neighbours its capabilities and as soon as the lazy-beds are joined together, an improvement which has already taken place in Habost. The main objection to the use of the tractor by the disappointed user was the inevitable one that the yields were smaller than in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation, for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes
242 first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two acres of common grazing land by the road on the west side of the township, by nine of the crofters working together during the evenings. The work began early in Spring when 6 tons of lime, 10 cwts. of mineral phosphates and 8 cwts. of compound fertilizer were spread evenly over the land. The grass seed was sown in July, the most favourable time for sowing since there is less danger of a drought than earlier in the year, and more convenient too, in that the sheep had been gathered for shearing and 250 of them were available to be driven back and forth over the land to tramp the seeds in. In theory this land should be ready for grazing next Spring, but in practice it will be ready in November. It is planned to re-seed twelve acres in all.

Most crofters have a cow to provide milk for their own needs. The Black Poll bull at Gravir
231 is preferred to the other township bulls since its progeny command higher prices. Sales are held
234 in the district twice per year, once on the old lake-level on the east side of the township, and once
432 at Balallan. Prices for calves are normally better in Spring than at the Autumn sale, nevertheless
435 prices offered tend to be low. Even so, it is usually to the advantage of the crofter to part with the animal rather than bear the cost of taking it back to the croft and wintering it there. Naturally there is some bitterness that the middlemen who buythese animals will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but also at the local sales.

Crofting is not in itself a lucrative form of employment and in most households there is at
241 least one other source of income. A majority of the crofters have regular employment, two
434 working in quarries or on the roads for the County Council, another is postman, three are weavers,
463 another both weaver and contractor, while yet another works in Antarctic waters aboard a whaling
464 factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the an-
[238] cillary occupations, though the weavers are suffering at the moment from the slump in the Harris Tweed Industry which is also affecting the prices for wool. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set to
241 catch mackerel and other demersal fish. There is not one large fishing boat, however, partly
226 because of the scarcity of fish near the coasts, and partly because of the isolation of the area and
501 the subsequent difficulty in marketing. The Fleetwood trawlers are regarded as pirates in the
[228] Minch, and one has to its credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garyvard though it could be quite extensively practised.

The main road from South Loche to Stornoway through the village has obviously had a profound
361 effect on the township. The sites of the old 'black houses' have been abandoned when new houses
491 have been built, in favour of sites conveniently near to the road. The Road Age has greatly
[241] limited man's capacity for carrying goods. This is well illustrated by the fact that the majority of crofters in Garyvard use artificial fertilisers, whereas they are scarcely used at all in Caversta where the road ends about 50 yards from the nearest house.

[Caversta] [Cromore]

161 The 1914-18 war had a marked effect on the Caversta population - 16 out of 54 (29 per cent) left after
162 1911 and no re-population took place. Since 1939, seven people have migrated to Stornoway or the
166 mainland, (16 per cent of the total 1939 population), and six of these were from Torista (i.e. 50
167 per cent of the 1939 Torista population); only one family now remains there. The demographic position is becoming more acute for there are no young married couples and no youngsters growing
[466] up. The girls have left to marry and most of the men have sought temporary or permanent employment elsewhere, for with better communications, education and the radio, the pull to the towns has become stronger. There are now only two people in the township who could be described as full-time crofters, earning no supplementary income by weaving tweed on commission from the Stronoway mills.

Caversta is not one of the most progressive of the South Loche townships. Although the crofts
241 are fenced, the common pasture is not visibly delimited from either the Cromore or Garyvard
235 pastures. At present, the grazing is fully stocked according to the soum, but the committee has not
532 as yet initiated any re-seeding schemes. As the pasture is not of the best quality, some newly sown grass would benefit every crofter. Lack of manpower may in part account for this deficiency but even a small acreage of re-seeding would be a great asset.

000 The future position of the township is rather doubtful: it is not the best type of land for mechanization and is badly served by communications. The future of Torista appears to be probably one of abandonment, unless it is more easily linked with Cromore. The possibility of a good road being built here is remote, as there is only one family to serve. The main part of Caversta is also open to question. Amalgamation of the crofts would not necessarily make more efficient units for the present units are not used to their full extent. Amalgamation with Garyvard might benefit the township a great deal, as the Caversta population is rather small to flourish in isolation. The future of Garyvard, Karshader and Habost is one of hope, but unless some change takes place soon, it is not difficult to see Caversta, and Torista, following the same course as Calbost and in thirty to forty years being little more than grazing land.

CROMORE

G. Mary Swindell, B.A., and Dennis J. Fancett, B.A.

Cromore is situated on a peninsula between Loch Erisort and Loch Cromore. Approaching it
131 from the access road, Cromore has the appearance of a nucleated settlement, but in fact each
361 house is situated on the owner's croft. The crofts are so arranged that each has a portion of land on the more level surface of drift deposits; houses 1 to 20 stand at the junction of the drift and the
134 Lewisian gneiss. Soils are poor and thin, and there are numerous outcrops of barren rock amongst
137 the arable land. The natural vegetation is heather moorland with extensive patches of rushes and cotton grass, the pattern of most of the 'outrun' around Cromore.

The township comprises twenty-seven crofts and there are twenty-seven working units; two
241 crofts are subdivided while another four farm double crofts. In addition there are five cottars and
632 the Schoolhouse feu. Outside the township dyke there are two feus and four squatters. The croft layout differs from most other townships as each croft is in four non-adjacent pieces, one piece around the house, another above Creag Cromore and two pieces on another area of enclosed land on the common. Two crofts on the eastern side of Loch Cromore, have most of their arable land around the croft-house while three crofts have only one share in the other area of enclosed land.

Until this decade all the land around the houses, and much of that above Creag Cromore, was
241 regularly cultivated. Some of the lazy-beds on the higher land are being cut for hay this year but
311 cultivation is limited to the land around the croft houses and is completely unmechanised. The only
[246] crops at present are oats and potatoes and these are usually grown in rotation. The crofters sowed
[246]

[Cromore]

The crofters sowed
241 clover with their oats in 1957; the quality of most of the natural grass could be improved considerably
311 by extending this practice. Several of the crofters have taken advantage of the facilities for obtaining
246 lime and fertilisers, but seaweed and byre manure are widely used. Only seven crofts have
249 vegetable plots this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced
224 crops of lettuce, cabbage, turnips and carrots.

The souming for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not
221 enforced. The crofters keep the stock which they can manage to maintain throught the winter and
231 no one appeared to be dissatisfied with this arrangement. In fact the souming is exceeded by only
233 seven crofters and the total stock for the township is only 75 per cent of the soum. Lambing takes place in April and May and often a high proportion of ewes and lambs is lost. The sheep are
[236] clipped in July and each crofter usually clips his own sheep. He either sells the fleece or has it spun in Stornoway before weaving it himself. The lambs are taken from the ewes during the second week of August and then dipped; November is the tupping period and almost every crofter had his own ram. Most crofts have a cow and a calf and the crofters like the calves to be born in March so that they are six months old in October for the Garyvard sales. The cows are served by an Aberdeen-Angus bull from Crobeg Farm. The township gates are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on fank days.

Shielings, situated on the common grazing between Calbost and Cromore, were used until
178 the 1890's. Active land use has gradually declined; in the 1920's, much of the outrun was under
253 cultivation and from an an air photograph, it is evident that hay was being taken on the strips
311 above Cromore in 1946. The present trend is a continuing decrease in the amount of arable land but
[242] this year ten crofters formed a group to enclose and improve a ten-acre plot on the common grazing;
[249] it is unfortunate that all crofters are not willing to take part. Peats are now being cut near the road between Caversta and Gravir, about three miles south-south-east of Cromore and one mile north of Gravir.

Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore
171 fishermen work on other boats (one from Marivig and one from Stornoway) and there are a few men
232 who would welcome the opportunity to start fishing again. There seem little prospect of this,
[506] however. The landing-stage, completed in 1957, is regarded by many as a 'white elephant' and, in fact, at low tide it is useless. So much for the hopes that it might have been used by cargo vessels bringing goods to Park.

In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained by
298 road from two mills in Stornoway and one in Airidhvruach. At present the average production is
[493] only one tweed per loom per week but the weavers could quite easily double their production. During the past two years this industry has been comparatively prosperous. Knitting is a winter pastime
[236] but only for pleasure, although one household possesses a knitting machine.

In common with the rest of Park, Cromore has a high proportion of old people. Many from the
162 middle age groups have sought employment on the mainland, and the teenagers, many of whom have
166 been at school in Stornoway, seek jobs there or on the mainland, returning for holidays and assisting
167 with the croft work. Some younger folk are resident to care of aged parents.
164

Cromore is only eight miles by sea from Stornoway yet all communications with the town are by
491 road - a distance of thirty-two miles. There is a daily bus service and the sub-postmaster has a van
[499] which is occasionally hired. Some people recalled that the only route to Stornoway was once by
[493] boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the haulage in Cromore, particularly for bringing home peats during the summer. As a result of recent additions to the roads, only three crofts remain inaccessible to vehicular traffic. There are no
366 shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday;

[Marivig]

231 There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while
[235] all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

Peats cut on the common are transported by lorry to the crofts, while peats from the north end of
249 the peninsula separating Loch Marivig from the sea must be carried in creels.
252

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft,
228 and with this supplements the family food supply. One herring boat, operating nightly from Stornoway
301 and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the
363 roads while several men work partly on the crofts but are periodically away whaling in South Georgia,
366 fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual
367 migration from Marivig, especially of the young people, is reflected in the high average age of the
162 permanent residents, and in the numbers in the school -over one hundred pupils in 1900, thirty-nine (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young
271 people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

205 The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a
206 shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There
366 is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road
396 which reached the township from the west in the late 1920's has a tarred surface and is much
398 better than the later road southwards to Gravir which is untarred. There is no church in Marivig
261 and most of the population attend the Free Church in Gravir.
262

Within the township the two arms of the township road serve all but two of the crofts and the
363 sites of the newer houses, few of them more than thirty years old, tend to be near the road, while
61 the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain
42 and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron.
199 All the crofts are supplied with electricity from the grid, but very few have a piped water supply;
12 rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

129 The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the
00 crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

[Calbost] [Gravir] [Glengravir]

161 The present situation in Calbost is best illustrated by reference to the population statistics.
162 There are only 17 people living there at present, seven of whom are squatters and only eight houses are occupied within the dyke. Of the male population, there are three children under fourteen years, one man in the 15-44 age group, three between 45 and 64 years and two over 65. This clearly shows the lack of active men from 15-44 years, necessary for the continuing economic success of
166 the community. However, even these figures are not so striking as the numbers of emigrants as
167 no less than 39 men and 40 women have left Calbost since 1939.

147 A community of 120 persons has shrunk to less than 20 in only twenty years as the younger
[163] people have left to find employment in Stornoway and on the mainland. The present population structure seems to indicate a continuation of the downward trend.

GRAVIR AND GLENGRAVIR

151 Gravir, the largest Park township numerically in population and crofts, lies astride the major
154 east-west inlet of Loch Ouirn, a glacially modified line of structural weakness. The site of the township is perhaps the most picturesque in all Park, but the steep slopes, lack of cover, the small area of good arable land, and the considerable population existing on slim resources, problems common to Park as a whole, are all epitomised in Gravir.

361 On the south-facing-slope above the loch and the continuation of the trough in the valley to the
241 west, the majority of the crofts have been carved from moor to sea, some before 1800, and some
175 in the process of the abolition of run-rig which was accomplished in the years 1850 to 1852.
178 Originally, there appears to have been thirty crofts, but four were added during the nineteenth century, two at each end of the line, and in 1934 a further fifteen were cut out of the common grazing, a mile to the west of Gravir. On the south side of the loch, the 'clachan' of Tom an Fhuadain, established about 1800, has since developed into a further nine crofts. Thus there are forty-three legal crofts in Gravir and a further fifteen in Glengravir making fifty-eight in all.

The layout of Glengravir, a line of crofts from 3.6 to five acres, typifies the small post-1918 Department of Agriculture holdings. The arrangement of the Gravir crofts is illustrated in Figure 4, and it will be seen that not all the crofts are consolidated. There are three areas of former arable commons which have been lotted in unfenced strips and they may well be reclamations which were necessary to supplement the food producing capacity of the holdings. The method of division and allocation speaks of a period when a subsistence economy under severe pressure from over-population,necessitated fair shares for all. The last of these commons was in cultivation until 1891. Although subsistence crofting has been obsolete since then, there is as yet no move towards a regularisation of the layout.

178 The congestion which necessitated the reclamation of the arable commons developed mainly
176 as a result of a successful fishing industry which prospered from 1860 to 1914 and at one time there
228 were two curing stations in Gravir. With relative prosperity from an ancillary industry, cottars
161 were tolerated and the population rose from 197 in 1830, to 368 in 1881 reaching a peak of 468
162 in 1911. The collapse of the industry after 1914 began the downward trend which has certainly not yet ceased. Gravir reverted from 1918 to a township of agriculturalists and a base for employment furth of Lewis, although there have been spasms of successful fishing activity since.

241 Stock raising is now the function of the township and the agricultural resources and conditions
[251] are hardly conducive to the development of economic holdings. The Gravir and Glengravir crofts vary between 3.5 and 26.5 acres in size: no croft has more than four acres of 'old arable'. In the days of subsistence agriculture, and indeed until the 1930's, cultivation, all in narrow lazy-beds, banked up with stones at the downward extremity on the steep slopes, was much more extensive.
326 All the cultivable land was at one time under crop, heavily manured with seaweed cut as far away as
[137] Cromore or the coast south of Kebock Head. About one-third of the maximum lazy-bed area is now cropped and the more inaccessible areas of the crofts have reverted to pasture; some of the lazy-

231 Recent trends also point to a decline in the numbers of sheep, although more are kept now than
[288] fifteen years ago. From 1942-51 the numbers were more than doubled (263-565). A great deal of this increase must have been a result of the ewe subsidy, but part at least may be connected with the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have since fallen steadily. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

221 All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of
233 the year these sheep are grazed on the common pasture on the moor or on the eighteen acre island in the bay. In August, however, the lambs are gathered in for weaning and dipping; in November the gates are opened and all the sheep allowed to graze on the cleaner pasture within the croft boundaries. If necessary they are given fodder, but from the beginning of January they are encouraged to return to the moor, although the gates are not 'officially' closed until May.

311 The total area of the common pasture exceeds 1500 acres, but most of this consists of hummocky,
253 waterlogged peat moorland supporting only poor quality coarse grasses and sedges. Over 700 sheep now graze this area and the apparently large common pasture is in reality drastically overstocked, a process which must inevitably harm the animals as well as the land.

231 No pigs or horses are to be found in the township and each crofter keeps very few hens, normally
235 just sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold
235 to the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far
[235] from profitable.

234 It can be appreciated that crofts of this size and quality can neither provide the crofter and his
family with sufficient income, nor fully occupy the available labour force. As a result, people
464 in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primarily
228 a fishing township". Today the herring fishing has disappeared entirely and only one crofter still does a little lobster fishing, sending his catch direct to Billingsgate.

161 There are now 45 people resident in Orinsay but an examination of their ages reveals that less
162 than half of them are between 15 and 64 years. Indeed there are only six resident males between these ages, and three of these spend at least part of their time working away from the township on the Eishken estate.

366 As there is neither a school, post office, shop nor garage in Orinsay, there is no available
368 occupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 44
166 are permanently away in the Merchant Navy, returning home only for holidays, while another third
167 are seasonally away with the whalers. Similarly almost half of the females of similar age work in
464 domestic service in Glasgow. It must be realised that most of these people working away assist
505 their families at home, and that a large part of the croft incomes are made up of money sent home,
228 together with pensions and other allowances. Emigration from Orinsay to other areas has continued
462 steadily, twenty people leaving the township since the war.
352
344

On the whole, housing conditions are good, due to relatively recent construction. There is
314 only one traditional black-house, and even this house has electricity: only one house is without it.
372 Water supply is not so certain as wells and springs are the only source. The township lacks a
206 telephone and a shop, but is served by travelling vans. A good road, constructed within the last
366 decade, connects Orinsay with Gravir; entering the township via the valley to the north-east, it
491 serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles
494 distant.

161 Like so many other crofting townships Orinsay, above all else, gives an impression of con-
162 gestion. The self-same hills that provide shelter also restrict cultivation. The crux of the situation is that land, extremely marginal in character, is being worked by too many tenants on holdings too small to be economic. With three residents to every two acres of cultivated land, Orinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in the 'twenties'.

/f. 35/

[Orinsay]

253 The future existence of the common pasture the grazing is being seriously endangered by
[316] overstocking. The scoming is not enforced in Orinsay and the actual sheep stock exceeds the by 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has even been some peat cutting on the better grazing on the island. The dangers of overstocking and of indiscriminate peat cutting cannot be overstressed.

311 No evidence was seen of attempts to improve the quality of the common pasture. The estab
242 ment of shelter belts would provide not only shelter but a means of stopping the peat from 'slun down slopes if they were carefully sited. Much of the common pasture could be improved by a drainage scheme and by re-seeding, after sanding and liming, a project well within the capacit the resident labour force.

249 Good crops on a few of the crofts suggest that the land is not inherently sterile, however, it would seem that if the holdings were reduced to a maximum of four, an economic existence m be feasible on these crofts. The stony nature of the soil limits the possibilities of tractor cult but with an improvement in drainage, one might be used in the two valleys.

464 It is not so easy to be optimistic about the employment of surplus population resulting from
[288] such an enlargement of holdings, although a revival in the fishing industry could absorb most of the n present there are no looms in Orinsay and providing the Harris tweed industry can hold its own
[324] are possibilities in weaving. Seaweed is in plentiful supply, indeed Lemreway people also obta supplies and should its quality prove adequate,the establishment of a processing plant would pr valuable employment.

000 Nevertheless it is becoming increasingly obvious that unless the holdings can be enlarged, officially or by sub-letting, and some further employment created, Orinsay is liable to stagnat depopulation to continue. The township which was developed to relieve congestion is now itself congested.

SUMMARY AND CONCLUSIONS

124 The aim of the Glasgow University Department of Geography Crofting Survey is to record a analyse material relevant to the crofting districts, and in so doing provide a clear and impartia statement of the present situation. In inviting us to undertake a survey of Park, the Pairc Ass tion hoped that a body of fact would be assembled and conclusions drawn which would assist the Association in their admirable aims of advancing the well-being of the area. Their two Progr Reports, of 1956 and 1957, indicate that they have already investigated many of the possibilitie development. This summary refers to Park alone; it must be emphasised that until the su of crofting is completed, no final assessment of the Crofting Area as a whole can be made.

182 The district of Park is one of the more isolated and difficult crofting environments. The ru
of the terrain, the high proportion of land of very low agricultural value and sheer isolation ma
195 existence of human communities precarious. In addition, many of the Park communities were
511 established as a result of population pressure in more favourable areas of Lewis, and the origi economic and social values, and depopulation has resulted: the 1951 population was 60 per cent the 1911 total.

1. The Commissioners proposed that only holdings rented at £6 and over should have security tenure, with a view to discouraging the perpetuation of grossly uneconomic holdings; in the all holdings were given security of tenure.

However, not all such employment is available in Park: 47 percent of the insurable male population leave the Hebrides to find employment; one third take seasonal employment, and two-thirds permanent employment furth of Park (See Table VIII).

Employment within Park

Table IX shows that opportunities for local employment are strictly limited. Weaving of Harris tweed is the most important single source of employment. It is significant that those engaging in it are almost all crofters working in their abundant spare time. Weaving is an idea adjunct to croft work as it is unaffected by weather or hours of daylight and thus can be performed during periods of agricultural inactivity. The vagaries of the Harris tweed market make the occupation precarious; Park is one of the more inaccessible areas of Lewis and the mills are apt to give their commissions to the weavers nearer at hand around Stornoway when work is scarce. Since 1952, the number of weavers in the fishing townships of Cromore, Marivig, Calbost and Gravir has grown from 11 to 22 and much of the credit for this is due to the activities of the Pairc Association. Fishing, on the other hand, has lost ground in the same period: the number of fishermen has declined in these townships from 20 to 14[1]. Apart from weaving, service occupations form the only other employment available, shop-keeping, driving, and road maintenance being the chief occupations in the service group. There are very few craftsmen: with such a small population, and the long established tradition that the crofter builds his house and is his own tradesman, there is little opportunity for a trained builder, joine or even shoemaker to make a livelihood. The professional class is small and entirely composed of the minister and missionaries, the doctor and several schoolmasters.

There is little opportunity for women to find employment in Park, apart from nursing, shop-keeping and school teaching, and a few domestic service posts (See Table IX).

Employment furth of Park

The persons in the 15-44 age group form the main body of those working away from home. The distinction made between 'seasonally away' and 'regularly away' is that the former group spend part of the year elsewhere, the men on whalers in South Georgia or with the Tay Salmon Fisheries at Perth, or labouring on the mainland. The women are in domestic service, mainly in hotels. A majority of the men in the latter category are in the Merchant Navy; in some cases these men take leave to coincide with the spring work and the harvest. The majority of the women are in domestic service (See Tables IX and XI).

An interesting comparison in the 'regularly away' group exists between men and women in the professional classes (Tables IX and XI). The sample is small, but it is clear that more women than men attain professional status. The number of domestic servants, nurses, and merchant seamen is a reminder that the crofting districts provide a pool of labour for certain vital occupations, some none too popular in Britain as a whole. In people alone, one can say that Park makes a distinct contribution to the fabric of the national economy and this contribution is much more apparent outside Park than within the district. At the same time a majority of those who are temporarily or permanently away eventually marry and settle outside the district and thus a most valuable section of the community is constantly moving southwards. Only 35 per cent of the men in the 15-44 age group are wholly resident in Park, and 46 per cent of the women in the same age group, a reflection of the poor prospects and utter inadequacy of resources on the most of the crofts.

1 The 1952 figures are abstracted from the Lewis Survey Report on part of South Lochs.

Types of ancillary employment

241 464 The question of the desirability of ancillary employment in a crofting district is often debated. On the one hand, engaging in such work means less time for croft work and makes wholehearted participation in the agricultural life of the township a virtual impossibility. On the other hand, crofters who take ancillary employment are better able to make capital investment in their croft. Table IV shows that in Park, croft efficiency, as expressed by the souming 000 to actual stock ratio, is not necessarily related to participation in ancillary employment. If the township is to be re-established as a working entity, a clearer dichotomy in the population seems desirable; those who wish to work the croft on a full-time basis might be given full use of the available land, and those who wish to earn their living in non-crofting employment could take out feu charters for their houses. It is clear that the agricultural resources of Park are insufficient to maintain the present number of crofts as viable economic units but the problem of finding industrial employment for any large non-crofting population is very great.

184 464 The Park Association, in their keen search to attract industry, met with little response for high freight rates and distance from markets made economic industrial costing well-nigh impossible. The Chairman of the Crofters' Commission has recently suggested that some of the Glasgow Overspill of "tradesmen and small businesses" might find "an opportunity to prosper in the West Highlands and Islands"[1] but even with Government grants for the establishment of small factories, it is clear that present freight charges would be a severe deterrent.

178 228 One possibility is that the fishing industry might be revived. In 1945, 16 large motor vessels were fishing from the townships between Cromore and Gravir; by 1952, three boats remained;[2] only one boat was still fishing in 1958. The recent Fishing Board Scheme guarantee, which provides a flat weekly rate for every boat turning out, brings hope as this [435] guarantees a minimum livelihood. The major problem is the finding of the initial capital [452] required to buy and fit out a modern boat, at present about £20,000. Eighty-five per cent of this sum can already be found in the form of grants and loans from the Herring Industry Board but the remaining fifteen per cent or £3,000 is often the more difficult sum to raise. The Murdo Macaulay (Rhodesia) Trust has offered assistance to a limited number of fishermen towards the raising of the £3,000[3], and this offer is a real opportunity. If fishing is not re-started soon in Park, few of the original fishermen will remain to instruct the new generation.

484 [312] Tourism is an industry hardly developed at all in Park. Lack of running water has made the householders shy to offer accommodation, but it should be remembered that there are city dwellers who are delighted to accept inexpensive accommodation away from the crowded resorts. Dr. Stig Jaatinen, in his "Human Geography of the Outer Hebrides"[4], states that this fact has made the Aaland Islands prosperous, and believes that tourism on simple lines could be successfully developed in the Outer Hebrides. Tourism need not bring in its train the desecration of the Sabbath for people who are willing to journey far in search of a quiet holiday usually conform to local observances.

464 Unless new sources of employment are brought to Park, it is clear that ancillary employment must continue to be sought elsewhere. The higher 'spending standard' in industrial employment, and the opportunities to find entertainment in urban areas (tastes often resulting from experience during school days in Stornoway or National Service), militate against a large population of young people, but basically lack of employment and the uneconomic nature of the crofts are the real reasons for the high degree of temporary and permanent employment away from Park.

464 Of the 53 residents, 19 are over 65 and only 5 under 15 years, leaving a working populatio
161 of 29: seven are in permanent employment elsewhere. The population has been steadily
162 declining since its peak of 121 in 1901.
166
167

Since 1946, the township has changed considerably. It has been completely fenced and the
178 method of cultivation has changed from spade and horse-plough to tractor and cultivators. A
241 further fence has been erected for a lamb park and much land has been re-seeded; an increa
251 area has been put down to hay. It would seem that fattening of stock for market is intended,
4077 better attention is being paid to stock. Yet the population is ageing and there are few young men
162 to take the place of the older crofters; when working units become larger and stock decrease
a figure nearer the real carrying capacity of the grazing, the croft could become a profitable
concern: at the moment, the croft is only maintained through grants and ancillary earnings.
Should that happen, however, there must be more re-seeding and an increase of cultivation t
vide winter fodder.

KERSHADER

Philip W. Wheeler, M.A.

181 Kershader is a township of forty-three permanent residents on thirteen crofts, which str
161 for a mile along the southern shore of Loch Erisort. The crofts extend up to one-third of a
162 mile from the coast with a two-and-a-half mile deep hinterland of common grazing. The ext
133 elevation is 270 feet and the average from 125 feet to 175 feet, but the crofts, mostly arrang
361 in rectangular strips at right angles to the coast, are lower (maximum 125 feet) and include
three main zones (Fig. 8):

241 (a) From the low cliffs of the shore to the road, approximately, a zone mainly below 5
134 dissected by four rejuvenated valleys. The soils of the greater part of this zone ha
361 distinctive profile and tend to be moderately heavy, wet, and unsuited to fertilizati
seaware. The smaller hillocks in this zone have thinner soils of the same sort, bu
main hill (crofts 10/11) is an extension of zone (c).

(b) A zone between 50 feet and 75 feet with hills rising to over 100 feet. The lower ar
have varied soils, easily fertilised, and intermediate in type between those of (a) a
(b), with peaty-loam characteristics, overlying aquiferous gravels. The higher ar
have thinner soils of the same kind with poor grassy pasture; in places there are
of former skinning.

(c) A zone of hollows with deep moss soils requiring intensive drainage and reacting
to heavy fertilization with seaware and intervening heights covered with blanket bo
partly skinned, heather and grass. This zone passes into the common grazing.

Crofts 10, 11 and 12, irregular in disposition, have a steep coast line with gentler slopes
50 feet; crofts 2 to 8, steep slopes in parts of zone (b), and crofts 1 and 9, again of irregu
shape, are intermediate (Fig. 5).

241 In Kershader, there are thirteen legal crofts and twelve operative units. The crofts va
311 ween 4.4 and 18 acres, with a maximum of 3 acres reputed arable. In all, there are 23.4
reputed arable and 110.35 acres outrun. 24.5 acres are in fact under crop (oats 18.5, pot
6.0), and 9.5 acres under sown grass; and of the remaining 99.8 acres, mainly natural gr

CHAPTER FOURTEEN

CONCLUSIONS

H. A. Moisley

The relationships between Place, Folk and Work are seldom simple; in a crofting community such as Uig they are particularly complex. The object of our survey was to make an impartial, factual record of the physical and human resources and their utilisation, as described in the Preface (Part 1, page i). The primary purpose of this report is to make our observations available to others and to this end we have included a great deal of fact leavened, we hope, by a modicum of personal impression. In conclusion, however, it seems appropriate to add certain personal conclusions based on the detailed observations and data relating to the crofts and townships visited.

The outstanding fact is that, over the whole parish more than a quarter of the population between the ages of 15 and 64 has to leave home in order to make a living. Of those who remain at home, 80% of the men are more or less engaged in agriculture; almost all of these have some other source of income, usually weaving, and in most cases the cash income from agriculture must be less than £100. Although we classified some 60% of resident males as 'crofters with regular employment' this must not be taken to be necessarily the same as having a full-time job. The average income of a weaver in South Uig, for example, is only of the order of £250 per annum. Thus crofting with ancillary employment, or employment with ancillary crofting as is more often the case, conceals a good deal of under-employment. Such low incomes and hidden unemployment are characteristic of West European under-developed regions.

The crofting system can never provide an ideal structural system for agriculture, but that is not its real purpose. It is a social system and, whether it is economically efficient or not, it exists. It should not be allowed to decay for that would not only cause hardship to the crofting communities but would also, in the case of islands and other remote districts, lead to the abandonment of potentially productive resources of land and people. Nor should it be preserved unchanged; preservation would mean fossilisation and fossils are dead. The present crofting system was cast in a legislative mould in the late nineteenth century when population pressed heavily on the resources of the islands. Circumstances have now changed and the mould must be altered or the communities will slowly die.

This is not to say that wholesale reorganisation is required, at least not in Lewis. But the authorities charged with the welfare of the crofting townships, and of the island as a whole, have a duty to see that crofting evolves towards something more, and not less, productive. Subsidies alone are a confession of defeat. It is not good enough merely to spend money to alleviate the symptoms of a disease which it is now fashionable to call 'under-development'. Realistic planning is required so that the special public expenditure incurred in such regions becomes a productive investment and not merely a disguised form of charity.

It is encouraging to note that such economic and technical developments as have taken place (particularly the development of weaving and the improvement of common pastures) owe a good deal to local initiative and local investment. This suggests that, given suitable guidance and encouragement, the crofting townships can do much to help themselves. It would be an excellent thing if, in each district, informal and quite unofficial discussion groups could be started to think about the future of their particular townships in terms of development and not decay.

Realistic discussion of development must face certain facts even though in some cases they may be unpalatable or politically unpopular. Amongst the most important are these:

288 Highland Home Industries is the result of a union in 1914 of two similar movements begun fifty or sixty years ago by several beneficent women to help the crofters find a market for saleable manufactures and reduce their need for dependence on the often [464] exploitive barter system.[31] The Skye workshop has employed eight to ten men and women over the years, plus some who worked at home, but it has never been economic. In 1954 the director, a woman from Edinburgh, was unable to buy material and pay the wages of the four remaining weavers. The old market has disappeared. The shop was unsuccessfully offered for sale in February. Fortunately, a gift from an undisclosed source averted the necessity of closing down.

Only the very old people in Skye can remember when weaving was a household industry. Until the Harris people were settled on Skye at Portnanlong, it must have been a lost art. Today even the Harris folk have given up weaving. They say the purchase tax on luxury, hand woven woolens has destroyed their market. The hand shuttles on one or two looms which are used only move for special orders. The Portree woolen mill, originally established by the Highland Destitution Fund in 1851 and now owned by an east coast corporation, still operates on a limited production schedule. About a dozen village residents are employed regularly, and a few "tinker" girls, daughters of the wandering Highland tinsmiths, find work at the looms.

form of employment. Occasionally,
actors are employed for alterations.

As far as the crofting population is concerned, the benefits 274
are rather negligible. In fact some of the crofters of Carbost
township find the presence of the distillery to be a distinct
disadvantage because they must keep their "fank" in an inaccessible
location well off the drainage slopes which serve the plant.
I should add one additional fact. Like all the major commercial [47
ventures on the Island, the distillery is owned by a corporation
with offices in Edinburgh

Forestry. In recent years forestry has come to enjoy wide- 313
spread popularity among critics of the "Highland Problem" as
a remedy for the distress, lack of gainful employment, and
depopulation of the area. Within the last decade or so [464]
forestry has become a source of employment for a small number
of men on Skye. The Forestry Commission acquired 9000 acres
of land between Glen Brittle and Loch Eynort. Houses were
built for employees and nine new families were brought in.
Planting has been carried on at a rate which gives regular [464]
employment to 12 men, one man to each 120 plantable acres.
As the labor required for planting decreases, the men are
being shifted to thinning operations. Ultimately, they will
begin lumbering. It is anticipated that in time there will [464]
be jobs for sixty or more. For every 100 acres there will
be one man engaged in planting, thinning, or lumbering and
five men or women working in auxiliary employment, such as
transportation, mill operations, and services to the anticipated
village. The government has been impressed by the success
of its experiment. Another large tract, a former sheep farm,

An examination of the agricultural situation reveals that there are insufficient resources to ake the present number of crofts viable. Overstocking in sheep, an attempt to increase cash come, has resulted in a high mortality rate, and consequent losses. The tenant of a small croft faced with a classic dilemma. If he puts all his efforts into the working of the croft, the area potential arable land is insufficient to maintain a large stock and even if the best rules of sbandry were operated, croft income alone would be insufficient to provide a reasonable living. e fishing industry, formerly the chief means of a livelihood rather than the croft itself, has rtually disappeared, and he is forced to find ancillary employment in an area where little exists d thus migration in search of employment is the only solution. The croft becomes a base for n-agricultural activity and a means of providing produce for home consumption rather than an fective agricultural unit. On the larger crofts, it is clearly possible to make a living if sufficient ditional grazing in the non-crofting area is available - the agricultural townships, especially aforthhead, Shieldernish, Habost and Kershader, which comprise units sufficiently large and rtile, bear out this contention. Yet better husbandry is possible, and reclamation of the common azings for improved stock rearing has started. The agricultural townships as a whole are better voured by situation, soils and communications, and appear to possess a much greater degree of ability.

Since the decline of the fishing industry, the fishing townships have progressively declined. come from weaving has replaced earnings from fishing as a means of combining croft work and cillary employment to provide a living, but, as has been pointed out, the supply of weaving ntracts is not regular and greatly depends on the state of the world market. The present cen- alisation of the Harris Tweed Industry in Stornoway is not favourable to the Park weavers: the ggestion by the Park Association that a spinning mill be set up in Park would certainly help the cal weavers.

If the present number of agricultural units and level of husbandry on them is to be maintained, cillary employment on a large scale will continue to be necessary, and, as weaving and the rvice occupations alone certainly cannot provide it in sufficient quantity, temporary and regular nployment furth of Park is bound to continue, and as this grades into permanent migration, the pulation must continue to decline and age. The capacity of the area for tourism is also limited. th the overheads which branches of parent lowland factories would have to face, the establishment manufacturing or assembling employment is also unlikely.

A revival of the fishing industry holds out most hope but must take place before all the accrued ill has disappeared with the older generation of fishermen. The fishing grounds are within reach the modern £20,000 boat: by co-operation between crews, fish could be taken to mainland markets ch as Ullapool as indeed happens at present. Lobster fishing could be integrated with herring and nite fishing. Such a combination of several types of fishing would ensure a more balanced economy d the Herring Subsidy would be a guaranteed element of income. It must be agreed that if main- nd boats do come to the coast and sea lochs of Park, there seems little reason why local boats uld not also be successful.

As far as the land is concerned, the survey leaves no doubt that improvements in husbandry and stures are definitely possible. Yet, until viable agricultural units have been created, there is tle incentive for large scale improvement in either sphere. It is an expert's opinion that no crofter rking on a croft in Park which would bring in £300 a year would have time to engage in ancillary rk and at the same time fully work his holding in accordance with the rules of good husbandry. If s opinion is accepted, and if it is also accepted that such crofts are desirable and the present ccessful crofts in the agricultural townships where there is a higher proportion of full-time ofters than elsewhere would bear this out, it follows that ancillary employment on such units would ve to be ruled out.

Park Association Annual Report, 1956.

The reduction of the present number of agricultural units then becomes desirable. There are o ways in which this could come about; firstly by continued depopulation, but amalgamations con- quent on such an uncontrolled run-down of the community would lead to scattered holdings; such the experience of other depopulated crofting districts. The second point to be made is that if erall planning were possible, it would be desirable for holdings to be amalgamated as they become cant as a satisfactory rearrangement of the townships would then follow.

Concurrent with such a policy would be the aim to create distinct crofting and non-crofting oups. Employment for the non-crofting section of the community, be it fishing or weaving, would rst have to be assured. As has already been stated, fishing would appear to offer the best prospects, hile tourism could play a minor role in providing an opportunity for the enterprising crofters' fe or non-crofting household. One problem above all remains, the maintenance of an overall able population. A certain minimum level of population is essential to maintain the operation of cal transport, post office, educational and medical services. Such considerations suggest that rther research is necessary to assess the optimum number and structure of population which a strict such as Park could reasonably support. In the same way, a detailed examination by an gricultural expert is desirable, in order to assess the number of economic holdings which could supported on the land of each township.

In conclusion, it is clear that, short of unexpected industrial employment becoming available in ark and unless major reorganisation of the present agricultural units and communities is carried t, the present population trends must continue. However, if such radical changes cannot be ntemplated, then considerable improvements in the standard of husbandry, the re-seeding of oft out-runs and common pastures, and the fencing and general improvements of the crofts are ssible and will increase agricultural productivity. Until there are some radical changes, the resent pattern of the most enterprising members of the community engaging in ancillary employment hich takes them furth of the district, and the serious degree of permanent migration to Stornoway d the Scottish Lowlands, will be maintained and increased.

APPENDIX A

PARK IN COMPARISON WITH OTHER CROFTING DISTRICTS.

Table XVIII gives an analysis of the occupational structure of the male population of insurable e in four crofting districts studied by the Crofting Survey. In all four areas, a considerable oportion of the insurable population is not resident in the crofting area for more than an annual liday period. This proportion varies in relation to two main factors - the viability of the crofts d the availability of ancillary employment within the district. South Uist and Benbecula stand t as the districts where such permanent absences are least marked: the crofts in these islands are rger and more employment is available. In Barra, there are few large agricultural units and, as Park, the decline of the fishing industry has led to economic disaster in many townships. Fewer an half of the men in this age group are fully resident in Barra. Park is in many respects com- rable to Waternish (Skye) for both districts are isolated and have experienced serious depopula- on. (see Table XIX).

It is a significant fact that in none of these districts are more than 20 per cent of the male pulation solely engaged in full-time croft work, and this is a measure of the inability of the crofts support a family without ancillary earnings. The amount of permanent employment available ries from district to district. In South Uist and Barra there are minor service centres which are ban in character and 23.2 per cent and 13.6 per cent of the respective insurable males are gaged in non-crofting employment on these islands.

It is clear that the occupational structure of these four crofting areas is far from stable for over e-third of the potential labour force is away for all or part of the year. It is also clear that sically the absence of sufficient natural resources, coupled with the varying degrees of isolation om the industrial centres of Scotland, are the root causes of the present position.

Table XIX summarises the population structure and trends for the four districts. It is significant at the two districts without service centres, which provide a range of ancillary employment, have xperienced more severe depopulation since 1939. This table also underlines the fact that earnings om seasonal employment are insufficient: the incidence of permanent employment furth of the stricts is three times as great as the incidence of seasonal employment.

APPENDIX B

SHIELINGS - A NOTE

John E. Wearmouth with illustrations by Beth Blowers

From Figure 1, compiled from the First Edition six-inch map of the Ordnance Survey (1850 1852) and from personal observations, it is clear that the shieling system was at one time overall feature of Park for the whole peninsula has traces of this transhumant economy.

The rudimentary structures, some of turf, others of stones and roofed with bracken or ather thatch, are all sited on well drained sites, the majority on mounds. Almost all the es are close to lochs or streams. The majority are in loose groups of from two to nine ildings, although there are some in isolation; no site has as many as twenty-six buildings found at Airidh na Gaoithe in North Uist.

There appears to be two distinctive shapes of building - oval and rectangular (Fig.10). shielings measured exhibited a remarkable similarity in dimensions, from 17½ by 9 feet 13 by 12 feet. The oval structures are generally larger than the rectangular ones. Most the shielings had two entrances, often, but not always, opposite each other.

The shieling system died out in Park about 1880 but the cattle continued to graze around the elings on the better grass, and the crofters had still to go out to milk the cattle at the shieling, hough they no longer lived there. The sheep still use the mounds for shelter and grazing. ese features of an obsolete economy are still easily recognisable from the luxuriant grass ver in a wilderness of peat bog and bare rock.

APPENDIX C

NORSE SETTLEMENTS NAMES IN NORTHERN PARK, LEWIS

Bridget M. Gordon, B.A., B. Litt.

: Magne Oftedal, The Village Names of Lewis in the Outer Hebrides; in Norsk Tidskrift for ogvidenskap, vol. XVII, 1954, (Oslo), pp. 363 ff.

Professor Oftedal points out the difficulties of these Norse-Gaelic settlement names: inurate spellings even in modern times, and lack of any useful evidence from older sources, ke almost all the derivations a matter of conjecture. Sometimes two or more ON equivalents possible (e.g. for Calbost), sometimes no satisfactory solution can be found (e.g. for nreway). Since Professor Oftedal frequently bases his explanation on pronunciations not orded in written forms, his evidence is largely followed here.

ELDERNISH: the second element is N nes, 'headland'. Oftedal's explanation of the first ilda, genitive plural of N sild, 'herring', is satisfactory linguistically, but seems unlikely eaning.

/facing p. 40/

culture which can hardly be distinguished from that of the Lowland rural areas, but it has by no means disappeared.

Socially, these changes, particularly the introduction of national laws of land tenure, involved a leveling of the social hierarchy. The old polarity of the land lord and tenant, with an intermediate group of doctors, ministers, and tradesmen, was restored. The place of the tacksman, of course, has been filled by the government. The bulk of the population was once again undifferentiated socially or economically. Land lost much of its commercial value for the proprietors. It once again had more of an intrinsic value, almost as in the days of the clan. The status of the proprietors, locally and as a horizontal segment of the total British population, depended on land ownership. The graziers and the proprietors who had appeared during the "Clearances" withdrew, selling out to the national government.

These changes did not work to halt the continuous outward flow of the Sgiathanach. To the contrary, increasing integration with the national culture created new needs, such as a demand for a higher standard of living and an opportunity to achieve status, and provided the training necessary for the youth to find roles more suitable to their talents elsewhere in the world. The young men and women of Skye journeyed to the Lowlands to join the national labor force, to enter the professions, or to seek other permanent employment. Thus, emigration changed from a movement by families to a movement by individuals. At the same time, the benefits of the crofters' legislation and the program of government assistance made it possible for the

crofting system. Both the communal nature of the system and the smallness of the crofts deter improvement. Although the government reversed the trend toward making the land an important source of wealth and individualization of the land, by replacing customary forms of tenure with national laws of tenure, and has tried to correct the disadvantages under which the crofter labors, if not always successfully, the Skye crofter has made only a partial adjustment to the larger, specialized national culture. In fact, the land is used less systematically than it was in the past, in the times of the shielings. The crofters have not only ceased trying to reclaim arable but also have allowed much of the arable to go back to grass.

Ever since the closing years of the first period of the modern era, Skyemen have sought employment as a part of the national labor force. During the third and fourth periods, they joined the landless labor force in the Lowlands. There is practically no local opportunity for a landless man to support a family. The majority must remain pastoral agriculturalists who depend on seasonal employment, or some other form of financial assistance, to augment their income.

Improved communications and the ensuing development of commerce has brought a village to the island. It functions as a market center and as the administrative center for the island. It has not served to bring the island together; it is still something alien to their heritage. Accompanying the growth of the village, there was local development in the

than the bare essentials, these people just get along. Even so, they would be unable to get by were it not for some form of supplementary income. This essential prerequisite for the individual or family who upholds the crofting tradition may take the form of seasonal employment on the island or away from home; contributions from a child or, less frequently, a brother or sister; or payments from the government in the form of unemployment compensation, relief, or a pension.

Many a Sgiathanach thinks of his croft as a home more than anything else. There are men who have found full time employment. Some in this catagory work the croft in the evening. Others expect their wives to care for the crops and stock, or they leave the land untouched. Then, there are the old men and women who have returned to their ancestral homes to spend the twilight of their lives. These exiles come back from cities as near as Inverness and from places as far away as the sheep ranches of Montana or the cities of Australia. Perhaps, the most significant point is that for all Skyemen the croft cannot be evaluated merely in terms of acreage and income. As we shall see, it is a way of life in which an attachment to the land, as an embodiment of kinship, plays a very important part.

The incomes of three representative crofts clearly reveal the financial difficulties under which the crofting family labors. Although I have somewhat arbitrarily divided the holdings into small, medium and large on the basis of acres of arable land, it should be remembered that this

The Part-time Crofter. The part-time crofter follows much the same schedule and shares the same succession and variety of chores. Indeed, some are not so much part-time crofters as they are part-time employees. As such, they are successfully preserving a traditional economy no longer en rapport with the surrounding twentieth century commercial world by depending upon economic benefits of contractual relationships to the smallest possible degree. One fellow saw the situation this way: "We don't need factories and the like; what we need is something that will give us time to attend to our crofts." Others feel that if they have to abandon the traditional way of life, they might just as well leave the island for places where greater opportunities for social activity are joined with relative economic prosperity.

The part-time crofter has less land than the full-time crofter and less need for cultivating all of it because he has fewer cattle to feed during the winter. He, therefore, devotes less time to tilling his soil. On the other hand, although he has fewer sheep, the collective flock of his township is almost always larger than the stock of a large croft. Consequently, he spends more time dipping, marking, and shearing sheep in cooperation with his neighbors. Hired labor plays a minor role in the townships. Often the only hired hand is one of their number who assumes the responsibility of shepherding the flock. Some of the townships with club stocks, however, have adopted the practice of paying each shareholder for his labor out of the profits to encourage cooperation or to penalize those who do not do their full share.

lambing season, the crofter and his family go out on the moor to cut their peat for the following winter. The man uses a "tusker," a two-bladed spade, to cut the peat. His wife or his children follow behind, tossing the peats out of the ditch and building small, loose stacks for drying. After the lambs have been marked and the sheep dipped in June and the shearing finished in July, the family returns to the banks to carry the peats to the nearest road, actually a beaten cart path, in creels. They are then carted home and stacked near the door. There is a growing tendency for both the part-time and spare-time crofter to give up cutting peat. It is not because coal is cheaper or he needs time for other pressing chores. His auxiliary occupation will not permit his devoting the necessary time to this long and arduous task. He is caught between the traditional economic patterns and the money economy of which he has become a part.

The year for our part-time crofter, as for all active crofters ends in November. By then the oat and hay harvest has been stacked by the house and the potatoes and turnips stored in the ground, the wool shipped off to market, the surplus sheep and cattle have gone to market, and the rams are on the hill. Now follows a period of enforced idleness, broken by feeding the cattle. As we have seen many go away to find employment, leaving the care of the croft to their wives who have shared the work of crofting in addition to their own womanly responsibilities. We must turn to the spare-time crofter to discover just how heavy the burden of labor may depend upon the women of Skye.

finally scrapped for ammunition. Drying sheds have been erected at Staffin. Power machinery for extraction has been brought in; a processing plant has been built at Uig with German equipment; and experienced men have been employed.

The industry is admirably suited to the island. The great weight-losing properties of the raw material, the scarcity value of good deposits, and the large commercial demand combine to offset the high cost of transportation from which most export items suffer. It is estimated by the directors of the company, an English concern, at least that fifty men will eventually be employed in the pit and at the plant. They will be given regular employment, five days a week in three shifts. In addition to building the access road the government, through the Department of Agriculture, has leased the site, and the Inverness County Council has erected subsidized housing at Uig to encourage the venture. When the Secretary of State presided at the opening of the plant in May, 1954, he spoke of the promise the industry held for the Island's future, especially the prospect of regular employment. Up to June, 1954, however, the employment was irregular and limited to sixteen men.

The Skye Tweed Industry. About twenty-five years ago a small weaving and basketry shop was established at Duntulm in Kilmuir. The factor for the Department of Agriculture acted as manager, and the local Church of Scotland minister was the foreman. Later it was taken over by the Highland Home Industries, a cooperative, non-profit corporation.

hinterland with the outside world, Portree is a center for tourists during the summer. Due to the people's dependence on tourism and also the presence of newcomers, the villagers participate in a number of social activities which are not tolerated elsewhere on the island because of religious asceticism.

Glendale and Kilmuir are crofting communities, each with a population of about 300. All, except the ministers and school teachers, are dependent on the breeding of cattle and sheep and the growing of a limited amount of grain, potatoes and hay for all or a large part of their livelihood. All are bilingual, speaking Gaelic and English. Neither community has a village nucleus, but both have an economic focus. Glendale has a cooperative farm, and Kilmuir has a drained loch which has been divided among the small farmers. The significant differences between them are three. The Glendale people are land owners. In this respect they are rather unique in the Highlands. The Kilmuir residents, like most Highlanders, rent their crofts. The second difference is religious. Glendale is religiously homogeneous while Kilmuir includes church-goers of three Presbyterian sects. Finally, no formal social activities other than an annual meeting of the share-holders in the farm is allowed in Glendale, but Kilmuir has a club organization for the men who gather for lectures and discussions of economic problems.

Non-crofting Economic Activity

464 Employment opportunities on the island are limited. The only industries are a small malt distillery, which employs thirty men, a small wool textile mill where about 15 men and 15 women find work, and a few gravel and sand pits. There is a promise of greater employment opportunities in the extraction and processing of diatomite and in forestry. A few men are fishermen. The majority of men who work for a wage are seasonally employed in service operations, especially county road workers, bus and truck drivers, and general laborers. A number seasonally migrate to the mainland during the winter or go to sea. Women find employment in hotels during the summer or local shops. There are no active household industries. Many young women spend the summer on the mainland in domestic service. In several areas the crofters are dependent on the tourist trade for almost all of their income. The summer tourist trade is one of the most important sources of revenue for the island.

The Settlement Pattern

361 The settlement pattern on Skye, like the system of land use, is an ecological adaptation of the culture to the environment which has been stabilized in its essential details since the Neolithic. The areas of permanent settlement have always been limited to the coastal fringe and a few internal glens, regions with the best agricultural conditions, and to elevations under 400 feet. Further, man has tended to concentrate on the

compared with 34.9 for Scotland. The death rate among Skyemen, however, was 17.4 compared with 22.0 for Scots in general. But Scotland had a net emigration rate of only 3.6 while the Skyemen were leaving at a rate of 16.5. In this decade no fewer than 3,115 left Skye.

By the end of the third period an additional influence of the process of commercialization had become apparent. The social hierarchy was modified in the direction of greater socio-economic differentiation.[68] At the time of the "Forty-five" Skye was inhabited by the families of three clan chiefs, 139 tacksmen, 517 joint-tenants, 1031 subtenants, and 444 servants. There were now 10 landlords. The tacksmen had been replaced by 29 graziers and 12 small farmers. The joint-tenants, subtenants, and servants had become 2043 crofters and 1227 cottars. In the past there may have been one innkeeper, at Portree, and a few millers; now there were 32 innkeepers, millers, and merchants.

The changes which we have been considering could not have left the patterns of interaction undisturbed. Cooperation among the members of the township would have been unnecessary. Since all were affected by prolonged destitution, mutual aid must have been severely curtailed. The extended family was broken by emigration. The nuclear family was seldom intact for more than part of the year. It seems the majority of the able-bodied men were travelling to the east coast each spring to find

136.

*175 wealth, rose above the indigent crofters and cottars.
*178
427 These changes had a pronounced effect on the culture and
123 the population. Economic hardship and evictions prompted
354 emigration, forced many men and women to seek seasonal work
167 away from home, and led to a reduction in the marriage rate.
469 Crofting which had already become part-time agriculture now
585 was a spare-time pursuit. The Sgiathanach was dependent on
241 money, on the wider economy, for the satisfaction of most
511 of his needs. The croft was providing no more than a few
241 potatoes for the table and some oats for the cattle, the
262 crofter's only export. Still, no landless working force
231 appeared. Portree had grown and there was a woolen mill,
464 but there does not seem to have been any marked movement into
146 the village by the crofters.

While much of what was meaningful to the people was being
*175 lost, the religious Revival continued. The conservatism of the
*178 "Men" became an official policy of a new church. The emotional
182 approach of the ministers and the "Men," who were now elders
186 in the church, and the emotionalism of the large outdoor
795 meetings functioned to restore the social disequilibrium.
781 Although the extended family, township, and nuclear family
771 suffered from instability, the people found intelligible roles
793 within the religious sphere of activity. Their religion was reinforcing their way of life. The abhorrence of much of the old culture was accompanied by a strengthening of many traits which reaffirmed the desirable status values. The culture found a new focus in congregational religion and was able to maintain a continuity while the content changed.

ultural considerations enter. The land is often essential
continued existence of the farm or the crofting township.
t, for example, the land which the Forestry Commission
ted as commercially valuable is the lower, sheltered
s of several farms and crofting townships. Finally, there
people's dislike of trees. Many a Sgiathanach in Portree
ressed by the plans to cover Glen Sligihan with a forest.
are the attitude of a man from Soay, a small island a
istance off the west coast of Skye, near Glen Brittle,
being moved to the Isle of Mull by the Department of
ture when Soay was evacuated at the crofters' request.
ts all right down there, but you can't see the sky un-
u bend over like this," he said bending over double and
over his shoulder.

e have now accounted for, at the most, 120 men and 20
ho work for wages and 238 crofter-fishermen. Excluding
ter, there are over 1000 men and almost 500 women who
loyed locally at sometime during the year.[32] With only
emaining isolated industries, such as the small silica
arry at Ord in Sleat and the infrequently used limestone
ble deposits at Broadford in Strath, most of the opportunities
loyment have to be in services for women and laboring
.

et us consider the occupations of women. Over half are
d as resident domestic servants or as help in hotels and
ants. Ten percent find work in the local shops as clerks.

[32]Information extracted from the files of the Ministry of
n Scotland, Portree and Edinburgh.

An equal number, but mainly newcomers to Skye, are teachers 462
and nurses. The remainder are employees of the national and 464
county government, serving as postmistresses and clerks. In
addition, an indeterminate number of women, in Portree and in
the rural hinterland, but none in Kilmuir or Glendale, add
to their income by taking in summer visitors. This practice is
not strictly legal for the crofters, in as much as it casts
doubt on the agricultural valuation or devaluation, but the
county government has not attempted to discourage the practice.

Turning to the men of Skye, we find that the largest
employer is the county government, with well over 200 men on
the payroll as road workers and general laborers. The national
government, directly and indirectly, in recent years has employed
another 200 or more men through the Department of Agriculture,
as overseers, agricultural workers, and laborers; through the
North of Scotland Hydo-electric Board; and in the post offices.
If we add the number who work for the nationalized ferry service [657]
and the subsidized steamer service, we find that over half of
the wage earners on the island depend on the government for
their wages. The only other fields open to men are in agriculture,
as farm help or township shepherds; in transport, as bus and
truck drivers; and in hotels, as barmen, waiters, and porters.

These jobs are by no means permanent or regular. It is 464
not at all unusual to have 300 or 400 unemployed during the
winter when road work falls off and the tourist season is ended.
They will then draw compensation from the Ministry of Labor, [745]
as will the younger men and women who have been working on the

mainland for the summer. For many of these people, unemploy- 464
ment is a misnomer. It means they are receiving a weekly 745
allowance from the government while they wait for the next
seasonal opportunity to turn from crofting to wage labor. More-
over, providing work and paying unemployment compensation is
by no means all the government does for the Island's economy.
Through the National Assistance Program many more are aided
financially. In 1954, for example, there were no fewer than
726 individuals receiving some form of national assistance.[33]
Most of this number were recipients of a non-contributory old
age pension. The next largest category were young women
required at home to care for aged and infirm parents. Of the
total number, only thirty were Portree residents. Then, too, [65
there are the previously mentioned subsidies and grants for
agricultural improvement and fuller exploitation of the land.

We may conclude, then, that cultural continuity is an 182
expensive proposition with a double-edged penalty. On the 167
one hand, there is the sentimental distress which depopulation 657
involves. Both the man who leaves Skye and those he leaves
behind feel the loss of their loved ones. On the other hand,
there is the expense to the government, which must be staggering
and out of all proportion to the amount contributed by the
people in taxes. It is not that the islands receive any special
grants, but, as one newcomer said, "They just happen to qualify
for all the grants, doles, and subsidies there are." He, of
course, was exaggerating. As we shall see in the next chapter,

[33]Information extracted from the files of the National
Assistance Board in Scotland, Edinburgh.

I hardly need to add after our discussion of the islanders' economy that the chances of a young couple finding a vacant croft are slim. It may be of interest to indicate just how slim they really are. In 1953-54, in 82 townships, which I visited, there were only eight vacancies. Six of these were no larger than cottars' gardens. There were no vacant holdings in Kilmuir or Glendale. I am not talking about derelict crofts in the hands of absentees. Moreover, if the individual decides that working in Portree is better than leaving the island, his prospects are no better. The County Council had sixty-six units in a public housing scheme under construction, in 1953, in addition to fifty-six completed since the end of World War II. There were three applicants for each apartment. The county sanitary engineer, who was responsible for allocating the apartments, began to think half the population of Portree was dying, and the other half was dead. In order to get priority, the people were claiming disabilities, "some of them with names as long as your arm." Many of the people, especially young people, regard winning out in the competition as an indication of status. But we are getting away from the croft. We still have to consider how a person gets possession of the croft.

As we know, the crofter has the right to bequeath his croft to a member of his family; however, he seldom bothers to exercise his right. Here is another example of their incomplete adaptation to the higher socio-cultural level. The land and the house have very little monetary value. Usually, the man who leaves a will has been talked into it by an officer of the Department of Agriculture. He, then, assigns

Skye

We have already seen where some of the crofters sons and daughters have gone - all over the world. It may be of interest to indicate the fields which are attracting the present generation. In Scotland children graduate from school at fifteen or, if they have qualified for the university training course, at eighteen. Let us see what happens to those who leave school at fifteen. A reasonable number of the boys go back to the croft, but the school teachers usually try to guide the best students into other fields. Since there is a very limited choice of skilled or semi-skilled jobs on the island, this means they will go to a city in southern Scotland and find an apprenticeship, either on their own initiative or under the Ministry of Labor training program. The favorite trades are mechanics, electricians, and carpenters. A few go to sea, especially as stewards and wireless operators. Every now and then a boy will become a male nurse, a police cadet, or an office worker. Hotel service, laboring, and especially, truck driving, at home or away, attracts many. Girls leaving school at fifteen often go back to the croft for a year or two and then move away. The best girl students either go into office work or take advantage of the Ministry of Labor apprenticeship program, especially in dressmaking, hairdressing, and domestic science. Some go to pre-nursing schools. Others find employment in stores or hotels on Skye or in Lowland Scotland.

At eighteen it is very difficult to keep a boy at home. Those who have remained and have not taken a university course

will be called into National Service. It has become very hard to obtain a deferment. One reason is that the government believes too many have been dodging their obligation. There was a man, for example, who applied for a deferment for his son on the ground that he was needed on the croft. Ordinarily the boy might have been deferred, but not when the officer found his father was collecting unemployment compensation. The most popular field for girls at eighteen is nursing. One family has sent three girls through nursing school. Another popular profession, for both boys and girls, is teaching. The boys who go to university take their degrees in pure science, medicine, and agriculture.

3 There is an interesting contrast here between the Highlands and the rest of Great Britain, especially England. In England few working men consider sending their children on to college. On Skye, the majority of those who go to the university from the local schools are from poor homes. The landed gentry send their children to preparatory schools in England, and most of the doctors send their sons to private schools. Somehow the boys and girls from the crofts scrape through. An additional fact I might mention is that despite the government's interest in maintaining the Highland population because, among other reasons, it is a reservoir for the armed forces, very few boys and even fewer girls voluntarily select a military career. Indeed, few men have seen service with the Army or Navy. The previously mentioned sample of the marital status of males also revealed that only 57 of the 270 men have seen active service in units other than the Territorial Army or Home Guard. This

acceptance of the potato, a much more productive and dependable 161
subsistence item than grain on Skye, made it possible for more 175
people to live on less land. The introduction of a new industry 241
kelping, provided many with employment and freed them from com- 464
plete dependence on a subsistence economy. Vaccination reduced 757
the mortality rate, especially among infants whose chances of 166
reaching maturity and procreating were thus enhanced. Another 541
important factor was the Skyeman's share in the general pros-
perity of British agriculturalists during the early years of
the Industrial Revolution and during the Napoleonic Wars. An 423
especially important factor was the practice of subdividing 593
the land which made early marriage possible, in particular after
the installation of the crofting system. Finally, but by no 161
means least significant, there was the persistence of many 175
typical features of the culture in the days of the clan. The 178
sentimental ties of kinship and attachment to the soil had 182
remained.

The population decrease, partially a result of the Skyeman's 161
involvement in the process of commercialization, was primarily 175
a result of a failure to fully adjust to the higher, more 178
heterogeneous socio-economic level. By the end of the second 184
period of the modern epoch, 1845, the people had become hostile
to the potato and their own fertility. When the potato failed
them, they had nothing to fall back upon, except the generosity
of their landlords. The castle and kelp markets had collapsed
at the end of the Wars, and the subdivided land could not
produce sufficient grain. The belief of many that the population had over-run the limited local resources was confirmed.

The growth of the population ended with a prolonged famine. 161
The proprietors, finding that the people's only justification 731
for crowding the estates and looking to their landlords for 427
help were some nebulous customary usages, facilitated the
decline by disregarding custom and throwing as much land into
sheep farming as was possible. While evictions were not new, 427
only after the famine did they result in an absolute reduction
in numbers. The Gaidhanach, fettered by a lack of capital 182
and an inability to break with the past, could not make the
final adjustment required by the process of commercialization,
specialization. In addition to emigration, the Clearances 167
and general economic hardship forced a postponement of 582
marriage. There was neither land nor regular employment to 464
provide a livelihood.

Later in the nineteenth century new influences began 161
to play a role in the continuing decline of the population. 167
Following the passage of the Crofters' Act, the nature of 178
emigration changed. Seasonal migration became negligible. 427
The provisions of the Act, and ensuing legislation, made it 671
possible for a man to remain away during his active years and
return to the parental croft to spend his old age. The ex-
tention of education not only equipped the youth for life in
the larger society but also created demands for objectives
which could not be attained at home under the existing order.
Thus, as in the period of population growth, the persistence of 161
many features of the old traditional culture, and the renewed 167
importance of others, were fraught with no little consequence. 182

of tenure function to protect the individual from potential 178
abuses by a landlord where customary usages once fulfilled the 182
need. Moreover, even though the tenure of the cultivated soil 423
grants all the rights of a landholder, including the rights 427
to bequeath the house and land to a member of one's family, 657
for more than half the year it is used communally.

The Gaidhanach has never adjusted sufficiently to become 178
a specialist, not even a specialized grazier. For him the 423
land has always had a more fundamental value than merely being
a means of livelihood. It is the ancestral home. There is a
sentimental attachment to the land which is an expression of
the affectionate bonds of kinship. The people have never lost
the tribal tie of the land and the group. Although the former
patriarchs disclaimed any sympathy with this point of view,
the landlords on Skye today have kept what little land they
have only because of its sentimental value. Indeed the atti- 656
tude of the largest landholder, the government of Scotland,
is that the crofting tradition is worth while preserving, if
for no other reason, because in the predominantly urban and
industrial civilization it has a romantic value. There are
other reasons. The Islands have long been looked upon as a 702
human reservoir for the armed forces, and, more recently, for 464
Lowland industry.

As a result of their partial adjustment to the higher 178
socio-cultural level, there have been changes in crops and stock. 231
The British market has influenced the crofters' output, within 740
ecological limitations. The old subsistence crops of oats and 423

465

465 WAGES AND SALARIES--wage levels (e.g., real and money wages); range and variation by occupational categories; composition (e.g., proportion paid in money, in board and keep, in share of product); fees and percentages; determination of wages (e.g., by custom, negotiation, edict or legislation); payments (e.g., daily, weekly, monthly); regulation (e.g., minimum wage legislation); etc. See also:

Income and purchasing power . . . . . 436 Standard of living 811

175 Around this time, various factors had encouraged
161 an increase in population. After Scotland's union
with England in 1707, the prohibition on the import of
cattle into England was lifted, and trade in cattle
became economically more important (Day 1918: 26).
The numerous wars of this period caused the price of
cattle to double between 1736 and 1766 (Day 1918: 180).
Clan warfare diminished; the potato was introduced;
and vaccine for smallpox became available.

175 The increase in population led to an extreme
161 crowding of land in some areas, which made agricultural
reform difficult. Many landlords tried to encourage
166 tenants of their estates to emigrate. The appearance of
a market for kelp, which lasted from the middle of the
18th century to about 1815, discouraged landlords from
implementing policies of depopulation that would
175 diminish their labor force. An alkaline extract of
824 kelp was used in a variety of manufactured goods, such
323 as soap and glass. The seaweed was gathered by men,
368 women and children living along the coasts, and burned
in rough open kilns. Tenants who worked at this
465 occupation received 13-4, and the landlords 118-20,
per ton (Mackinlay 1878: vii); the landlord received
as high an income as 110,000 to 120,000 a year from the
burning of kelp (Gray 1957: 42).

175 out in Lewis, and the Harris Tweed Association was
178 ineffective in enforcing its standards. In 1934,
283 weavers were allowed to use yarn spun in island mills,
284 and production increased; but no weaving was allowed
441 to be done in the mills. All looms were removed from
those mills which had tried to centralize this stage
of production. The actual process of weaving remained,
by legal definition, decentralized, although the word
"crofter" was changed to "islander," thus widening the
category of persons who could weave "Harris Tweed," and
paving the way for centralization of weavers in the town
of Stornoway.

236 Any person can purchase his own yarn, weave his own
283 tweeds, and sell them to tailors or summer tourists;
467 but before a weaver can weave for the mills, he must be
registered with the Weavers Union. The Weavers Union is
a branch of the Transport and General Workers Union,
which includes mill employees, hospital workers, lorry
297 drivers, and others. It is an anomaly of the Harris
467 Tweed industry that workers classed as self-employed
should join a union of employees and is another indication
of the centralization of control and power in the mills,
with whom the weavers, along with the mill workers, bargai
283 for higher wages. Weavers receive a basic sum of over
452 £10 for each length of tweed, which is usually 38 weaver's
467
804

465
185 yards (a weaver's yard is equal to 8 feet, a measure
185 which derives from the size of the frame once used
(804) to wind hanks of yarn). Payment varies according to
the number of colors used in the pattern. A weaver
288 may average 2½ tweeds per week when the work is available,
465 thus earning more than mill workers. A female mill
[562] worker earns about £11 or £12, and her male counterpart
about £3 more.

288 Because weavers are classed as self-employed, they
745 do not qualify for unemployment benefits. They may apply
659 for social security, but must submit to a "means" test,
and the possession of bank savings or other assets
disqualifies them from receiving such aid. All British
workers must pay a weekly sum for "insurance stamps," a
certain number of which makes the workers eligible for
small payments from the government during periods of
illness. Self-employed persons must pay for their own
insurance stamps, whereas employers pay for the stamps
of their workers. A weaver who does not keep up with his
payments of over one pound a week for insurance stamps
must pay the accumulated debt at a later time.

491 Weavers face other costs. They buy looms and bobbin-
288 winding machines, and pay for lighting, heating, and the
288 maintenance of all equipment. The preservation of this
463 anomalous status of "self-employed" is related to the
438

195 to join the Free Church (Donaldson 1960: 100). The Free
795 Presbyterians left the Free Church in 1893 because they
found it too "liberal." Several dissenting groups,
including most of the members of the Free Church, formed
[659] a United Free Church at the turn of the century. After
a long court case, the church property was left with the
Free Church, which continues to support itself without aid
195 from the state. Collections and funds solicited by
194 villagers who visit the households periodically are sent
• 465 to a central office in Edinburgh, which pays all ministers
an equal salary, despite variations in the size of their
congregations. About one-fourth of the church's income
comes from Lewis. A minister's salary is between £950-
1,000, and the upkeep and fueling of his manse is included.
The present minister in Shawbost uses oil and coal, but at
an earlier time received loads of peat from the villagers.
The villagers bring extra food to the manse when Communions
are held, although the church donates about £20 to be used
to provide for visiting ministers.

195 The Free Church maintains a number of presbyteries,
of which Lewis and Harris are one. An Assembly is held
each year which parallels the Assembly held by the Church
of Scotland. (According to one minister of the Free Church,
"A Berlin wall divides the two.") The Free Church publishes
a monthly report of church activities and amount of money

871 Education in the local school has included a great
875 deal of religious instruction; in other words, religious
771 and educational spheres commingle. Because of the
• [465] relative prestige which the teaching profession offers
to persons from the island, and because the islands are
considered "isolated" by most persons looking for jobs
(teaching posts on the island include an added sum
which is designated as "isolation payment"), most of
the island's teachers are themselves islanders. Education
[554] is one method by which one's position in the community is
elevated. The high status derived from having advanced
education also reflects favorably on the parents and posi-
tion of the family. But teachers and others who return
to the island are expected not to deviate from island
norms in important matters, such as fundamentalist religious
beliefs; hence teachers tend to perpetuate fundamentalist
religious beliefs within the classroom.

Formerly the minister visited the school once each
871 year to examine the children on their catechism, thus
771 testing the state of religious instruction in the school.
773 Several years ago this practice was stopped by the education
178 authorities of the County Council, and the minister now
gives a sermon in the school about once a month but is
not allowed to examine the children. Many ministers are
dissatisfied with the arrangement, as they are afraid that

*159 did not receive much schooling. He stayed at home for a
long time, helping his brothers with the crofting and
weaving, and working at the nearby dairy. For a time
the brothers made concrete blocks for sale, and ran a
[162] lorry. In his late 30's and still single, Padruig went
to the mainland, where he takes on various driving jobs,
returning home periodically.

Seonag Thormoid

*159 Seonag Thormoid left the island in 1933 at the age
164 of 16 to work in the hotels. Her mother had worked in
460 domestic service before the first world war. "You were
raised with the idea that you would go away. I've
prepared my children for the same thing. Any work that
exists here is temporary. You can't depend on it. Even
though things have been good since the war, they're getting
bad now."

Seonag went to Glasgow with three other girls from
Shawbost, and stayed with her aunt until she found a job.
"Jobs were very difficult to get, and the wages were low.
These were the depressed years, which didn't pick up until
just before the war. I earned £2/10 a month working for
• [465] a Mrs. Smith. You could buy shoes then for 12/6, but
that was a week's wages. The richer families in Glasgow
had five or six servants. You were treated like scum.

*159 with his brother-in-law, but they had only one loom.
288 At that time the mill was buying yarn from other mills
in town, warping it on the mill premises, and sending
it to the weavers together with the yarn for the weft.

Ruaridh heard through the grapevine that more warpers
were wanted at the time, and went to ask "the old man,
Coinneach Rod, himself," about the possibility of his
• [465] getting the job. He worked with five other warpers, who
averaged five warps a day, at four shillings each. They
were paid by piece work rather than on an hourly basis,
and received payment once monthly.

Business was going very well. The mill was receiving
large orders from America. A few more warpers were hired.
[458] A slump came in 1948, and Ruaridh Dan and several others
were laid off. Ruaridh went to work for a building contractor,
but was called back to the mill after a month's time.

*159 After warping for several years, he started work in
444 the yarn store, which dispensed yarn to the weavers.
"I was checking the yarn that was going out to the weavers,
weighing the wefts, checking the colors that were used,
keeping a record so we could tell at a glance what stock
we had, how much we would require for any further orders
we would get. Well, the job got to a stage where I just
couldn't manage it, and I protested. Another man started
to work with me. I was paid a regular wage so it was a

*195 mainder of Scotland where, under the school boards, education
871 became both free and compulsory.
696 In Lewis the school of real significance to the island was, and
*175 still it, the Nicolson Institute, founded by Alexander Morison
871 Nicolson and opened in February 1873, supported by bequests
159 from him and his brothers. Nicolson's grandfather was the founder
of the Lewis fish-curing trade, and was also shipowner and farmer.
Alexander was the fifth of six sons and was educated in Stornoway
parish school and in Glasgow High School. He served an
apprenticeship as an engineer with Thomson of Clydebank. Later
he entered the service of the Chinese Government and established
himself with a partner of a shipbuilding and foundry business in
Shanghai. In 1865, in his thirty-third year, he was killed in a
boiler explosion in one of his new ships going a trial run. His ideal
of establishing a school in Stornoway was subscribed to by his
brothers who were a widespread family: Yorkshire, Mississippi,
Western Australia, Tighnabruaich (Scotland) and South Africa.

*195 The first headmaster of the school received £82 per annum,
871 plus the school fees, which ranged from 2s 6d per quarter in the
875 lowest classes to 5s in the highest. The fees covered reading, writ-
875 ing, arithmetic, geography, English, history and English grammar
• [465] and composition; when Latin, Greek, French and mathematics
were taught, an additional shilling was charged for each subject.
But the teacher was always bound to teach gratuitously twenty
pupils selected by the Nicolson Trustees. In 1888, the school was
handed over to the school board. In 1901, by a Decree of the
Court of Session, its name, previously the Nicolson Public School,
was changed to the Nicolson Institute. In 1898, the first boys
went straight from the Institute to university, a trend that has
not ceased since (see Chapter 8).

As far back as the turn of this century a recommendation was
*195 made for the provision of technical education on the island. A
874 report on the subject of Higher Education in Lewis (1900) stated:
871 'Regarding the practical or scientific aspect of education . . . there
is a clamant need of a central Technical School in Lewis . . . the
local resources are quite inadequate for the establishment of such
a school, or its maintenance, on an effective basis. Such popular
technical instruction as Household Economy, Wood and Iron

434 (iii) *Fishing Industry* (1953)

228 The renewed Russian contracts for herring have meant loading of Baltic shipping at Stornoway with barrels of herring [439] cured both in Stornoway and Ullapool. Catching power in Scotland generally is hardly enough to meet this contract. Thus, while the numbers of boats continued to decline after the war, leaving only one steam and 33 motor drifters (over 30 feet keel) registered by 1953, the fishermen employed rose to 610, of whom some 520 were crofter-fishermen. Many worked much of the year; on the other hand, most of the winter catch went for 'oil and meal' at about 50s. per cran instead of the top price of over 80s. For local boats a figure of £30,000 is suggested for the catch of herring, say £10,000 for white fish, [178] with £5560 for shellfish. For "curing and associated income" the pre-war figures may be doubled.

(iv) *Other Sources of Income earned in the Island* (1953)

434 In mid-1953, of just 5000 registered for the Island as 465 employed—and other than the self-employed, *i.e.* the farmers and crofters, the hand-weavers and the boat-sharing fishers—1130 earned by the three industries first named, the rest by other trades and professions, 3870 in all. The unemployed numbered 1180. Analysis of wage-rates would throw light on [657] total earnings. As to unemployment, the fact that, like crofters and many fishers, hand-weavers count as 'self-employed' means that when out of work they are not covered by unemployment insurance, and have to be helped, at low rates, by public assistance.

(v) *Allowances, etc.* (1953)

434 Turning now to Remittances, to the manifold categories of 657 Pensions, National Insurance and National Assistance, and to Unemployment Benefit (a small item), the Table B, 1953–54, 436 shows the totals kindly furnished for this study, with £1,017,110 729 for all Lewis and an estimated £977,010 for rural Lewis.

466

466 LABOR RELATIONS--respective rights, privileges, and powers of employers and employees; hiring and firing; tenure of employment; instruction and supervision; promotion and retirement; pension plans; working conditions (e.g., hours, hygienic conditions, safety provisions, recreational facilities); prevalence and types of forced labor; indentured labor; regulation (e.g., labor legislation); etc. See also:

288 attempt to preserve the image of Harris Tweed as a
463 cottage industry, and thus maintain its market value.
[438] Many weavers, politicians and businessmen argue that the weaver should be reclassified.

However, the status of weavers as self-employed is not simply bureaucratic jargon designed to preserve
288 the Harris Tweed industry. In most employer-employee
● 466 situations, people are hired with the understanding that they have certain qualifications and will perform certain jobs. Weavers are not under such expectations and obligations. A mill has little idea of the skill or motivation of the weavers to whom they send their yarn. Weavers differ in matters such as degree of skill and state of health, and they also differ in the amount of time available to weave, and other matters that affect their production. Some weavers refuse to do complex patterns; some are busy with croft work and do not want to do "urgent" tweeds; others who are recovering from illness may prefer not to weave the heavier tweeds. The
[467] tweed van sent out by the mills to make deliveries all over the island meets one such variable situation after another, and thus finds it difficult to meet the demand of the Weavers Union, that tweeds should be equally distributed among all weavers on the island. Theoretically, the mills are supposed to deliver tweeds in strict

288
● 466 rotation to the weavers who are registered with them.

Other factors also hinder equal distribution of
[602] tweeds. Personal considerations enter; for example, the managers of the Shawbost mills feel a responsibility for the weavers in their own village, who are usually kinsmen. Exclusive distribution to local weavers is rationalized by saying that the tweeds must be done urgently; hence they are distributed only to the weaver who are known to do tweeds quickly.

288 The major factor hindering equal distribution of
494 tweeds is the expense which derives from the decentrali-
466 zation of weavers, that is, the cost of petrol and upkee of the vans, which is born by the mills. Before World
[175] War II, the weavers rather than the mills were responsib
[178] for transporting the tweeds, by cart and horse at first,
[493] and then by motorized transport.

288 During this period, independent entrepreneurs
175 carried tweeds in vans and buses at four shillings each,
492 a practice which stimulated the development of public
494 transportation. Although the number of passengers using such vans and buses for public transport fluctuated, the income derived from the cartage of tweeds was in itself large enough to be profitable and to maintain the
[178] enterprises. An efficient service existed, despite the

The island, for all its ills and chills, had a high birth-rate and *175 163 165 a low death-rate. Martin Martin (1695) declared: 'It is a general observation of such as live on the sea coast that they are more prolific than any other people whatsoever.' In some areas of the island the birth-rate was as high as 35 per cent with a death-rate of about 12 per cent. The longevity of the islanders is well known, a fact confirmed by a glance any week at the Deaths columns of the *Stornoway Gazette*, regularly recording the decease of octogenarians, nonagenarians and some reaching their century.

*175 759 [751] In 1795 the island had only one surgeon. In Stornoway, 'Inoculation is performed here with success by the skill and attention of Mr Robert Millar, Surgeon.' Later, another doctor came to Stornoway, who attended to the sick in all parts of the island. By the turn of the century there were resident medical officers in each parish, with five doctors in practice in Stornoway.

*175 759 743 Just after the turn of the century, there was a medical club in the north of Harris. This had been formed by the proprietor, Sir Samuel Scott, whose crofters were supposed to pay 5s per annum and cottars 2s 6d; this subscription covered dependents. In return, Scott guaranteed the salary of a medical officer, thus securing the services of a resident doctor in the district. But there was apparently considerable reluctance to call a doctor, whether *175 759 465 the patient belonged to the club or not. The salary of the district Medical Officer of Health was £35 per annum, and from the North Harris Club he received some £200. Scott also provided 178 262 him with a home. Dr Fletcher reported in 1906 that a complete change had taken place in the diet of the people within the memory of the older inhabitants, whose accounts of what they called new diseases and lowered virility he found very interesting. Good, plain wholesome diet 'has been replaced by cheap stuff, of [272] questionable quality and purity. To this change there is another nondescript article which goes by the name of tea, in the use, or rather abuse, of which they are quite intemperate and from which they extract the last dregs by boiling. The result is disastrous to the strongest digestive system.'

*175 743 In 1892 'a well-equipped medical and surgical hospital was

HARRIS TWEED

Today, with kelp long forgotten and fishing of minor importance, it is the Harris Tweed industry which supports many of the island people, either directly or indirectly; an island cottage industry with exports earnings exceeding £2,500,000 a year. Harris Tweed is exported to some thirty countries, including America, Canada, Australia, New Zealand, Japan and all the European nations. The industry is in fact the basis of prosperity in the area, both dependent upon and supporting the crofter-weaver working at the handloom in his home. Seven million yards of tweed are woven annually by the independent weavers 'on the books' of the various mills. The weavers must finance themselves, buying their own looms and bobbins, equipping and maintaining their workshops. Though they receive their supplies of yarn from the mills, they are graded as self-employed persons and as such are not entitled to unemployment benefit—a subject which has caused much argument.

One of the most outstanding facts about the cloth is that its essential qualities have remained unchanged since the industry's early formative years. But it has astonishing versatility and over 5,000 patterns are available, including the crotal browns and the heather colours.

A weaver on average can produce about 2½ webs, or tweeds, each week, a web measuring about 80 yd by 28½ in, and gets a reward of some £8 per web, according to the intricacies of the design or the number of colours involved. The money is paid out by a mobile bank making the rounds of the townships throughout the island. It is reckoned that the mills, for their part, make 1d to 6d a yard profit, depending on turnover; the total annual value of the industry's output is in the region of £4,000,000.

Between them, the five mills in Stornoway and the one in Shawbost consume two-thirds of the Scottish wool clip—the native Western Islands' crop is sufficient for less than a month's production. A thousand pounds of raw wool end up as 885 yards of finished cloth.

sold, one such causing legal history. The chief garage proprietor in the town applied to use for his business a site he had purchased at a road junction near the western end of the town, close to the principal new housing schemes and opposite the main gate leading into the Castle grounds. It was a mistake in planning, and public disapproval began to make itself felt. The Trust, in an effort to redress the situation, sought to distrain the garage proprietor from extended use of the area. The parties went to law, and the case was fought through the courts until, in the House of Lords, the Trust finally lost and had to pay a bill of some £4,000, equivalent to a fine of £4 to £5 from every family in the burgh. The Trust drew its lesson, and since has formulated a more alert and constructive policy.

The town is well served by its shopping centre, with multiple stores jostling for custom with smaller private business concerns. Prosperity for all, however, depends on the well-being of the Harris Tweed industry. If there are recessions, as there have been in the past, the tills rattle spasmodically. Also standing to suffer are others such as the bus companies (who provide the efficient town services and link up Stornoway with the rural areas), the builders and the haulage contractors. In the ever-present climate of unemployment it is the policy of the mills to employ male labour, despite the fact that women would be cheaper. The mills, run by natives or by Lewis-born incomers of the second and third generation, realise a social obligation in recognising that in Lewis the strong tradition is that the man should be the head of the family in every sense. The mills also carry a proportion of surplus labour to offset the unpredictability of those workers who, with crofts to look after, occasionally have to take a day off 'at the peats' or some such activity. This is another of the island's distinctive traditions.

On Cromwell Street is the shop of James MacKenzie & Sons Limited, dealing in hardware, furniture and china. Nothing unusual in that, at first sight: yet it is another unique aspect of life in Lewis, being conducted as a charity for the benefit of, among others, the aged and infirm persons of Stornoway. The business was established in 1830, on its present site. In 1964, the then principal shareholder presented the building and the business as a

9 A HARRIS VIGNETTE

LIKE a Siamese twin, Harris is joined to Lewis in eternal geographical union. The junction is at the body, however; the head of each island part has always been clear to develop its own characteristic. Thus, Harris has a quite separate personality which has risen above the common factors it has with Lewis. Both have the same historical origin: the Clan Leoid. This clan comprised two leading tribes, the Siol Torquil (MacLeods of Lewis) and the Siol Tormod (MacLeods of Harris). Tradition has accorded to them a common progenitor, Leod; though by the time history in the Western Isles was old enough for the recorder's pen the two tribes, or families, were distinct and independent of each other. Malcolm, son of Tormod MacLeod, head of Siol Tormod, had a charter from David II for the lands of Glenelg, on the Scottish mainland, which he and his successors held from the Crown. Also included in his possessions were Skye and Harris, which came to his family after the forfeiture of the Lords of the Isles in 1493. The MacLeods of Harris have, rather strangely, their clan seat at Dunvegan on Skye, and are more commonly known as the MacLeods of Dunvegan or Skye, though 'of Harris' is their correct title.

The MacLeods were, by and large, good proprietors. They held much fertile land and the clan was reasonably wealthy. Tenants' rents were paid mostly in Scots money and, to a lesser extent, in such farm produce as oats, barley, cheese, butter, wedders and marts, and in labour services. When times were hard for the tenants their rents were often 'eased' by the chief in the hope that subsequent years might prove more fruitful and that the eased rents would be paid in time. In 1705, a bad year, MacLeod actually cancelled 'eases' owing by the Harris tenants, as a gesture to them. In 1712, when some disaster had visited the St Kildans (the islands belonged to MacLeod), their chief provided them with a new boat and the islanders were allowed a two-year delay in payment of their rents to help the recovery of the community.

hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

Parts of the common pasture - usually the machair, are set aside for wintering hogge but the usual practice is to keep as many as possible on the croft. The soum as a whole is not enforced but shares in the wintering parks are adhered to. For example:- Timsgarry Giebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hogge on it. In Ardroil one share allows one cow or four yearlings or eight sheep or eight hogge on the machair - in practice it is the best hogge that are sent. The minister at Timsgarry, who is much interested in sheep husbandry, has bred a heavier sheep with longer legs by crossing the Hebridean blackface with Swaledales and these seem to be doing very well; the minister is more attentive to his sheep than are many of the crofters, but some local crofters are showing interest in this crossbreed. The lambing percentage, so dependant upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.*

Enquiries show that some crofts in each township far exceed their souming but because others carry no stock the four townships are understocked according to the total soum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the sheep soum, Crowlista is overstocked by 130%, while the other townships are understocked. Some of the figures used for sheep stock were approximate or estimated. Nearly all crofts keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.

Part of the hill common west of Crowlista was cultivated until the beginning of the present century, at which time the township was overcrowded with two or three houses on each croft. A similar area west of Carnish was cultivated and old lazy beds, now grazed, are to be seen on slopes south of the road in Ardroil, in the valleys of Ambainn Thoraghain and Allt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this area, still to be seen around and beyond Loch Suainaval were in use until 1934 - '35. (Figure 5).

Ancillary employment is sought by all but nine of the thirty men under sixty-five in these townships and the wives of two of the 'full-time crofters' have regular employment. There is no commerical fishing by local boats though the Bernera lobster boats are seen frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port' shown on the O.S. map near the site of the clachan in Carnish, point to the former importance of fishing.

At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroil, three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were in use and two tweeds woven a week bring in a useful income but the supply of weaving is irregular. The future security of these weavers depends on the prosperity of the Harris tweed industry.

Mitchels's sand and gravel quarry at Carnish provides employment for from three to ten men. Five men from Ardroil and one from Carnish are employed there at present. The Aird R.A.F. station draws most of its civilian employees from Aird Uig but two Ardroil men work there. One Crowlista man is employed at the hydro-electric scheme site at Gisla and this work will last for another year or two. Employers recognise the particular needs of their crofter employees and 'days off' are allowed for sheep fanks and other necessary work.

* The minister's ewes gave 103%.

175 178 288 286 441 out in Lewis, and the Harris Tweed Association was ineffective in enforcing its standards. In 1934, weavers were allowed to use yarn spun in island mills, and production increased; but no weaving was allowed to be done in the mills. All looms were removed from those mills which had tried to centralize this stage of production. The actual process of weaving remained, by legal definition, decentralized, although the word "crofter" was changed to "islander," thus widening the category of persons who could weave "Harris Tweed," and paving the way for centralization of weavers in the town of Stornoway.

286 288 467 Any person can purchase his own yarn, weave his own tweeds, and sell them to tailors or summer tourists; but before a weaver can weave for the mills, he must be registered with the Weavers Union. The Weavers Union is a branch of the Transport and General Workers Union, which includes mill employees, hospital workers, lorry drivers, and others. It is an anomaly of the Harris Tweed industry that workers classed as self-employed should join a union of employees and is another indication of the centralization of control and power in the mills, with whom the weavers, along with the mill workers, bargain for higher wages. Weavers receive a basic sum of over £10 for each length of tweed, which is usually 38 weaver's

288 467 435 465 804

288 463 [438] attempt to preserve the image of Harris Tweed as a cottage industry, and thus maintain its market value. Many weavers, politicians and businessmen argue that the weaver should be reclassified.

However, the status of weavers as self-employed is not simply bureaucratic jargon designed to preserve the Harris Tweed industry. In most employer-employee situations, people are hired with the understanding that they have certain qualifications and will perform certain jobs. Weavers are not under such expectations and obligations. A mill has little idea of the skill or motivation of the weavers to whom they send their yarn. Weavers differ in matters such as degree of skill and state of health, and they also differ in the amount of time available to weave, and other matters that affect their production. Some weavers refuse to do complex patterns; some are busy with croft work and do not want to do "urgent" tweeds; others who are recovering from illness may prefer not to weave the heavier tweeds. The tweed van sent out by the mills to make deliveries all over the island meets one such variable situation after another, and thus finds it difficult to meet the demand of the Weavers Union, that tweeds should be equally distributed among all weavers on the island. Theoretically, the mills are supposed to deliver tweeds in strict

288 466 [467]

288 178 402 the automatic shuttle; all other processes have been built into the design of the Hattersley loom (cf. Thomson 1969). In other words, weaving does not entail very specialized skills and is not difficult to learn. A sailor can come home and learn to weave in a short period of time, or pick up the trade again with ease after having been absent from the loom for a long time. Neighbors substitute for each other when someone is ill if a tweed is "urgent." Wives help their husbands, and young boys their fathers and uncles. Such low-level specialization and substitutability are complementary to crofting activities and the maintenance of neighborhood ties, and may be seen to favor continuance of the occupation of weaving.

288 463 [591] [593]

874 286 The Lews Castle College in Stornoway, established as a technical college in 1953 in a building that was formerly the home of Sir James Matheson, offers training courses in weaving for adults which last for ten weeks and qualify a person for membership in the Weavers Union (cf. Stornoway Gazette, March 16, 1968). The college also sends weaving instructors to all the public schools on the island to instruct young boys in the rudiments of weaving. The Highlands and Islands Development Board have in the past offered loans and grants with which to purchase looms, and government aid has protected the mills.

[467] [872] 654 286 288

Research into markets and more co-operative effort, into better use of the land with less dependence on subsidies and grants, is scheduled for the Western Isles Crofters' Union. 467

Fishing as an industry, though now receiving the necessary shot in the arm by the establishment of the nucleus of a local fishing fleet, is still bothered with the perennial problem of poaching. The Minch remains one of the great fishing areas of Britain, but, it is argued, its fertility is forever being depleted by fishing inside the three-mile limit. This limit was originally chosen because it was the effective range of a cannon ball about two centuries ago. Fish, however, when they choose their spawning grounds are uninfluenced by the range of eighteenth-century artillery, paying far more attention to the nature of the sea-bed, which varies as much inshore as it does offshore. 228

POLITICAL ORGANISATION

In 1918, the Outer Hebrides became a separate Parliamentary constituency known as the Western Isles, a recognition of their geographical position in relation to the many other islands off the west coast of Scotland. Before this constituency came into being, Lewis formed part of the County of Ross & Cromarty for Parliamentary purposes, while Harris and its own islands of Scarp, Taransay, Scalpay and the isles in the Sound of Harris were included in Inverness-shire. 631

For the purposes of local administration, however, Lewis still forms part of Ross-shire (part of Ross & Cromarty), with its centre at Dingwall, the Ross & Cromarty county town; while Harris, North Uist, South Uist, Benbecula and the Barra Isles belong to Inverness-shire, and are administered from far-away Inverness. The Lewis association with Ross-shire is a historical one. When the boundaries of the Earldom of Ross were changed in 1661, Lewis went with Ross as part of the possessions of the Lords of the Isles. The present districts recognised for administrative purposes do not in fact greatly differ from the divisions, or parishes, set up after the creation of the Bishopric of Ross in the twelfth century, the Lewis parishes being Stornoway, Barvas, Uig and Lochs. The County Council attends to finances, education, roads, [175]*

468

468 COLLECTIVE BARGAINING--negotiations between labor unions and employers; strikes and lockouts; strike-breaking and picketing; boycotts; labor agreements; arbitration; etc. See also:

Contracts 676

People kept several cattle, some of which were dry most of the time. But because everyone was keeping cattle, milk could be gotten from a neighbor. One man was planting eight or nine hundredweights of potatoes before the war, some of which would be used to feed the livestock. "You couldn't buy milk then, so you had to keep a cow. And even though people were weaving, they weren't getting so much money as they are now. It was the barter system here for a long time. So they didn't have the money to buy feeding stuff. It was better to spend the time planting potatoes. Now of course there's more money in the weaving."

After the war, an act was passed which provided free milk for schoolchildren. Milk for the Shawbost school was supplied by a farm near Stornoway, and villagers first started buying the milk from the school milk van. A strike held by weavers during the war had increased the payments for weaving, and the barter system had stopped. More money was available. As the loom was more profitable, more people stopped keeping cows, and relied on their neighbors for milk, or got their milk from the van bringing milk to the school. And as the cattle got fewer, the market for bottled milk expanded. A dairy was started on the west side of the island in the mid-1960's which carries milk from Uig to Ness.

paucity of passengers, which provided rides to and from town many times a day; but with the "development," that is, the centralization, of industry, public transportation deteriorated. Visitors to the island unfamiliar with this history are struck by practices which they interpret as coming out of a clockless past, such as the present custom of stopping the bus midway in its journey to Stornoway so that the driver can eat dinner in his mother's house while all passengers wait on board. Such a custom is fairly recent, and indicates the deterioration of public services to populations which are marginal to the centralized source of these services.

During World War II, when the demand for tweed was high and the number of weavers small, the weavers staged an effective strike by which they received an increase in pay and the burden of cartage was shifted from them to the mills. This did not affect the system of transportation until the mills realized it would be cheaper to run their own transport rather than to pay the independent drivers a "cartage fee." The mills then began to use their own vans to deliver yarn and collect tweeds directly to and from the weavers. Once the mills took over transportation, they tended to deliver tweeds to weavers closest to the mills rather than to uphold the principle of equal distribution. This practice (made possible by

288 [361] houses in town and working in loomsheds behind the houses. Unequal distribution has also contributed to Shawbost's relative prosperity, and to the decline of weaving in more remote parts of the island. The [464] unequal distribution of tweeds has made it difficult to maintain a large labor force, which in turn limits the growth and development of the industry.

288 3. Instability of the Industry: The Harris Tweed
433 industry has undergone a number of crises. Periods of
178 depression have alternated with periods of prosperity.
[458] (See Appendix B for the fluctuation in the number of yards stamped each year with the Harris Tweed trade-mark.) The very conditions which give the tweed its [435] market value--the decentralized, non-mechanized human [466] element--also limit the possibilities of growth in the industry, and contribute to the industry's instability.

288 When a business remains small, it must collect
441 orders before it can provide work to have the orders filled (except when demand for an item is strong, as occurred around the time of the previous world war; during the war and for a few years after, tweeds could be made first and then marketed, because any cloth [471] could be sold). Only a large business can keep weavers

An attempt has been made in
Figs 19 and 20 to relate the size of the stock carried on
231 the individual croft to the size of holding and to the availability and age of the labour force.
311 In both diagrams there is a significant division between the subsistence holding (0 - 7 units)
464 and the commercial holding (11+ units), but there is no definite relationship between stock
471 and size of holding or labour availability. The inclusion of the points of equilibrium for
certain lines in Figure 20 reveals a somewhat unexpected state of affairs: in the case of
233 crofters with regular work and full time crofters, those over the age of forty-five carry a
162 larger stock from those under forty-five. It is frequently argued that the solution to the economic problem of crofting lies in the amalgamation of holdings in order to create a more viable economic unit, but the indication from these diagrams is that an increase in
[443] the size of holding will not, of itself, lead to an increase in stock. It is the absence of accessible markets that deter the crofter from increasing his agricultural production.

511 In their present state the crofts in the Valtos area are unable to provide a livelihood
464 for the crofter and his family. Of the crofters under sixty-five almost 90% supplement the croft income by other employment. Of these casual labour (at present mainly at the Gisla hydro-electric scheme) accounts for 57% regular work - particularly weaving - 43%. The combination of crofting and weaving provides probably the best return for the labour: one crofter with a croft of 3.3 acres, carrying two cows, two followers and ninety sheep (sixty ewes) made the following estimates for 1958:

231 FROM THE CROFT:

434

Sale of two year-old calves	£80
236 Cow and calf subsidies	£40
286 Sale of wool at 4s. 3d. per lb.	£75
	£ 195 (1)

FROM WEAVING -

at two tweeds per week (32 hrs. p.w.)	£550
GROSS INCOME	£745

434 Weaving abour 30 hours a week apparently leaves him sufficient time to run the croft
[288] efficiently; at present a crofter supplementing his income by a labourer's wage at Gisla
[464] hydro electric scheme would have to put in nearly sixty hours per week to achieve the same financial reward.

433 The economy of the Valtos peninsula has been changing, and contracting, for several
178 years. The number of unoccupied crofts is increasing; commercial fishing ended at the time of the first World War; the shielings have been abandoned as summer cattle pastures.
R28 The Valtos shielings near Loch Scanadale were abandoned during the 1939 - 45 war, due
[231] mainly to the lack of manpower in the township, though some was used intermittently until 1953. The shielings of Kneep and Reef were abandoned in the late 1930's, at which time Kneep had some fifty milk cows as compared with fourteen in 1959.

1 Against this figure, must be set the costs of production (i.e. fertilisers, new seed, winter fodder supplements, sheep dips etc.)

As far as the crofting population is concerned, the benefits are rather negligible. In fact some of the crofters of Carbost township find the presence of the distillery to be a distinct disadvantage because they must keep their "fank" in an inaccess location well off the drainage slopes which serve the plant. I should add one additional fact. Like all the major commercia ventures on the Island, the distillery is owned by a corporatio with offices in Edinburgh.

Forestry. In recent years forestry has come to enjoy widespread popularity among critics of the "Highland Problem" as a remedy for the distress, lack of gainful employment, and depopulation of the area. Within the last decade or so forestry has become a source of employment for a small number of men on Skye. The Forestry Commission acquired 9000 acres of land between Glen Brittle and Loch Eynort. Houses were built for employees and nine new families were brought in. Planting has been carried on at a rate which gives regular employment to 12 men, one man to each 120 plantable acres. As the labor required for planting decreases, the men are being shifted to thinning operations. Ultimately, they will begin lumbering. It is anticipated that in time there will be jobs for sixty or more. For every 100 acres there will be one man engaged in planting, thinning, or lumbering and five men or women working in auxiliary employment, such as transportation, mill operations, and services to the anticipate village. The government has been impressed by the success of its experiment. Another large tract, a former sheep farm,

175 On one of the crofts along the strand are the
228 ruins of two curing houses, where the fish were salted
[348] and dried. Ling, cod, skate and halibut were cured
[129] and sold to local merchants for export. "The same as
[171] they do in Iceland this very day. That was the main
175 industry. Then the English came with their steam
648 trawlers; they ruined the fishing here, and then went
228 west to Iceland and the Faroes. In Iceland they get
fined for poaching, but here the trawlers often ignore
[433] the three-mile limit. But the fishing was the mainstay
here, before the Harris Tweed came along."

195 One man returned from sailing in 1932 and bought a
228 boat for L24. He had 32 lobster pots, and made L7 one
435 June by selling the lobsters at a shilling apiece.
[154] Another man, who returned from the United States in 1934
[471] because of the depression, bought a share in a 14-foot
boat. It was made in Ness, at the northern tip of Lewis,
[184] and cost about L14. He and his partners went out every
night possible; the fish provided an important part of
their income. The boat was sold in the 50's. "It wasn't
195 being kept up anyway." Around World War II there were as
228 many as twenty boats; man fished at night, after a day's
501 work. Today there are four 12-foot boats in Shawbost,
178 each shared by four or five men. The boats are used
501 intensively for fishing during certain times of the year,

445 yards (a weaver's yard is equal to 8 feet, a measure
455 which derives from the size of the frame once used
288 to wind hanks of yarn). Payment varies according to
[604] the number of colors used in the pattern. A weaver
288 may average 2½ tweeds per week when the work is available,
445 thus earning more than mill workers. A female mill
[562] worker earns about L11 or L12, and her male counterpart
about L3 more.

Because weavers are classed as self-employed, they
288 do not qualify for unemployment benefit. They may apply
745 for social security, but must submit to a "means" test,
659 and the possession of bank savings or other assets
disqualifies them from receiving such aid. All British
workers must pay a weekly sum for "insurance stamps," a
certain number of which makes the workers eligible for
small payments from the government during periods of
illness. Self-employed persons must pay for their own
insurance stamps, whereas employers pay for the stamps
of their workers. A weaver who does not keep up with his
payments of over one pound a week for insurance stamps
must pay the accumulated debt at a later time.

471 Weavers face other costs. They buy looms and bobbin-
288 winding machines, and pay for lighting, heating, and the
297 maintenance of all equipment. The preservation of this
463 anomalous status of "self-employed" is related to the
458

175 the 1934 decision to change the word "crofter" to
179 "islander") led to the weavers living in council
288 [361] houses in town and working in loomsheds behind the
houses. Unequal distribution has also contributed
to Shawbost's relative prosperity, and to the decline
of weaving in more remote parts of the island. The
[464] unequal distribution of tweeds has made it difficult
to maintain a large labor force, which in turn limits
the growth and development of the industry.

288 J. Instability of the Industry: The Harris Tweed
[154] industry has undergone a number of crises. Periods of
[176] depression have alternated with periods of prosperity.
[458] (See Appendix B for the fluctuation in the number of
yards stamped each year with the Harris Tweed trade-
mark.) The very conditions which give the tweed its
[435] [465] market value--the decentralized, non-mechanised human
element--also limit the possibilities of growth in the
industry, and contribute to the industry's instability.

288 When a business remains small, it must collect
441 orders before it can provide work to have the orders
filled (except when demand for an item is strong, as
occurred around the time of the previous world war;
during the war and for a few years after, tweeds could
be made first and then marketed, because any cloth
471 could be sold). Only a large business can keep weavers

288 at work producing tweeds which it then tries to market.
441 The latter method requires the investment of a great deal
491 of capital to make the tweeds and pay the weavers before
a buyer is found. The small mills require an immediate
return for their capital investment, which is ensured
[434] by not investing unless there is a definite order. The
fortunes of the weavers oscillate with the luck and skill
of the mills in soliciting orders; thus, the mills do
not provide a constant, stable source of income. The
288 [434] nature of the tweed, as a high-priced luxury item rather
than a basic necessity, contributes to the instability of
the demand. When fashions change or when world-wide
economic depressions come, the high-priced tweed with
its specialized image as a cloth for aristocratic,
[138] sporty dress is forgotten for awhile. Efforts are being
made to change this image; but the product's status as
a high-priced luxury item persists.

288 An extremely small business can survive periods of
441 depression when capital outlay in the form of machinery,
459 running costs, and so on is not large. An extremely
large business that has cornered a large share of the
market can often survive an erratic schedule of orders
because it has a larger accumulation of capital, but a
medium-sized business has too much overhead to survive
long periods of depression. Examples of all three exist

ECOLOGY AND PHYSICAL ENVIRONMENT

THE CROFTING TOWNSHIP

361 The crofting township is not quite akin to the English or Low-
land village. Primarily it is a collection of dwellings of families
who, as social units, gain their subsistence from the land sur-
rounding the houses. The smallest number for a township is four
476 family units. A functional unit of four men was the minimum
necessary for a boat crew, or for the teamwork necessary to culti-
vate land; co-operation was essential if all four families were to
survive. And from this grew the same spirit of communal work
which in Lewis is seen at its best in the efforts to reclaim peat
bog and turn it into fertile grassland.

Hebridean townships come close to being the nearest approach
361 to a classless society. The shape of a township is largely dictated
[455] by the nature of the surrounding land. The shape of most of those
in Harris and in Lewis is either scattered or linear (houses disposed
in line at varying distances from each other), with little natural
[191] cover, either plantation or scrub. Often the main road runs
through the township; some have begun to develop lateral roads,
to give, from the air, the appearance of planning on a grid system.
244 Where gardens are cultivated, the produce tends to be a summer
vegetable supply for the household, little if any finding its way to
372 Stornoway shops for sale. Peat is the usual fuel, though in town-
ships near to the centres of Tarbert and Stornoway coal is burned;
the cost of freight, however, makes it expensive.

471 Most of the townships are owned by commercial companies;
individual lairds own some five dozen; the remainder belong to
public bodies, such as the Crofters' Trust. The actual distribution of ownership of
land on the island is as follows. Harris is virtually owned by in-
dividual lairds; a small percentage is owned by commercial
companies. The Lochs region of Lewis has a mixed ownership:
commercial companies, lairds, and public trust, the former being
the largest. Stornoway parish is wholly owned by public trust.
The Ness district is virtually the property of commercial com-
panies; a small fraction belongs to public trust. The Uig district
is the same, the smaller proportion, less than 10 per cent, being
the concern of an individual laird.

In Lewis, the public body mentioned is the Stornoway Trust,

THE CROFTING TOWNSHIP

In Lewis, the public body mentioned is the Stornoway trust, 471 *
the only one of its kind in the Highlands: when Lewis was sold
by Lord Leverhulme in 1923, the parish of Stornoway Landward 175*
was given to the townspeople who, in effect, became shareholders
in the trust, formed to administer the estate. A resident factor in
Stornoway is answerable to a small council of the residents. Com-
mercial companies as owners appeared on the scene in Lewis after
the lands were offered for sale when Leverhulme pulled out of his
efforts to industrialise the Lewis folk. Considerable tracts of land
were sold for as little as £500; some at 1p per acre. The salmon
and trout fishings were, of course, a major attraction. Some small-
acreage estates were bought in Harris and Lewis by speculators
with island connections.

STORNOWAY

In contrast to the straggling and quite casual townships of the rural 361
areas of the island, Stornoway has logic in its layout. The harbour
and the grounds of Lews Castle have given the town a magnifi-
cent setting and a useful green belt surround it. The outlying
villages, however, tend to be miracles of chaos, showing both
architectural and planning anarchy. These only serve to add point
to the more formal layout of Stornoway with its regular streets,
some casual variation adding interest.

The town itself grew in recognisable stages. The first was centred 361
on the small peninsula known as the Point Street area. This land 175 *
finger protected the inner harbour of the Bayhead River and on it
grew the nucleus of the town, beside old Stornoway Castle, once 504
perched on a rock-ridden and now overgrown as rubble under the
steamer pier. Protection from storm was not really provided
until the nineteenth century, when a quay was built with space for
marketing and handling herring. About the seventeenth century,
houses began to string themselves out along the shores on the side
of the inner harbour (Bayhead Street and Cromwell Street) and
on that side of the outer harbour called Newton Street. From the
nineteenth century until about 1914, two-storey, flatted tene-
ments, hotels and middle-class houses were built on a grid plan
that followed on old field layouts and the associated ditches. Some
of the present-day roads, such as James Street, follow these

FISHING

for the steamers, he thought that any improvements in connection 228
with the fishing industry should be paid for largely by the fish- 175
curers themselves—though he did spend about £1,000 on con- 504
structing fish-curing houses. Why Sir James, with his experience
of business, should have taken this attitude is not clear; certainly
the fishing industry could have been given just the right impetus
with his interest, personal and financial. As it was, the industry
was left to develop on its own lines, with odd injections from
time to time.

Fluctuating prosperity

That the potential in the fishing grounds of the Minch was
enormous was realised before 1850 by fish-curers from the Scot- 501
tish mainland. But deep-sea-going boats were needed, and so 471
new designs were called for. James Methven of Leith, a pioneer
of deep-sea herring fishing, sank capital into the development of a 228
large class of boats known as the 'Anstruther build', or in the 175
islands as 'Eastraths'. These craft served the islanders well, and 113
Lewis prospered, as did Stornoway. In the five years 1870 to 228
1875, for example, the average number of barrels of herring cured 175
at Stornoway for export was some 80,000. From 1875 to 1900 113
the average Stornoway district catch of whole fish, much of it
caught by local boats and some of it cured at Carloway, was worth
over £100,000; it was sent to Ireland and the Clyde. After 1900,
fresh-trawled fish replaced the cured and the market fell away.
In 1921, the market value of cured fish from Stornoway was
about £500. Today it is almost nil.

The herring fishing held its own, against the decline of the 228
white fish. Stornoway, as Lochboisdale in the Southern Isles, be- 175
came for a while one of the world's most important fishing ports.
Prosperity was in the air; even when the fishings did eventually
fall away, there still remained, decades later, the whiff of past
success among the neglected curing sheds, the hangdown boats in
the quays, and the silent kippering houses. From 1917 to 1935, 501
the annual landings of herrings (in crans) varied from 25,486 (in 471
1934) to 221,519 (in 1927). In that year, a record one, it was
reported that 'even landsmen could hear the roar of herrings in
Loch Eriport. So dense were the shoals that their progress in the

195 rent averaging 31s., in addition to which there were over
473 1000 houses of the cottar class and 300 houses of the squatter class.

Lastly, Sir James trained no successor to follow up or improve upon his experience. But in death in 1898 Sir James was succeeded by his widow, and, nearly twenty years after, she was followed by a nephew and his son. But the expenses of Stornoway Castle and its burdens, accompanied by lower rents, weighed down the new proprietors.
[228] In 1918 the estate was sold to Lord Leverhulme, who shortly afterwards purchased Harris too, with a view to his great schemes of fishery development.

(c) FISHERIES: 1750–1919

195 For the greatest expanding industry of the northern
471 coastlands, Matheson had done comparatively little even
228 at Stornoway. In 1883, a former Factor (Mr. Mackenzie of Calgarry) stated that he had constantly asked for aid to the fisheries, especially by the building of harbours, pointing out that the landlord would reap benefit in rent.[1] But Matheson had replied that the fishermen and fishermen, the people engaged in the trade, should do this work
[654] for themselves. By the end of the century, harbours were being planned and built with State aid in the north, west and south-east of the Island (at Ness, Carloway and Uig,
[439] and Tarbert, Harris). In 1900 the Islanders possessed 150 herring boats, and in that year five boats from the Stornoway District sailed for the first time to Yarmouth,
[511] and from 1900 to 1914 inclusive, in most years there were
[113] 700 boats that participated in the herring fishery.[2]

[1] *Royal Commission on Housing*, 1917, p. 212. Cf. *Fraser Report on Cottars in Lewis*, 1888, and the recommendations by the Scottish Housing Advisory Committee, *Report on Rural Housing in Scotland*, 1937, pp. 56–63, 75–77.

[2] Brand Report (1902).

195 From the Napoleonic Wars to 1914 the amount of
228 herring cured on the West Coast of Scotland rose and fell.
251 In 1810–14 the East Coast cure was half the West Coast
471 cure, but the peace of 1815 brought the capture of the
458 Continental markets and the East Coast herring export leapt up. It averaged 500,000 barrels from 1850 to 1870, a million from 1880 to 1900, and one to two million barrels
[439] until 1914. With the decline in export to the Mediterranean, the West Coast export fell, to rise by 1890 and reach a peak from 1900 to 1914. Thus, although no more than from a tenth to a fifth of the East Coast yield, that of the West Coast had risen greatly.[1] Of this, the Stornoway
195 cure formed the major part.
228 The chief early type of catch, of white fish (cod, ling and hake), was developed too, and swelled to a peak by 1900, then dwindled and fell. The average Stornoway District catch of white fish for a dozen years to 1900 was valued at over £100,000, much of it caught by local boats, and some of it cured at small 'creeks' (*e.g.* on the west of the Island, on Loch Roag, notably at Carloway). The cure, a strong coarse food, was shipped to Ireland and the Clyde; but after 1900, fresh trawled fish replaced the cured. From £100,000 before 1900 the value fell to little
[654] over £10,000 in 1912–13, £1000 in 1920, and half that in
1921—½ per cent of the value in 1900![2]
[470] Thus the herring fishing became the most important
[511] to the Islanders, at first by employment on East Coast boats.
[652] Later they purchased boats and gear for themselves, helped
[113] finally by the advances from Island and East Coast curers, through also by State loans.

[1] *Fishery Board for Scotland*, Table 25 (1918), and Table 23: 600 barrels in 1790–95; 80,000 in 1870–71; 1000 in 1912, and 160,000 in 1913. For fair comparison with Table 25, about 25 per cent should be added to quantities, as explained in the notes to the Tables, on the 'assorick' and final reduced, or 'bungaached', state of barrelled herring (listed in Table 23).

195 though also by State loans. The efforts of the Island
228 fishermen in the sixty years from 1880 to 1939 can be
471 summed up in the values of their boats. From 1880 to
458 1900 values rose by one-half, but had fallen somewhat before the war of 1914–18 (to £20,000). Immediately after, the purchase of steam drifters at Stornoway and the fitting
[439] their herring boats with motors by the fishermen had tripled the value (close on £70,000 in 1920). But markets fell almost at once, and losses continued. By 1938 the Island fishing fleet was valued (or overvalued) at a quarter that figure, and was worth less than the fleet of sixty years before.[1]

(d) THE CROFTERS ACTS, 1886–1919: TOWNSHIP, LANDLORD AND STATE

195 Centuries of cattle-keeping having left the grass moors
236 in good condition, the profits of sheep-farming rose after
1770 with the price of wool for manufacture. Protected from foxes by modern guns, and handled in large flocks, the newly introduced Cheviot and Blackface sheep and
[178] lambs could graze in their thousands. In many estates the introduction of sheep, additional sheep, with the cattle, was tried and worked; but in others the people were
195 ruthlessly evicted. Although offset by many acts of wise
236 economy and generous aid, evictions were too frequent
427 during the next half-century, and they engendered growing bitterness.

Whereas in other Isles, and on the machar of Harris, the small joint tenantry and subtenantry were evicted in

[1] Figures 1828–33 quoted from J. P. Day, *Public Administration*, 1918; 1888–1900 from Appendix H, Report, 1901; 1912–1938 from *Fishery Board for Scotland* Tables (Table E-H, 1924–31, and Table 15 and A.1, 1938).

311 illustrates the narrow margin of habitability on these frag-
241 mented holdings.
423 Now, in Lewis periodic pooling and exchange, or the practice of *movable* run-rig on the small joint-tenants' farms, was abolished early in the nineteenth century, except
[473] upon the machar, where it still continues. Apparently the
[195] strips were simply fixed where they had last been appor-
[241] tioned by lot. Subdivision of the crofts among sons
[176] and grandsons followed, owing to inheritance without reclamation. Fairness gave 'the patchwork quilt' described;
[175] but it was fairness pushed to the point of folly, for differences in soil from one adjacent strip to another were slight! It is otherwise with the long, narrow plough-strips which run from the houses on the pure boulder clay down to the sandy shore; and run-rig, movable or fixed, is understandable and necessary there. The case just cited shows how a sensible communal tradition, such as that of '*movable* run-rig' with periodic pooling, may degenerate into absurdity by fixation. Happily the machar still shows the sane maintenance of a tradition, the pooling of resources.[1]

In 1924–25, widespread distress in the Isles, the failure
182 of the Leverhulme endeavour, the crofters' refusal to own
261 their own crofts, and the emigration which followed, caused
[178] lambs could graze in their thousands. In many estates the many outsiders to forecast rapid depopulation. It was all
182 the more interesting to note the confidence in the Island's
261 future shown by buyers of the great estate, all of whom
471 knew what they were about, for they were men with experience of the Island, of its rates and rentals and of its people. To a wealthy man who repurchased a sporting

[1] Apportionment of lands held in run-rig in the Carloway estate is described, and the principle, in Sir John Sinclair's *Agricultural Report*. (See *Scottish Law Rev.* vol. 28, 7; July 1912, pp. 51–54.) At the same time 'mechanization', or the co-operative utilization of implements had led to plan for 'collective farming'. (*Stornoway Gazette*, February 1944.)

182 After the first World War re-settlement schemes went ahead with renewed vigour.
261 Men serving in the Forces expected land to be available for them on their return and they
[178] were impatient to get it. By this time the Lewis estate belonged to the Lewis and Harris
[182] Development Co., in other words to Lord Leverhulme. The farms of Medistay, Ford,
[471] Cornish and Aird were all without tenants; Leverhulme agreed to break them into
[178] crofts, the lots varied in size from quarter-acre upwards, equipping the work, and the new settlers were able to commence cultivation on March 1, 1921. Timagarry farm, with which was the Big Shooting lodge, was in the hands of a tenant; but the Board obtained possession, reserving a small area around the lodge for amenity. Carsaig farm, Bernera, was also broken up. More than 50 new holdings received enlargements to their common pastures; details are given in Figure 10 and table 8, (pages 22 and 23). The schemes were done in haste, the Secretary of State for Scotland pressed them forward in the face of some opposition from Lewishmen. Here, as elsewhere, the ex-servicemen were restive; land raids and violence, with industrial unrest, occurred in Lewis.

In 1924, Linshader farm was threatened by land raiders. As a result this, too, was broken up and 16 new holdings were occupied as from Whitsuntide, 1925. This was part of the Grimersta grazing estate and the proprietors required that all the pillaes be given crofts. Linshader was not particularly suited to crofter-management: it consisted of 49 acres of old arable land and more than 8,000 acres of rough pasture, the furthest part of which was five miles distant and without road access. When the Land Court fixed the running the following remark was recorded:

> "Under a cleh stock" (i.e. a single flock) the more "might have been exploited to a very different extent, but in view of the fact that individual stocks are to be kept" (i.e. each crofter his own shepherd) "which is not conducive to profit, 70 sheep per share will be ample. If the whole outside ground were being fully made use of by the sheep stock the grazing of ten cows should be sufficient to maintain . . . but the wintering afforded on the inbiggs does not justify a larger summing" (than one cow). It had, in fact, been the practice at Linshader farm to lay in young cattle for summer grazing, and to send away the lambs to the Dingwall area for their first winter.

Thus, examples show that, while the defeat, or non-
182 realisation of Leverhulme's schemes, seemed to many out-
450 siders the beginning of a not distant 'end' to the Island community, the Islanders themselves did not contemplate a final exodus. They were quite uncertain what was to come, it is true. Who was not, in those years of discourag-
182 agement for Scotland and her people, for Wales, for
261 Ireland and Scandinavia? The years of Leverhulme's departure from Lewis and of his death brought bad seasons. In 1924 storms destroyed crops and the peat would not dry. Herring catches and prices, though, they had risen a little since 1921–22, had not allowed recovery from the losses sustained. The cessation of Leverhulme's wage-payments
[182] meant a gap in income which the Islanders could not fill
[194] at home. To relieve poverty in 1924–25, a Highlands and

195 Estate of the sporting estates of Grimersta, Scaliscro, Morsgail and Uig Lodge, on some
[471] of which a few cattle and sheep may be grazed, and a few small farms.

[182] There are 17 crofting townships. In area they extend from 7,000 acres (Linshader)
311 to 1,000 acres (Crulivig, excluding the farm shortened in Bernera Shooting). The number
241 of crofter tenants ranged from 4 in Unghadair and Earshadir: 6 in Breascleit, and the
[427] average amount of land occupied to each crofter is 7.2 acres of inbye and 126 acres of
[163] common pasture (table 10). Averages are misleading. As the table shows, between distinctive the amount of land available per crofter varies from about 90 to 900 acres; as between townships the range is even wider (table 11). To some extent this contrast is the result of re-settlement after the Second World War, when some crofters received holdings sufficient to yield a living family. The extent to which they were successful in this respect was limited by physical weaknesses, the lack of capital, and the farm's maximum number of holdings. Nevertheless the re-settled holdings have twice the average area of both inbye and common pasture (11.3 against 7.2 acres, and 225 against 126 acres, respectively).

TABLE 10

Average acreage of land available for each holding and working unit.

	INBYE LAND.		COMMON PASTURES.		NUMBER OF:	
CROFTING DISTRICTS:	1938	1948	1938	1948	1938	1948
Atlantic Coast	4.7	8.8	285	529	51	28
Big Port	5.1	16.8	255	325	42	43
Valtos-Reef	5.4	7.8	118	171	74	51
Little Loch Roag	7.6	11.8	116	138	35	35
Bernera Island	12.8	13.8	86	93	91	84
Bernera Shore	13.3	13.3	484	484	26	26
East Loch Roag	14.7	15.8	116	116	136	136
Loch Carloway	4.7	5.3	52	58	174	155
Non-crofting holdings	17.8	17.8	-	-	23	22
Lewis	7.2	9.0	126	157	699	580

NOTE: The distinction between 'holdings' and 'working units' is explained in the text.

427 Even amongst the old-established townships there is a tremendous range in amount of
[163] land available per tenant, the southern districts being best placed and those in the north
[163] worst, a situation which still remains. Indeed, the contrast in land available as between
[163] tenants (table 12) is even greater than that between townships, the average reported by a corresponding contrast in stock carried. Together with the rarity of effective fences between or within pastures, this contrast underlies the problem of grazing control, of the extent of bitter when each crofter keeps his own little pasture, and the excessive sheep/cattle ratio, this gives rise to serious problems which will be considered in Part III.

in Shawbost: a very small business, which until recently did not even have its own transport but hired facilities when they were needed and simply went into hibernation when orders stopped coming; a medium-sized business, which went into liquidation in 1971; and a large business, which continues to survive despite a depression which has continued since the late 1960's.

Harris Tweed is sent to markets all over the world; but because of the difficulty of maintaining a large labor force, the filling of orders is sometimes slow. If large orders cannot be met, weaving as an island-wide occupation cannot be maintained. The number of weavers on the island fluctuates, as slack periods come and men adopt the time-tested strategy of temporary migration in search of other jobs. One of the factors which aided the weavers during their strike of 1943 was the fact that so many other jobs were available during the war that the future of the industry was jeopardized.

In the last five years the number of mill employees as decreased from 800 to 500. The decrease is due in art to the introduction of more efficient techniques nd new equipment, but there is little room for improve-ent in the production of tweeds because the human lement, the weaver, is essential to its production.

Chapter 3

CHANGING ECONOMIC STRATEGIES: LAND, SEA AND LOOM

178 288 128

In Lewis, the change from a relatively self-sufficient community in which land and sea provided the economic base occurred in the context of the phenomenal rise of the Harris Tweed industry. In the following pages, the history of Harris Tweed is discussed in relation to changing strategies involving exploitation of land, sea and loom. Associated features of social life are discussed. Social boundary systems are defined and discussed in Chapter 4.

A. The Sea

175 228 [501] [471] [454]

Around World War I, nine boats, as long as 27 to 30 feet, driven by sails, used to go out regularly from the Shawbost harbor. From five to seven men, usually neighbors, had "shares" in a boat. They would go out fishing during the night and return the next day. "We [433] baited our lines with eel, for ling. We would catch maybe two or three hundred. I remember once we caught 1300."

20.1-50	29	24	940	10	10

Note: 'New' townships, for this purpose, are those settled since 1900.

In detail the arrangement of the townships varies. Certain features are common: all inbye land and, consequently, all settlements, are coastal (except Lochganvich). Each has common pasture adjacent to the inbye and many have further areas of common - former shieling grazings - some distance inland (figure 1). This division of the hill grazings is to some extent nominal because fences are often absent or ineffective. Uninhabited islands, on the other hand, require no fences, and are particularly valuable for winter grazing; the smaller of them provide convenient natural paddocks for bulls and tups when out of season. The management of all these common pastures is controlled by the township committees. Unfortunately the most important aspect of stock management - control of numbers and maintenance of a proper balance of sheep and cattle - is almost universally neglected.

The total stock which each croft may put on the common pastures - the 'soum' - is defined in the Regulations. In the case of townships re-settled in the present century a specific soum is placed on each croft but, in most other cases, the old practice persists of stating the soum in terms of rent. Thus the soum of each croft may be defined as 1 cow, 1 two-year-old and 8 sheep per pound sterling rent (this is a very common souming). Such soumings have been in existence since time immemorial; they are mentioned in 1836*. Many of the Uig townships had their soumings stated by the Land Court in 1912; in most cases the soum was given "per pound sterling of rent" (presumably 1912 rent), but in a few "per pound sterling of rent payable in 1886". The rents had been substantially reduced in 1891, thus 1912 and 1886 rents were very different. Any township has a certain limited, stock-carrying capacity; therefore, if the total rental is thus changed without

121 1794, for instance, their crews not only fishing but also
175 buying from local fishers. Islanders occasionally earned
228 a pittance as pilots, for until the charting of these rocky coasts navigation was most dangerous.

175 The herring industry was in the hands of 'adventurers'
228 (who 'ventured' their capital), and the Islanders benefited little. The British export was aided by a bounty which
• [472] helped to capture the Continental market; but, as Adam
[439] Smith pointed out, no bounty was given to the small, open boats suitable for the north-west lochs. Thus the operation
175 of the Salt Duty after 1707 and of the bounty system from
228 before 1745 until 1786, illustrates two of the recurrent
656 blights upon "Public Administration" in the Isles. As Day wrote, their interests have had to suffer "either deliberately, for the benefit of other parts, or other classes in the kingdom, or inadvertently from ignorance".[1] Although the bounty system was widened to include small boats after 1786, the Salt Tax remained until 1817.

To overcome difficulties, the British Fisheries Society was founded with Government support in 1786. Although Stornoway then seemed too far afield, the Society's concentration upon larger settlements foreshadowed Lord Lever-
[311] hulme's principles after 1918. At Ullapool, Tobermory and Lochbay (Skye), and at Wick, quays and stores were constructed and dwelling-houses built, with croft land and grass for a cow, to be reclaimed. Although concentration at Wick led to the sale of the three western properties about 1842, the Society had done some good work in the West. The chief difficulty of the West Coast north of the Clyde area and south of Stornoway District remained: the lack of a well-marked seasonal migration of herring.

finished cloth. About 1,000 workers are employed at the mills, 288
representing about 95 per cent of the island's industry—not count- 464
ing, of course, the 1,200 or so self-employed weavers. The Shawbost mill, started in 1915 in a very small way, employs about seventy people from the surrounding crofting community on dyeing the wool, carding it and spinning it into yarn, and has about 500 weavers on its books. In 1955 it became a limited company [473] •
and a £35,000 finishing plant was added; other recent extensions have been made to the tune of £70,000. The establishment of such a large industrial complex in one of the remotest parts of Britain is an achievement to be underlined.

The early cloth industry

Coarse woollen cloth has been made in the Hebrides, as in 288
other rural Highland areas, from time immemorial. Rents were 175*
often paid in blankets or plaiding. In 1656, 'pladding' was one of [427]
the items of trade brought by Highland boats to Glasgow for sale there. In the late eighteenth century, blackfaced sheep were intro- [236]
duced into the Highlands and islands; the fleece from this breed was much heavier than that of the native sheep and consequently proved ideal raw material for local woollen manufacture for trade. In the Hebrides, the product was mainly for domestic and [438]
local consumption. The people of Harris, however, were well [439]
known for the excellence of their weaving which found a limited external market. In 1844, the Earl of Dunmore, the first non-native proprietor of Harris, had the Murray tartan copied in tweed by local weavers, so successfully that the Earl and his enterprising wife encouraged improvements in the product and introduced it to their friends. The cloth, ideal for outdoor pursuits such as fishing and stalking, found ready wearers. In 1857, [444]
an Edinburgh lady went about getting orders for the Harris weavers, and business increased so much that in 1888 she moved to London and opened a small depot for tweeds.

Thus by the time the nineteenth century had reached maturity tweed was becoming well known, and weavers and local merchants, usually shopkeepers, developed sales contacts on the mainland. At that time every web of tweed produced was unique: it could never be copied exactly. This of course added to its charm

241 grazing land and he could not transfer such property in
175 a will. Similarly a crofter had no right to his buaile,
423 and could not formally protest if another crofter sought to apportion this land for his own use (see Chapter 2
[827] for a discussion of apportionments). But in both situations, informal understandings superseded legal rights.

241 Various legislative acts which followed the 1886
657 act focussed attention on the crofter. Various matters
175 associated with crofting are handled by a Crofters
[654] Commission. Crofters have access to grants and loans
• [499] to improve land and build fences and homes. They may buy goods at low prices in a nearby cooperative store. As crofts were fenced, land around the townships became scarce and non-crofters found it difficult to keep large numbers of cattle and sheep.

241 Within recent years it has become possible for non-
178 crofters to gain title to the small plots of land on
423 which their houses are built. Some loans are available
[452] to them for building houses. Non-crofters have access
[654] to the various subsidies available to all agriculturalists such as the subsidies for raising hill sheep and beef
[829] cattle. There is still the feeling, however, that crofters have rights which non-crofters do not have and that in conflicts over scarce goods crofters have

476

476 MUTUAL AID--cooperation in economic activities (e.g., mutual aid); exchange of services; cooperative work groups; material and social rewards of cooperation; interaction and relative elaboration of cooperative and competitive activities; etc. See also:

175 423 427 Thus some tenants were relatively more prosperous than others. A large class of subtenants (scallags) did corvée labor in return for a small amount of arable land and the right to graze a few livestock. Their land was intermixed with that of their masters in the prevailing system of run-rig. "Crofters" had economic standing similar to that of scallags, but had permanent, compact allotments (Gray 1952: 49).

C. Joint Farm vs. "Crofting Township"

[632] The 1726 rental indicates that the "town" of Shawbost was a corporate unit and thus that "crofting townships" have a long history. However, Geddes (1948) argues that the form of the 1726 rental was due to the method by which it was collected. In 1726, officials toured the island and made a list in large public hearings of the rents of those assembled, thereby attempting to make certain that no tenants were excluded from the rent roll. The major cooperative work unit seems to [464] have been not the township but the joint farm, which [476] contained enough men to make up a crew for ploughing and fishing.

171 175 241 427 In the Lothians and eastern Lowlands, the land could be worked in larger units than in the Highlands, and a

171 175 427 241 typical homestead or "farmtoun" consisted of a "ploughgate" occupied by eight tenants, each of whom contributed one animal to the common plough and thus had an eighth of a share of land or one "oxgate" (Grant 1930: 97).

175 427 241 [476] [407] In the Highlands and particularly in Lewis, about four to six men and their families worked together and shared land which was held in run-rig. The Old Statistical Account (1796) lists 90 ploughs in the parish of Barvas or about one plough per five families (Geddes 1948: 57). Geddes maintains that joint tenants

175 427 241 114 233 paid an equal share of the rent and had equal "soumings" (the number of stock allowed on the common grazing land). In contrast, Walker (1812: 56) says that joint tenants paid different rents according to the share which they had in the arable land, and that the number of cattle which a tenant had on the common grazing land was soumed or proportioned to his rent; all the tenants worked the arable land together, and received a percentage of the produce which was appropriate to their share. Geddes' description (1948) emphasizes equality within the joint farm; Walker (1812) and Gray (1952) point to differences between tenants and subtenants.

241 654 continuing investment in crofting activities is the availability of various subsidies which, in the form of fencing grants, calf subsidies, and so on, are available to other agriculturalists as well as to crofters. The certainty of support which subsidy offe is important in the decision-making of crofters becaus of their generally fluctuating, low-level income, in contrast to the decision-making of farmers who keep sheep or cattle on a large scale. The latter are like to be more affected by market prices. Many Lewis crof [648] indicate that they would hesitate to support Britain's entry into the European Economic Community, despite th higher level of prices for beef, because their subsidi might be jeopardized. Subsidies can be important as incentives for specialized production, but do not them selves sustain crofting as a socioeconomic pattern. [178] And in general, despite the incentives, all agricultur production is declining in the face of more appealing alternatives available to the emerging generations.

178 241 476 A decline in township communalism, or an increase in the individuation of agricultural practices, is another index of change in economic strategy. The fencing of individual land and purchase of personal farming machinery are everyday occurrences in the life

175 441 452 went away to the fishing, their families bought groceries on credit. "If the merchant thought the fishing season would be good, he let them have as much as they wanted; otherwise he restricted them in their buying."

288 175 159 444 437 472 The barter system continued in Shawbost long after it stopped in Stornoway. A weaver was given credit in Coinneach Rod's store, until it closed in 1948, for the exact amount of the tweed. He never gave money. "You had to get just the right amount of goods, even down to tuppence in matches." People were forced to buy huge jars of jam which they did not really want or need. Some "cunning" fellows would slip a two-pound pair of shoes into a shoebox marked 15 shillings. "Coinneach Rod would ask if you wanted a wireless, or would a tweed jacket fit your son. You couldn't refuse, or you wouldn't do any weaving for him for long time."

288 175 159 472 452 Coinneach Rod bought looms for many weavers, and they would weave only for him to pay off the debt. "People living on the dole with a large family would go to him and ask him to buy them a loom. He would get the man a loom, and then get him a lot of tweeds to weave so the man could pay him off. It was two tweeds for yourself and one for the loom."

288 175 441 2. Centralization and Specialization: Centralization and specialization in handling the production of the tweed

288 466 rotation to the weavers who are registered with them.

Other factors also hinder equal distribution of [602] tweeds. Personal considerations enter; for example, the managers of the Shawbost mills feel a responsibility for the weavers in their own village, who are usually kinsmen. Exclusive distribution to local weavers is rationalized by saying that the tweeds must be done urgently; hence they are distributed only to the weavers who are known to do tweeds quickly.

288 494 466 The major factor hindering equal distribution of tweeds is the expense which derives from the decentralization of weavers, that is, the cost of petrol and upkeep of the vans, which is born by the mills. Before World [175] [178] [493] War II, the weavers rather than the mills were responsible for transporting the tweeds, by cart and horse at first, and then by motorized transport.

288 175 492 494 During this period, independent entrepreneurs carried tweeds in vans and buses at four shillings each, a practice which stimulated the development of public transportation. Although the number of passengers using such vans and buses for public transport fluctuated, the income derived from the cartage of tweeds was in itself large enough to be profitable and to maintain the [178] enterprises. An efficient service existed, despite the

288 paucity of passengers, which provided rides to and
175 from town many times a day; but with the "development,"
178 that is, the centralization, of industry, public trans-
472 portation deteriorated. Visitors to the island unfamiliar
494 with this history are struck by practices which they interpret as coming out of a clockless past, such as the present custom of stopping the bus midway in its journey to Stornoway so that the driver can eat dinner in his mother's house while all passengers wait on board. Such a custom is fairly recent, and indicates the deterioration of public services to populations which are marginal to the centralized source of these services.

288 During World War II, when the demand for tweed was
175 high and the number of weavers small, the weavers staged
[468] an effective strike by which they received an increase in pay and the burden of cartage was shifted from them
[178] to the mills. This did not affect the system of trans-
[494] portation until the mills realized it would be cheaper to run their own transport rather than to pay the independ-
[493] ent drivers a "cartage fee." The mills then began to use their own vans to deliver yarn and collect tweeds directly
175 to and from the weavers. Once the mills took over trans-
288 portation, they tended to deliver tweeds to weavers
178 closest to the mills rather than to uphold the principle
[494] of equal distribution. This practice (made possible by
[466]
[361]

463 One of his
326 apprentices was his sister's son, who built another
[874] smithy not far away. "This was the center of gossip.
[604] People gathered there while he shoed horses that came
[521] from Barvas to Carloway."

444 A number of shops were established in Shawbost
178 that sold clothing, cooking ware and groceries. At
[494] one time they numbered six altogether. These shops also ran the first buses between the village and
[477] Stornoway. Gradually these businesses disappeared
[443] because of competition with larger companies. Mobile grocery vans and butcher shops and bakers began coming in the late 50's, and gradually took over the trade in large parts of the island, undercutting the local busi-
178 nesses. Income from weaving had already weakened self-
434 sufficiency derived from the intensive use of land and
571 sea and also weakened the formerly heavy reliance on
621 local ties and mutual aid. Today an army of town-
44 dwelling entrepreneurs and employees constitute a major
463 proportion of the traffic on the island roads. Grocers,
178 fish dealers, bakers, sellers of soft drinks, garbage
472 collectors, insurance salesmen, mobile banks, coal
[484] dealers and others extend goods and services from centralized sources to a market which has money to pay for them. The island's participation in this extensive market system is affected by its marginality to the

311 who wanted to keep his bullock on the reseeding for
233 another week because he wasn't ready to sell it; but
232 he should have known the rules. Some people want to
829 keep both cattle and sheep on at the same time, although the agricultural advisor says cattle should go on first, because sheep go for shorter grass. Other people want to put on twice as many sheep as those who have both cattle and sheep. When they stop keeping cattle, they think they're not getting a proper share of the reseedings.

"The Crofters Commission wanted communal township schemes. But people have different demands. It's better to go for an apportionment. You can do what you want with your own land."

178 The number of township members participating in
311 the communal schemes is diminishing to the point where
232 it is less expensive, and much less subject to conflict
423 arising over differences in stock-keeping, to invest in
476 individual holdings of land rather than try to sustain communal practices.

264 The only occasions on which it is customary to feed
574 someone an entire meal is at a work party, such as peat-
576 cutting. On such occasions the preparation of meals is
[461] done in an atmosphere of competition and mutual scrutiny,
[476] and the meals are often elaborate. At other times, the requirements of etiquette can be minimally fulfilled by giving foods which are still relatively abundant, but which were much more abundant when the land was cultivated
[262] and cows kept. Such foods are barley bread, oatcakes,
264 clotted sour milk, cream and fresh butter. These foods
571 are usually offered to visitors along with tea, and in the
574 past this custom served to minimize the economic disparitie between villagers, to spread scarce resources. A similar
[737] function was served by the practice of giving part of
[431] each catch of fish to old widows and other villagers in need of aid. Even though food is more abundant and divers today, the taking of tea, and especially food, during a visit is still very important.

173 A 50-year-old man who "married into" a croft recalls,
[581] "I came from a family of ten children. Everyone had to
[428] leave, or marry a girl with a croft. Only the eldest son could inherit the croft." There was little room for
423 romanticism in the fight for scarce land among the sons
581 of large crofter and non-crofter families. "The most

233 As these quotations bring out, the subsidy enables
654 people to risk rearing cattle under conditions that would otherwise make success very uncertain.

476 5. Communalism: Despite the decline in various
571 agricultural activities and the individuation of land use, some activities persist which require mutual aid.
[484] Conditions of low geographical mobility, in which mutual watchfulness and competitive gamesmanship have developed (see section on "Social Marginality"), contribute to the strong boundedness of the township network. There is still competition over who begins an agricultural
[156] activity at a particular time of the year. No one wants
[221] to be so early that he stands out like an over-eager novice running risks of frost or other bad weather, but there is an element of pride in being the first to
314 harvest potatoes or bring in the peat. Almost everyone
571 cuts peat, a time-consuming and back-breaking job made
476 pleasanter with a large labor force; and every aspect of the activity--the time of cutting and bringing in, the length of time required to cut peats, the size of the peats when dry, the type of meal served to the work crew, the evenness of the final peat stack--is subject to intense scrutiny.

121 of the township with the larger society, and examines
128 the effect of geographical and social marginality on the boundedness of the township network. Chapter 6 discusses two important networks of social relations within the township.

B. Township as Social Boundary System

632 The township constitutes a relatively firmly bound
178 system, although its boundaries are weaker than formerl
621 when the township was relatively self-sufficient
[476] economically. Township members worked together in smal fishing crews, and families relied on each other for help when members of the family were away from the isla "at the fishing."

621 Relatives were expected to give priority to helpin
476 each other. According to one proverb, "A relative is
602 your best friend." First and second cousins were
[539] considered especially close, but knowledge of one's
[605] kinsmen extended to at least the fourth generation.
602 Ties of kinship became evident in ceremonies such as
576 funerals and weddings. One Gaelic proverb says, "You
585 know who your relatives are at weddings and funerals."
764 At weddings the onus was on the members of the bridal
[539] party to remember their relatives. "You have to sit and calculate who is closely related, and all those

175 continued to take. "He was planning to start some
159 business. At one point it was going to be either
472 distilling or the tweed, and he just happened to go for the tweed."

Some say Coinneach Rod had physical disabilities, developed or aggravated by military service, which made him unable to work like other men, and hence he was forced to find other ways of earning a living. He was a merchant, like other islands who became entrepreneurs in the tweed business.

According to one version of Coinneach Rod's life, he began to handle tweed on a large scale as the result of an accident, when an agent selling tweed for a merchant on the east side of the island arrived on Lewis for the first time, asked for a "Kenneth Macleod, merchant," and was directed to Coinneach Rod of Shawbost.

"He was also an earthy, natural, easy man to get on with. He never changed, even after the money came. He would sit the buyers down with a plateful of cuddies and say 'Dig in,' 'Eat up.' He always ate them whole, and never spat out the bones. The buyers liked that. They liked his easy manner."

a. Fencing:

233 Although run-rig was replaced by fixed, compact
(178) holdings, the method of animal husbandry was not affected
(419) until the land began to be fenced. A single dry-stone
(333) dike enclosed the township, keeping livestock on the moor and away from the arable land. In different parts
(184) of the Hebrides, various types of herdsmen were hired to protect both the livestock and the growing crops (cf. Owen 1958-59 for a discussion of cattle, calf and sheep herdsmen in North Uist).

175 The township Constable had a great deal of power,
625 which included the right to evict people from their crofts, to enforce rules of good husbandry. The last Constable of Shawbost, who died at the turn of the century, has been credited with a number of ignoble actions, such as forcing an old woman with a sore leg to take her cow to the moor along with all the others. Old widows who had no one going to the fishing and hence no means of paying their rent might be evicted in favor of other persuasive, land-hungry members of the village.

(c) FARM-TEAM AND BOAT'S CREW

The strictly equal division of rent on each joint farm shows the equality of sharing among its workers by 'run-rig'. By this system, periodic pooling and redivision kept the land in convenient blocks, a wet part here and a dry one there, all shared out to give each man an equal chance whatever the weather might bring. Such sharing was not mere static division of goods: it was the means for co-operative work, in ploughing and harvesting, or cutting peats, on land, and in manning a boat for the fishing.

For ploughing, two or three men were needed—one leading the horses (walking backward and singing his encouragement), a second to hold the plough and perhaps a third to turn the sods; but four ponies abreast were needed to haul the plough, and each tenant possessed only one or two. In addition, the plough might be preceded by an instrument to clear the ground, a 'reestle', requiring two horses and one man. A Gaelic proverb notes the selection needed in the horse team, and one disabled by age could be replaced as leader by another. Ploughing was necessarily co-operative.

The rockiness and hilly ground of Uig and Lochs diminished the usefulness and, no doubt, the number of ploughs, but the importance of their fishing was some compensation for poor agriculture. In 1790 there were ninety ploughs in Barvas parish, where they were no doubt of ancient usage: a ratio of one plough to five families, or one per joint farm. To judge from the smoothness of Stornoway parish, ploughs were probably used there in a similar ratio.

While some jobs were done by no more than two people, —as when a ridge or 'lazy-bed' was put in order, the

couple advancing one on either side of it—many other tasks were definitely team-work. Such was peat-cutting. "When they are making peats, five people are employed. One cuts the peat, another places it on the brink of the ditch where it is dug; a third spreads it on the field, a fourth pares and cleans the moss; and a fifth man is resting, ready to relieve the man that cuts. The women are seldom at this work, but the men help one another alternately; sometimes they must rest satisfied with fewer hands; but the above is the full complement of men required to perform the work, according to their tastes." Buchanan's description was written 160 years ago (1793); it remained true till recently and generally it is so still. There was thus a normal team practice for work—even a man to rest was not forgotten! As the Gaelic proverb puts it: "They won't make power (add strength) without a threesome and they'll limp without a foursome!" (*Cha deanar treine gun triuir, 's bidh iad crubach gun cheathrar*). In Gaelic, as in Scots, one speaks of a team according to its number, as "a pair, a threesome, foursome" and so on, up to a tensome (*deichnear*). In Lewis the farm-team was usually a foursome or fivesome.

Only in exceptional cases was land worked and held singly—as when a smith was kept busy at his anvil in ploughing-time and harvest. Thus in 1715 one or two rural smiths had single holdings of average value or more (£1), and one artificer or tin-smith (caird) a holding of minimum value (5s.); and in the burgh all the small plots were held singly. As the women wove, at home mostly, no male rural weaver held a single plot; his weaving could be done at slack times, so long as there was light; at busy times he worked on the land with the rest of his team.

On the mainland, both Lowland and Highland, an

on the mainland, both Lowland and Highland, an outlying reclaimable patch of arable, lying near distant, little-used pasture, frequently gave a single family the chance of a living. Such a site meant solitary toil for the man and his family; but there might be advantages such as an occasional deer from the forest, or a post as hunting 'forester' such as was held by many a Gaelic hunter-bard. In the Eastern Highlands such a high-lying croft was known as *Ruigh* (anglicised to Ry-). Traditions of poverty with individuality in isolation were handed down, for example, from one of my forebears who held such a *ruigh*, Rycorrach, one of several strung out along the 1250-feet contour in a small, high valley off Strath Spey; the last of them was abandoned only recently. Such a *ruigh* may have originally been a summer shieling, only occupied when shortage of corn-land below, coupled with new possibilities of a little profit from sheep-shearing, led to settlement there.

At the fringe of the Island's deer 'forests' of North Harris and Park, stalkers are still found in lonely lodges and dwellings, individuals often of character and worth, as they need to be; and a few isolated shepherds, such as one finds on mainland sheep farms, dwell on small islets. But in the Isles, isolated, high-lying spots for single crofts are rare. And the clearest distinction must be drawn between the true solitude of a single, isolated cottage or croft and the sociability of a group of four or five, or even two or three, crofts, such as those of lobster fishers; for even a few families form the germ of a community, in work and in leisure.

The potentialities of co-operative practice were overlooked by agricultural reformers, excusably enough. For when new methods were required, run-rig kept back the pace to that of the slowest, virtually arresting reform. Soon

after 1800, John Walker wrote that run-rig, "formerly very general in Scotland, was abolished with improvements but still subsists in many parts of the North. A number of tenants of the same farm have a common pasture for their cattle, and the arable is divided among them, by ridge and ridge alternately, which each cultivates for his own behoof. This gives them all a common interest in the crop and, when there was no inclosure by dyke or hedge, might be of some advantage" in giving each person some protection "against the encroachments of his neighbour's cattle". Speaking of joint possession this time, though without reference to survivals, Walker wrote that in the Lowlands "in old times a large farm might be occupied by a number of conjoint tenants who cultivated the farm in common and divided the produce. In this way the interest of each became the interest of the whole. They were ready, and were frequently called upon, to defend the common crop and cattle against depredations. There was then a necessity for such an allotment of land, especially in the Border country and in the Highlands." The team, in other words, was a unit of defence. But "nothing like improvement can be expected from farmers placed in this situation . . . [and] no community can ever equal the carefulness and industry of an individual in the management of his affairs".[1]

So far as it goes, such an analysis is incontrovertible; for Walker was one of many contemporary observers who could contrast both the "improvement, industry and carefulness" of the best individuals under a vigorous landlord, with the sluggishness of old-fashioned ways on backward estates. The fundamental reason for sluggishness was that

[1] John Walker, *Oeconomical History* [descriptive account] *of the Hebrides*, 1808.

the cultivable land and pasture having been shared out to minimal fractions, they called for a minimum of labour by the men—though housewives and mothers had always plenty to do. The morrow's tryst for work might prove a tryst with no work done. The men might foregather on the moor to cut peats, for instance, but if one of their number was late, become so absorbed by telling stories of the Fenians that, ere work had begun, it was time to go home—resolved to meet for work some other day! As a result, reformers advocated breaking-up the joint-holdings; and this was done in Lewis by 1830, as noted in the Brand Report. But mere division of the land did not increase its total amount.

Yet while noting the progress made by the liberation of individual initiative, we can see the drawbacks of individualism: the evictions made with no provision for new homes, and later the monotony and the loneliness of modern farm life, the mutual distrust of employer and employee, and the general inability of farmers, as yet, to co-operate. At the present, when planning, purchase and sale are required on a large scale, particularly among smallholders, the interest of each is still "the interest of the whole". The team-spirit must be recovered from the work (not simply the play) of school onwards to further education and communal effort.

To sum up, every farm-hamlet was held jointly and on equal terms, each joint holder being responsible for an equal share of the rent, and the movable run-rig system ensuring equal quality, as well as equal quantity, of land. Common interest was assured, and there was mutual support in distress or sickness, as when one member, named in a deposition of 1718, was 'valetudinary'. Lastly, work was done in common not only when it led to efficiency

through division of labour or united effort, but simply for the sake of mutual stimulus and pleasure!

(D) THE SHARING OF MACHAR, MOOR AND SEA

Embracing several joint-farms, each with its team or crew, came the township. The township had not only its common pasture, it had a special extensive system of run-rig on sandy, coastal machars, as in parts of the Island and in Uist—a system continued to this day.

On the machar of Barvas, cultivation strips are still re-allotted periodically, as they were annually on all the Island machars. The machars behind the 'storm-beach' dunes of the Outer Hebrides closely resemble one another, from the Butt of Lewis to Barra Head. The immemorial system was noted by Walker and more fully by Carmichael, who called it 'intermediate run-rig' to distinguish it from the run-rig of older joint farms on boulder clay, and it persists at the present day.[1] In North Uist the machar land is laid off in large scatts or fields. Each scatt is divided into as many rigs as there are crofts in the township. There may be a dozen scatts in all, and usually half the number are lying out in natural pasture, but they are put under crop in rotation, so that each year one or two scatts will be brought into cultivation, and the others left out after a course of cropping. When a scatt is to be brought into cultivation the township 'constable' (who holds sway under the district ground officer) appoints a day for allocating the rigs.

[1] Walker (1808); Alexander Carmichael, appendix xlviii and xcix, pp. 213 ff. and 451 ff., Report of the Crofters' Commission, 1884. Socially these form the most significant evidence in this great Report. See also "Grazing and Agrestic Customs", *Celtic Review*, 1905. Cf. C. Macdonald, *Scot. J. Agric.*, 1919. See also his lively accounts of machar and pasture: *Highland Journey: Suil air ais*, 1943.

reach their shielings. From Point district (Eye Peninsula) the cattle are still brought inland to the moors south-west of Stornoway. And from Bernera on the west the cattle are swum to the hills of the main island, just as they once were swum from Bute to the hill-pastures of Cowal in Argyllshire across the Kyle at the 'Strait of the Swimming', Colintraive (Caol-an-t-snaimh). Nothing could be more natural, indeed inevitable, than pasture in common where large, open moors were to be found. The number of animals allowed to each holding was duly apportioned and then, as now, was known as the summing or 'souming', still checked at the annual gathering (*cosgoradh*).

Thus a cluster of conjoint farms shared "the grass on the Ben and the tillage on the machar" (*Fiar air beinn agus peighinn air machair*). Along the shore, sea-ware, driftwood and the like were allotted, too. And, as Carmichael put it, there was even "run-rig at sea", for the fishing banks were allotted among the available crews. Most of these rights are still shared by the members of a township. But any crew can now fish freely where they choose, and no township can legally keep away strange boats, nor even steamers beyond the three-mile limit. This loss of communal rights stands in the way of remunerative fish-farming and its promise.

Profound social implications distinguished these three concentric circles of community: the family; the farm-team and boat's crew; and the larger, township group. These implications concerned labour, duty and right. The labour of reclamation gave a 'right' to the land thus won from the moor; and the duty of labour together, for fruits equally shared, gave the farm-team and fishing crew cohesion on land or sea—team and crew working for a common purpose. On the other hand, as individual sharers in the common

pastures of machar and moor, each man had not so much a 'common interest' or duty as, individually, a 'like interest' or right. As now, each unit, whether team or individual, would tend to desire a maximum stock for itself, perhaps hoping it would have "the luck to rear" a little more than its apportioned souming, at the risk of the over-stocking which results in common loss. But though need, greed or rivalry offered temptations, morality invited careful sharing and was enforced by common interest. The chief distinction between team and township was that the tasks of the farm-team were constructive and, like that of the boat's crew, active and co-operative. It is true that in the township certain tasks were co-operative, such as the wolf scaring of old times or the fox 'hunting' or shooting on mainland moors today. The modern gathering of sheep is also done together. But no constructive effort was involved in the allotment of shares on the machar or of stock on the moor, which were—and remain—matters merely for communal control, not communal effort.

Now, the quality of a group alters with its quantity. The intimate cohesion of a very small group of no more than half a dozen members, diminishes with an increase in number; but increase brings a compensating gain in diversity. Ten or a dozen people tend to break up into sub-groups, whether for small jobs or to enjoy conversation. The smallness of a group limits the number of relationships; an increase in number multiplies sub-groups, and life is enriched. After living long with fewer than half a dozen acquaintances, the same subjects keep cropping up in talk, the same tales are re-told, too often, and people cannot get away from one another's idiosyncrasies! A very small addition turns the scale by renewing variety. Here lay the social value of a township and neighbourhood,

embracing several hamlets. Yet the strength of community life sprang from co-operation in the farm-team and in the boat's crew.

With the passing of the joint farm the greatest disciplinary factor for work in common passed away from agriculture. The fact that fishing still remained as a social discipline, and actually developed in importance as the farm-team declined and was abolished, was to prove all the more significant to the vitality of social life until 1914 and even to the present.

(E) THE COMMUNITY ORGANISED: STEERSMAN AND CONSTABLE

As small groups of two to half a dozen men could manage their agricultural affairs informally, by common consent, no official was formally chosen to manage the affairs of the fellow-workers on a farm. Where prompt decisions are needed, however, even a small group should be led: a boat's crew therefore choose their helmsman-skipper and obey him at sea. And where several farm-groups made up a township, more formal deliberations were required, and to carry out their decisions they chose a responsible man, the constable.

Of the crofters' manner of deciding communal affairs in Uist, Carmichael wrote, in 1884, that these meetings "were highly interesting, as showing the ability of the people, their logical and legal acumen, their readiness of resources and, I can happily add, their invariable courtesy towards one another. There was one regular official known as the constable on whom there lay the chief executive responsibility. When a crofter is elected constable of his town-land, he takes off his shoes and stockings and, taking

602 576 585 764 people will be doing the same. If they think they're close enough to be invited, they'll be annoyed if you don't include them." At funerals, relatives of the deceased to about third cousins were expected to participate.

621 602 476 571 When a population has lived in a small area for generations, a dense network of kinship develops. This fact, and the importance placed on mutual aid among fellow villagers, fostered the feeling that the network of township members, who ploughed, fished and tended cattle and sheep together, was also a network of kinsmen. "We're all the same people." "It's all one family here." Occupational and kinship spheres of social activity commingled. The importance of neighbors in contrast [539] with relatives was reflected in such proverbs as, "A neighbor close at hand is better than a relative in a distant land."

621 594 [178] [571] The nuclear family did not, according to Cohen's criteria, constitute a firmly bounded system. Then as now, women preferred the company of their "own kind," that is, the company of other women. The men worked and spent periods of recreation with other men. Children 621 596 spent about as much time in the homes of grandparents, uncles or fellow villagers as they did in their own homes. A 60-year-old woman remembers that it was a

621 571 476 A 60-year-old woman remembers that it was a common practice, when she was young, for children from large families to live for as long as six weeks with other families who were relatively better off. They would help harvest the hay or the potatoes or bring in the peat in return for food, lodging and perhaps some clothing. "They usually ate better than they did at home." The children were not necessarily relatives of the families with whom they boarded.

621 572 Strong friendship, that is, the kind of friendship associated with mobile urban life in which persons confide in each other and share secrets and build up an individual relationship based on extensive knowledge [602] of one another, was nonexistent. A "friend" was a relative, or someone who gave aid when it was needed.

621 178 572 181 [602] Today it is sometimes said, "It used to be that your relatives were your best friends; now your best friends are better than your relatives." An old man will meet another on the road and say, "I used to see more of you when you needed me." Neighbors used to [231] share sheep that were killed; now households kill and [251] consume their own sheep, and freeze the meat which they cannot use immediately. Groups that walked out together [464] to the peat to finish the job in a single day are being replaced by individual family units that can motor out and do the job in stages. People prefer to give money

181 621 178 437 829 572 621 [369] [521] [476] People prefer to give money in exchange for car rides or other help, including peat-cutting, because "than you're independent." Friendships are still weak, relative to friendships in urban settings. Most information which is shared between individuals rapidly enters the pool of communal gossip. Although many persons emphasize the importance of mutual aid in defining a friend, some emphasize the ability to confide and keep secrets.

621 178 602 [585] [576] Today many of the younger villagers do not know their relatives to the extent that their elders did. In one family, a girl who was about to get married had to ask her brother, who was the only one of the siblings interested in kinship connections, whom to invite to the wedding. It is still useful to retain an inventory of

602 484 one's relatives. "I have cousins in Glasgow and Australia that I've never seen, but if I ever go there [178] I'll have a place to stay." With the increase in transportation and income, more islanders are taking brief trips away from the island. During these trips, they almost always stay with relatives.

857 577 829 178 It is frequently said that children are now "cheekier," less inclined to run errands and obey orders meekly, and that they prefer to watch television or read books by themselves to playing with each other.

child may come to spend nights or longer periods of time with them.

To some extent villagers are still dependent on each other for various kinds of help. It is considered extremely bad manners to refuse labor, a tool, or food to anyone who requests them. If someone refuses to aid another, people say, "What will he do when he needs help?" This attitude has made the island a paradise for the few salesmen who, in the last few prosperous years, have started to visit its communities; villagers find it difficult to say no to anyone who comes to their door with a request, including the request that they buy something.

A woman in childbirth was formerly attended by a local midwife, and kept in bed for two or three weeks. "Other women, both relatives and friends, came and stayed with them at night, fixing them warm tea and milk, whispering bhronag bochd (poor soul), how awful you look..." Just as today the neighbors gather at times of illness and death. It is more difficult for neighbors to come to the bedsides of young mothers of today, who are all taken to the hospital in Stornoway to have their babies; but the neighbors manage to visit the hospital, which has no choice but to ignore its rule of only two visitors per bed at a time.

The first thing that is said when for some reason a woman is left alone in the house is, "Who's going to go and sleep with her?" Often a child will be sent from a neighboring family, not always relatives, to stay with her at night. As in the past, it is not uncommon for a childless elderly couple or single person alone on a croft to take in a young, homeless couple, to whom they may or may not be related. The young couple cares for the old person or persons, and inherits the croft when they die.

"Keeping up the relation" is the process by which relatives sustain interaction and expectations of mutual aid even though their relatedness becomes more distant with succeeding generations. "I've got cousins in Ness that I stay with at the Communions. They're getting on into the third generation now." A cousin is a cousin even to the 42nd degree (Williams 1963: 142), as long as there is reason to sustain the relationship. "I know we're related, but I can't quite place it." "We're a bit related. I think she was a MacPhail before she married." "I don't quite know how we're related, but my mother and his mother considered it a close relationship, and he has kept it up."

Every villager has a vast amount of information about other villagers and their families, which may be

The Harris Tweed industry is lauded as an industry which is compatible with crofting. Because weavers are self-employed, they can set their own schedule of work and thus continue to participate in croft work and fulfill various township obligations. The effects of this industry on the township as a social boundary system were investigated. The income available from weaving is unpredictable, which encourages the retention of crofting practices and other patterns of behavior, such as "occupational pluralism," that were found to be adaptive in the past. Such strategies also strengthen township boundaries; for example, they encourage mutual aid and communal township practices. But weaving also offers a high level of income; and some weavers, preferring to spend most of their time weaving, have neglected crofting, or have invested in tractors or other motorized transport which enables them to harvest crops, cut peat and perform other activities independent of other township members.

The fundamentalist Free Church constitutes an important boundary-maintaining mechanism, serving to exclude various external influences of the larger society from the township. However, a smaller network of persons engaged in the religious sphere of social activity, a subsystem within the township system, also exists which has the appearance of a firmly bounded system. These are members of the clique

THE CROFTING TOWNSHIP

The crofting township is not quite akin to the English or Lowland village. Primarily it is a collection of dwellings of families who, as social units, gain their subsistence from the land surrounding the houses. The smallest number for a township is four family units. A functional unit of four men was the minimum necessary for a boat crew, or for the teamwork necessary to cultivate land; co-operation was essential if all four families were to survive. And from this grew the same spirit of communal work which in Lewis is seen at its best in the efforts to reclaim peat bog and turn it into fertile grassland.

Hebridean townships come close to being the nearest approach to a classless society. The shape of a township is largely dictated by the nature of the surrounding land. The shape of most of those in Harris and in Lewis is either scattered or linear (houses disposed in line at varying distances from each other), with little natural cover, either plantation or scrub. Often the main road runs through the township; some have begun to develop lateral roads, to give, from the air, the appearance of planning on a grid system. Where gardens are cultivated, the produce tends to be a summer vegetable supply for the household, little if any finding its way to Stornoway shops for sale. Peat is the usual fuel, though in townships near to the centres of Tarbert and Stornoway coal is burned; the cost of freight, however, makes it expensive.

Most of the townships are owned by commercial companies; individual lairds own some five dozen; the remainder belong to public bodies and trusts. The actual distribution of ownership of land on the island is as follows. Harris is virtually owned by individual lairds; a small percentage is owned by commercial companies. The Lochs region of Lewis has a mixed ownership: commercial companies, lairds, and public trust, the former being the largest. Stornoway parish is wholly owned by public trust. The Ness district is virtually the property of commercial companies; a small fraction belongs to public trust. The Uig district is the same, the smaller proportion, less than 10 per cent, being the concern of an individual laird.

In Lewis, the public body mentioned is the Stornoway Trust,

121 From prehistory to the present day, these geographic
178 zones have played their parts as factors in evolution,
174 although the border-lines have changed at different historic
182 crises, and have been modified by economic and social
184 phase. At times the Hebrides have been more closely linked to Ulster or to Norway than to Central Scotland. In viewing these zones, we shall not find simultaneity in historic events, but comparability in stage and transition, even at differing periods. From the evolutionary point of view, the revealing character of Island life lies not only in static survivals, in what Sir Arthur Mitchell found in the Isles and vividly described as " the Past in the Present ". Island life is characterised still more by the dynamic strength of its continuity—notably of early or primitive Christianity—and also by the late occurrence of changes when, at last, they came.

18 The social consequences of these regional differences
62 in evolution are profound. In the ' Plain ', to the south-
174 east of the Severn-Tees line, large village communities
[423] with ' common fields ' prevailed, forming the later manor villages. To the north and west, the more varied, hillier
[192] lands encouraged the continuance of hamlets. These hamlets housed close-knit groups of families, often of no more than four or five to a dozen relations or ' friends '—
—in Scots even today (much as in Gaelic) the word ' friend ' frequently implies kinship. Each small group
[462] formed a team. Together the men ploughed their mingled
• [476] rigs (or ridges) and herded their stock in common, and on the coast they rowed their boat as its crew. The
[241] women, too, did much together, as when they spun their
[286] yarn, and fulled or ' waulked ' the cloth that one of them
[423] had woven, helping by turn in childbirth and child-care. Usually several of these teams were linked in a larger

rent-rolls record something of more vital and enduring concern, the unit of community life in the Lews. This was the 'conjoint' or 'group' farm of the labouring peasantry —though it was overlaid in parts of the Island by the formation of tacks held by gentleman rent-farmers.

Both rolls are Judicial Rentals, that is to say, the tenants, great and small, were convened by the Government Commissioners and examined on oath as to the rents they formerly paid; the accounts were then entered and totalled. Because of the Jacobite resistance, the small amounts of rent and the maladministration of the Forfeited Estates, doubt was cast upon the first rental, of 1718. A second rental was therefore compiled in 1726, upon a different system, which confirms the correctness of the first.[1] All were named, including those absent or 'valetudinary'.

Owing to the Island's comparatively smooth land surface and access to the sea, the people could group themselves as they chose. Whereas in the Highland mainland many a pocket of land is too small to keep more than two or three families alive and no fishing grounds are available, in Lewis the people could join together in teams of four, five or six, to work a hamlet-farm or penny-land, definable as a joint-farm of unit size, and to man a boat with "four to row and one to steer".

The first point of interest is the equality of the shares, each man paying exactly the same as his fellow-tenants for his 'farthing',—a fourth, or other equal share of the farm. An average share of rent was a little over 10 shillings sterling with additional payments in farm produce, though not (as

[1] A. Geddes, "Conjoint Tenants", etc., *Econ. Hist. Rev.*, Second Series, vol. i, no. 1, 1948, pp. 54-60. This reconciles the evidence of 1718, reproduced in the Brand Report (1902), Appx. O, and that of 1726, edited by J. R. N. Macphail (1916).

pastoral group, the germ (in the Hebrides) of the present township with its common grazing. Hamlets and township formed circles of cultural and religious life in common. These 'sociable hamlets', or 'little commonwealths', as they were called by understanding writers on the Highlands, lived on in the Hebrides almost until a century ago. Features of their form and life have long been known, but their life has not yet been envisaged in its full dynamic significance.

The homesteads, informally grouped in these small hamlets, have been mistakenly described as solitary or 'dispersed' by scholars accustomed to larger and more compact grouping. The mistake was made by geographers of the nineteenth century, such as Meitzen with reference to the hamlets of Brittany. Similarly, because of the small number composing a typical joint team, the vital fact of team-work and joint holding has frequently been overlooked; yet a fundamental mistake is made when such close-knit team-work and joint tenure are described as 'individualistic'. Moreover, these teams were linked together in larger, more loosely bound pastoral communities of township and district. In Scotland and elsewhere, it is true, such hamlets came historically to be split up in various ways, into smaller farms and scattered cottages. The larger link of common life was also superseded by the proprietor's estate. Indeed, the twofold revolution involved caused a fundamental regional cleavage within 'the North and West'.

Partly as a result of their small size, the tenure of farm-hamlets was frequently informal. In northern England, the hamlets and their lands were not entered in Domesday Book; still less are early entries complete in Scotland. For this and other reasons, jurist and historian may fail

CHAPTER V

FAMILY, FARM GROUP AND TOWNSHIP: THE CONTINUING COMMUNITY AND ITS SOCIAL ECONOMY TO 1815

INTRODUCTION (TO CHAPTERS V AND VI)

121 593 476 632 621

THE family, the 'conjoint' or 'farm group' of four or five families, and the larger group clustered in a glen or along a shoreland, are, in ascending order, the three concentric units whose mutual relationships we must visualise to understand the past. Enduring elements of life in family and neighbourhood today, with their own special qualities and limitations, can only be understood in terms of past needs and the relationships they evoked.

121 613 621 [171]

Having seen their relationships in family, team and township, we can next turn to the reciprocal relations of the people to their chief or lord, whose position dominates European, indeed world, history and prehistory. Here our concern must be the meaning of 'clanship' to the chiefs, the joint farm-groups (or 'small tenantry') and, latterly, the tacksmen placed above them.

121 174 178 [184]

We may find, throughout this study, that features and functions which at first sight seem peculiar to the Island are really local variants, more perfectly crystallised, of forms which we know existed at earlier periods in Scotland and in much of northern and western Britain. In the Isles,

15 words are used for neighbourly help among crofters and
65 for services to the chief.[1]
14
22

Full freedom of choice in marriage prevailed among
the people, who honoured marriage and enjoined contin-
ence; but the position of the chief placed him apart from
15 the rest of the community. Now, the more equalitarian
82 the community, the more free are a couple to choose one
another on grounds of mutual affection, passion and
respect; the parents, too, are more likely to encourage or
support a suitor for their child because of character and
virility, rather than means.

15 The lads of the clan, chief and people, grew up together
65 in an isle or glen. But in manhood, while a labouring lad
82 sought a wife from the girl playmates of his childhood and
his fellow-workers at the peats, at the harvest, or in the
shielings, a chief's choice was confined to his own class.
In pre-feudal clanship, tanistry, *i.e.* the choice of a chief
among the higher kin, gave a wider choice for marriage
near home than feudal primogeniture, irrespective of the
wishes of the chief's kin except in extreme cases of unfit-
ness. In Scotland, tanistry prevailed even in the royal
line until the eleventh century. But with the dominance
of primogeniture, the young chief chose a bride outside
his own community for reasons other than those of human
feeling, honoured by Gaelic lyrical and religious tradition
and even by the Church.

As a result, the chieftain's son was granted a licence
forbidden to the rest, a temptation to maidens and a bad

[1] *Cuid* (cognate with *quota*) means a portion, lot or share, or what is one's own (*a.f., gen. cuibch*); and the associated verb (*cuidich*) means not simply
2 to share but actively to help. The apportioned lodging given to the chief
16 and his 'tail' of 'lads' was the 'cuideachy'—*cuid-oidhche*; while the
famous motto of the Seaforth Highlanders is Help the King!—*Cuidich an Righ!*

175 co-operate in active endeavour. It was all the more
632 important to have an elected 'official', the Constable,
427 one of themselves but placed in authority. There could
be no restitution of the old joint farms where they had
[241] been broken down by migration. Yet it should have been
[624] still possible to extend the old spirit to the larger townships,
as the Commissioners held.

175 Again, the constitution of the township is bound up
632 with the rights of common pasture upon the moor all the
423 year, and in winter even on unfenced arable; but the
671 Crofters' Act failed to regulate the rights and obligations
of Common Grazings. It slackened the authority of the
estate without restoring the hold of the tenant community
upon its members. After five years the Government began
to recognise the mistake, and passed the first Crofters'
Common Grazings Regulation Act, permitting the crofters
to elect a Common Grazings Committee. But it was ill-
considered; most of all because non-crofters, that is,
cottars and squatters without legal tenure, were not bound
by the Regulations. On one hand they could not get per-
mission to 'resume' (or enclose) a portion of the outrun,
in order to reclaim it as a croft, without first obtaining the
unanimous consent of the township's crofters; and in large
[233] townships there might always be an objector. Yet each
cottar could, and did, put on stock, a cow or two and a
few sheep, so nullifying the possibility of discipline.

In 1908 a second Act was passed; but twenty years
had allowed tradition to lapse and difficulties to accumu-
late. In Isle Scalpay (Tarbert) for instance, by 1909 there
were only forty legitimate crofters, but eighty cottars; and
the legal crofters would not take part in depriving any
• [476] cottar of such grazing liberties as he exercised. All were
[462] neighbours and most were relations, and their principle

175 was to share; the children needed milk and the women
632 wool to work, while the men fished. As the Crofters'
423 Commission put it at the time, "Necessity has no law and
. . . it is scarcely possible to carry out . . . the Grazings
671 Acts in this island". The position remains little changed.
• [476] Still, in spite of sixty years' delay, and the law's failure to
[462] restore an executive, the Constable, to perform specified
duties as a member of the community, the Grazings Com-
mittees do perform useful functions with credit. They
form nuclei with which proprietor, Government or co-
operative agency actually deal, and the voluntary Clerk
may shoulder considerable responsibility.

175 With regard to small occupiers paying less than £6
423 rent per annum and holding less than 10 acres and 250
671 acres of souming (or share of pasture), the Napier Com-
mission declined to recommend the bestowal of rights or
immunities tending "to fix them in a condition from which
they ought to be resolutely though gently withdrawn".
The Act, however, did grant small occupiers immunity
from eviction, and made it hard for either landlord, State
or fellow-crofters even to refuse house sites or fresh hold-
ings, particularly in the crowded Lews. The squatter
continues; indeed he is favoured, by escaping the payment
of rent and rates though he shares in benefits. The rate-
payers are proportionately, and unjustly, handicapped.
But as isolation has diminished, landless squatters have
been allowed to 'resume' portions of the common grazing
for new holdings, as by common consent at Ness and in
Lochs, after Lord Leverhulme's death.

175 A further recommendation of the Napier Commission
168 was to aid emigration. Now Sir James Matheson's aid in
167 1863 proved successful, but his later efforts met with no
response. There were then, and still may be, in the Island

427 croft by subdivision, he would pay little, indirectly and by
656 arrangement; while if he simply built a hut or house on
a vacant spot he paid neither rates nor rent. Either course
was illegal; yet it was too expensive for the landlord,
however 'hard-hearted', to take legal proceedings to turn
off a squatter. As for wholesale expropriation the suffering
caused and the odium incurred would have involved—and
would still involve—both landlord and State in insurmount-
able difficulties by starting fresh agitation, perhaps with
outbreaks of law-breaking, repression and bad blood. Yet
these anomalies still discourage, and the normal illegalities
demoralise, all concerned.

656 Because of the provision by State and local authorities
178 of a growing range of services in other regions, and also
511 because of the special reasons of Insular poverty, State
action was increasingly taken in the Isles. To what extent
12 have the Islanders responded, it may be asked; or how
far may they have failed, in return for aid offered and
• [476] benefits received? Let us begin with mutual aid practised
among the people up to 1900, and then consider the repay-
ment of loans and grants under different conditions. Ob-
servations by those in touch with the Island for many
years, officially or privately, allow one to read between the
lines and attempt an impartial judgment.

175 As to the strength of independent mutual aid there
476 could be no doubt. Up to the beginning of this century,
[651] the amounts expended on parish relief were 'almost
nothing', and had shown no increase in preceding years.
General poverty, anomalies in the rating system, and the
mistakes such as the erection of poorhouses by the central
administration, diminished resources; but the people
generously gave help to their poorer neighbours in work
and gifts. Except for a year of overwhelming crisis,

175 perhaps once in a generation, the neighbours were still the
• 476 best administrators for poor relief. On the whole, this
651 remained true to 1914.

As to financial assistance from the Government, the
175 evidence seems at first bewildering in its contradictions,
651 suggesting utter inconsistency on the part of the people.
476 Thus, the record of the Lewis-and-Harris fishermen, in
repaying loans for the purchase of boats, was the most
honourable in the North-west. In 1900, of the total
capital on barely 100 loans made to them, 83 per cent had
been repaid, whereas on 150 loans elsewhere less than
60 per cent had been repaid.

Yet as to the record of Lewismen with regard to assist-
175 ance for road-making, the Brand Report was significantly
653 reticent. In 1891 a road was planned direct to Stornoway
from Loch Roag on the west coast at Carloway. This
short-cut of sixteen miles was to shorten the distance by
seven miles and so facilitate the transit of fish landed at
Carloway. Crofter labour was employed as a means of
'self-help'. The road was, mistakenly, printed as com-
plete on 'base maps' and other recent 'quarter-inch'
maps. By 1901, £15,500 had been spent, a sum which
exceeded the estimated cost, but only eight miles of road
had been completed and five miles partially made, while
three miles were quite incomplete. The estimate having
been exceeded and "financial difficulties having arisen"—
the contractor had gone bankrupt and the engineer was
dismissed—the work came to a standstill, £10,000 more
having been estimated as necessary to complete the road.
[18] Of that sum £8000 was granted.[1] But the road was left
[46] unfinished. These figures alone might not condemn

[1] J. P. Day (1918), p. 328. Day added that "the work should now, more than twenty years after its start, be approaching completion"!

185 construction of the Island must rest upon the improvement
311 of the land": and secondly, that by this means "it was
114 imperative to revive the traditional community spirit, the
essential feature of Hebridean civilisation". Those words
still hold good. Yet the land itself is too barren and the
soil too poor to provide a living for many by export of
[438] fresh agricultural produce to the mainland. Only a local
market could pay a fair price for most of the products of
159 intensive small-holding. Judging from the free, untram-
433 melled trade before 1914, Leverhulme held that fishing
could be set upon a commercial basis in the Isles; and
228 there could be few better judges of commercial possibilities
438 than this keen industrial thinker and organiser. If he was
right, as surely he was, to begin with, then the local market
to be created, or rather enlarged by growth of population
and prosperity at Stornoway, could have purchased the
fresh milk and eggs, the fresh greens and fruit, raised on
enlarged small-holdings and marketed co-operatively.

181 A final comment remains to be made. The community
• 476 spirit of Scots fishers from Berwickshire to Barra has gone
far to make co-operation among the men of the crews a
living thing. 'Work for Wages' offered little outlet for
this, indeed it virtually suppressed it; and 'co-partner-
ship' on the Port Sunlight model was a very different
matter from the co-partnership of a crew. Even if at that
time it had been proved impossible to organise free co-
operation in fishing, co-operation in small-holding town-
ships might have kept the communal spirit alive, for later
renewal at sea.

114 It is not easy to assess the after-effects of Leverhulme's
433 activity. Leverhulme certainly helped hundreds of families
by the provision of wages for the building or rebuilding
of roads and other works, of which some were completed

311 illustrates the narrow margin of habitability on these frag-
241 mented holdings.
423 Now, in Lewis periodic pooling and exchange, or the
practice of *movable* run-rig on the small joint-tenants'
241 farms, was abolished early in the nineteenth century, except
423 upon the machar, where it still continues. Apparently the
• 476 strips were simply fixed where they had last been appor-
198 tioned by lot. Subdivision of the little crofts among sons
[175] and grandsons followed, owing to inheritance without re-
clamation. Fairness gave 'the patchwork quilt' described;
but it was fairness pushed to the point of folly, for differ-
ences in soil from one adjacent strip to another were slight!
It is otherwise with the long, narrow plough-strips which
run from the houses on the pure boulder clay down to the
sandy shore: run-rig, movable or fixed, is understandable
and necessary there. The case just cited shows how a
sensible communal tradition, such as that of '*movable*
run-rig' with periodic pooling, may degenerate into ab-
surdity by fixation. Happily the machar still shows the
sane maintenance of a tradition, the pooling of resources:[1]

182 In 1924–25, widespread distress in the Isles, the failure
161 of the Leverhulme endeavour, the crofters' refusal to own
their own crofts, and the emigration which followed, caused
182 many outsiders to forecast rapid depopulation. It was all
161 the more interesting to note the confidence in the Island's
471 future shown by buyers of the great estate, all of whom
knew what they were about, for they were men with
experience of the Island, of its rates and rentals and of its
people. To a wealthy man who repurchased a sporting

[113] [1] Apportionment of lands held in run-rig in the Carloway estate is described, and the principle discussed, in *Scottish Land Court Reports*. (See *Scottish Law Rev.* vol. 28, 7: July 1949, pp. 51–54.) At the same time 'mechanisation', or the co-operative utilisation of tractors had led to pleas for 'collective farming'. (*Stornoway Gazette*, February 1944.)

181 for help?" In one of the Outer Isles, I know of one or
458 two crofters holding fifteen acres of arable, with a share of
a good outrun, who have let their stock dwindle and
746 deteriorate, and their crofts lie mostly fallow, though these
could support a horse or two, several cows, and fifty sheep.
After having found some casual labour, they discovered
they could live mostly idle 'on the dole'. Self-respecting
neighbours suffer: good families who prefer to be inde-
pendent of 'Assistance' and to improve their croft
• [476] and stock, and the outrun too. These find their stock
deteriorating for lack of co-operation in breeding, fencing,
and other communal duties, and see their crops invaded
by weeds, blown from a lazy neighbour's plot. While
an idle neighbour benefits by their industry, they them-
selves are losers.

In another island, a hard-working crofter lost a score
of good lambs through 'worrying' by the dogs of an idle
neighbour, whose own stock had dwindled to a trifle. He
was finally awarded legal compensation; but he found it
wiser not to exact it, for the unspoken threat of exaction
[476] gave him a hold upon the idle 'dole-drawer'. The worker
[626] could still insist that the idler pay his share of the cost of
posts and wire for a fence on the outrun, or contribute
the minimum hours of labour due for fencing and other
[461] statutory tasks in the township. Men like that idler sap
181 the urge to work. They lower communal morality to a
semblance of the social code once too commonly seen by
Islanders in the domestic service of the upper and middle
classes, a code by which chronic idleness was disguised as
'leisure' and conspicuous dependence upon the work of
others was honoured as 'independent means'.[1]

[1] A summary of production, and figures of productive and non-productive income, are given in Appendix I.

(c) THE OUTLOOK: 1939–54 AND SINCE

458 How then can the situation be assessed, as it was before
178 the outbreak of war and since then? By 1939 twenty years
had been partly lost; for the after-war years of the 'Lever-
hulme boom' were followed by discouragement and
poverty. During that time one might have hoped for half
[423] a generation of reconstruction and progress. On the other
hand the sore question of dividing the farms was settled,
so bringing raiding to an end. Congestion on the existing
crofts is less than it was, owing to this fact, and to the
[166] provision of feus. The poverty of many breadwinners
who had migrated to the cities first cut down the amounts
remitted to their Island dependents, then drove them home.
[433] A croft, or even a garden site, and the opportunity of
building a good house there made life still worth while,
[746] when other employment had failed. Unemployment
relief, though tempting some to idleness, gave a respite
[286] which many utilised to make a fresh start. As fishing
waned, many had taken advantage of the easy beginning
[226] offered to learn a new trade—weaving. This has made
many feel that the living to be found on the Island is
better than alternation of 'wage-earning' with unemploy-
ment, in Glasgow or abroad. They believe the situation
[311] of the Island community to be hopeful. While the land
remains little better than before, many, even of the younger
people, still care for the Island life among their own kin.
Given a clear lead, these could reorganise themselves, and
undertake the developments needed in fishing, weaving
and reclamation. The homes are sound, 'good neigh-
bourhood' endures, and given fresh opportunity, the
community could awaken to new life.

178 During and since the war, co-operative marketing was
44
• 476

178 developed through the township Grazing Committees by
• 476 the Scottish Agricultural Organisation Society and its
44 associated Crofters' Agency. Lime and fertilisers were
[654] purchased, and wool and other products sold, co-oper-
atively. The co-operative marketing of lobsters, taking
[228] advantage of fluctuating London prices, has led to the
reconstruction of ponds for storage. By these and other
[654] means, government assistance is utilised but not squan-
dered; earlier initiative in agricultural organisation is
reinforced; and communal tradition is revived, linked
to personal responsibility through the crofters' lifelong
knowledge of one another.

178 As to the future, all agreed that unless the Harris Tweed
288 industry flourished, with work at reasonable wages, the
villages would be abandoned by the young, perhaps with
[829] no return such as hitherto on 'retirement'. Many young
people are content with life in the townships, provided
they can get a living there, though not all, for they are
somewhat divided; and work elsewhere, even in the mills
of Stornoway, is a counter-attraction.

178 Social life is undergoing changes which operate both
592 for and against the retention of the young. On one hand,
538 household interchange of conversation, song and story,
the *ceilidh*, has declined. On the other hand, one found
178 that, as regards religious prohibitions, and in spite of the
771 nervous tension expressed in 'Revivals', the young have
577 won greater freedom. Near one village a Nissen hut,
handed over to the Home Guard, was also used by young
[535] people for monthly dances. When I asked a young crofter
invalided from the Navy whether the Elders of the Kirk
made no protest, he replied that they had, but had to give
it up: "They see that we won't stand for it"! This
would have been unthinkable during the First World War,

Stock Management.

221 The annual rhythm of stock keeping has lost the clear definition it used to some extent
235 to possess. The decline in summer residence at shielings has already been mentioned:
178 most were in use up to 1914, and many were visited after the Great War, but the decline
continued during the inter-war period until practically the last visits were made between
1936 (Lundale) and 1939 (Tobson): very few shielings have been visited since. There
• [476] are one or two isolated examples of a summer visit to the pastures still surviving, but
they are not carried out by regular crofters having normal grazing rights. The
construction, since 1908, of ring fences around the inbye and the more recent fencing of
certain common grazings has further lessened the necessity of herding and co-operating
regularly on the commons. The importance of fencing may be judged by the fact that it
was estimated that, whereas prior to the construction of the fence there were about 4,000
sheep grazing over the Earshader - Crulivig - Lundale area, including about 2,000 from
the Bernera Shielings and about 200 from Uig, there are now only about 1,500. Figure
30 indicates both the periods when the sheep are on the hill and the variation in the
dates of movement. This applies mainly to the Island townships, for mainland townships
which are contiguous with the grazings, may keep sheep on the hill for as long as six
months each year. The rest of the year is spent on the township pasture and inbye.
Hacklete, Kirkibost and all but seven of the Tobson crofts are open in the winter to common
grazing. When the custom was more widespread the dates were clearly stated and
adhered to, now there is more variation, and November 7th or 14th (Hacklete) or 17th
(Kirkibost) have become indications rather than rules, depending on weather and the
lifting of crops. On the mainland, ('Bernera Shore') the sheep may be brought merely
nearer to the crofts rather than right onto the arable: where fences have been construc-
ted separating off an area of common grazing next the head dyke of the township, as at
Earshader (1908)*, Crulivig (1908, and 1939), and Lundale, this practice may be forma-
lised, so that only certain classes of sheep are ever taken on the croft. The movement
from the croft to the hills is governed mainly by the weather: the mild sheep will be sent
off to the hills some time in April if at all possible, and the ewes in lamb often there-
upon taken into the inbye if they are not there already. During May, when lambing is
safely accomplished, the beasts able to support themselves and when the weather is
suitable, the ewes with lambs are sent to the hill.

There are some places with special practices, notably Little Bernera which is closed
to grazing in July, August and September. Similarly each holding may graze a certain
proportion of replacement hogge upon the township common grazing of Breacleit while
the other stock is on the hill: this may formerly have been a more widespread custom:
it certainly has contemporary parallel in Kirkibost where some sheep remain on the
township common pasture to compensate for the much reduced numbers of cattle grazing
there in summer.

The individual crofter, or two or more in co-operation, keeps tups buying a new beast
from a different source every three years, unlike Sutherland where it is almost universal
to hire them. These are usually tethered upon the croft from August until tupping in
December. This again takes place on the croft (compare Sutherland, where, since the
tups are generally hired by the township, the tupping is usually done upon the hill and
often entails a good deal of herding). The ewes are not generally hand fed except in
emergency, though here, as in all other crofting areas, opinion is divided on the advisable
extent of this practice. It is however, more general to hand feed the hogge which, indeed,
may be kept under-cover at night in the worst weather, even though they are on the croft
[132] or (Bernera Shore) on the nearer common grazing during the day. It is clear, though,
that, in spite of the occasional hard weather, there is not generally the amount of snow
and frost in winter to cause that amount of hand feeding and care which is a necessity in
many parts of the mainland Highlands.

*Since 1950 about 120 acres have been divided in four and individually fenced.

hinterland with the outside world, Portree is a center for tourists during the summer. Due to the people's dependence on tourism and also the presence of newcomers, the villagers participate in a number of social activities which are not tolerated elsewhere on the island because of religious asceticism.

Glendale and Kilmuir are crofting communities, each with a population of about 300. All, except the ministers and school teachers, are dependent on the breeding of cattle and sheep and the growing of a limited amount of grain, potatoes and hay for all or a large part of their livelihood. All are bilingual, speaking Gaelic and English. Neither community has a village nucleus, but both have an economic focus. Glendale has a cooperative farm, and Kilmuir has a drained loch which has been divided among the small farmers. The significant differences between them are three. The Glendale people are land owners. In this respect they are rather unique in the Highlands. The Kilmuir residents, like most Highlanders, rent their crofts. The second difference is religious. Glendale is religiously homogeneous while Kilmuir includes church-goers of three Presbyterian sects. Finally, no formal social activities other than an annual meeting of the share-holders in the farm is allowed in Glendale, but Kilmuir has a club organization for the men who gather for lectures and discussions of economic problems.

The labor in this pastoral-agricultural economy is provided by the crofter's family, periodically aided by some or all of the families who share in the common grazing.[11] Under the direction of the father, the mother and children care for the crops and cattle. Heavy work, such as ploughing, reaping, and feeding the cattle in the winter, is left to the men. The women milk the cattle, help at the harvest by raking and stacking, and care for the garden. Although men never do any work in the house, in the absence of a son the wives and daughters are expected to fill in the gaps in man's work in addition to running the household. Inter-family cooperation centers on the handling of the sheep. Frequently, the families who share the common own the sheep collectively, as a "club stock," and share in the expenses and profits as well as the labor. The only basic pattern in the division of labor is that women never shear, and it is their responsibility to feed the group.

Formerly, the annual economic cycle was adjusted to the demands of crop cultivation and cattle breeding. Within the last hundred years, however, sheep have assumed commercial importance and now determine the seasonal tempo of labor. The old year ends and the new begins with the bringing in of the rams from the hill. In March the sheep are dipped and then the preparations are made for the lambing season, in April. From spring until autumn there is a rapid succession of duties: ploughing, planting, peat cutting, dipping and shearing the sheep, stock sales, harvesting, and similar tasks. After the

[11] Cf. Ibid., pp. 53-64, 70-74.

change in the use of the grazing land or a desire of the young men to fence the crofts in an effort to improve the individual crofts the old men must have their say. Through their position in the churches, the old men also are the paramount source of social control, preserving their traditional habits and statuses, including a severe limitation on all social activity of a frivolous nature. This religiously sanctioned control is strengthened by the inability of the youth to form a solidarity. Indeed, one of the most serious limitations of the society of Skye is the small number of young men and women, boys and girls and the few opportunities which they have to come together as a group. The functions of the old men's age grade are identical with those described for the Irish small farmer.[21] Another social circle is composed of the affiliates of the same religious sect. They are mainly a mutual aid group.

Although the status equality noted in the township for all of the same sex and age carries over to the larger community, there are always a few people who have an achieved status. The minister enjoys high social prestige as the spiritual guardian of the people. The doctor is valued for his role in caring for the people's physical well-being. The school teacher is respected because he educates the youth and often acts as a spokeman for the group. If there is a member of the landed gentry, he will be accorded the highest status in the area. It is interesting to note that the achieved status positions are most often filled by newcomers to the island. The shopkeepers and

[21] Arensberg, op. cit., pp. 125-139.

compared with 34.9 for Scotland. The death rate among Skyemen, however, was 17.4 compared with 22.0 for Scots in general. But Scotland had a net emigration rate of only 3.6 while the Skyemen were leaving at a rate of 16.5. In this decade no fewer than 3,115 left Skye.

By the end of the third period an additional influence of the process of commercialization had become apparent. The social hierarchy was modified in the direction of greater socio-economic differentiation.[68] At the time of the "Forty-five" Skye was inhabited by the families of three clan chiefs, 139 tacksmen, 517 joint-tenants, 1031 subtenants, and 444 servants. There were now 10 landlords. The tacksmen had been replaced by 29 graziers and 12 small farmers. The joint-tenants, subtenants, and servants had become 2043 crofters and 1227 cottars. In the past there may have been one innkeeper, at Portree, and a few millers; now there were 32 innkeepers, millers, and merchants.

The changes which we have been considering could not have left the patterns of interaction undisturbed. Cooperation among the members of the township would have been unnecessary. Since all were affected by prolonged destitution, mutual aid must have been severely curtailed. The extended family was broken by emigration. The nuclear family was seldom intact for more than part of the year. It seems the majority of the able-bodied men were travelling to the east coast each spring to find

[68] Lachlan MacDonald, The Past and Present Position of the Skye Crofters, pp. 4-7, 6-7, 11-12, 14-15; and J. G. MacKay, "Social Life in Skye from Legend and Story," TGSI, Vol. XXIX (1922), pp. 260-290.

amount of time which is allotted to each activity and in the pressure on the crofters to complete each chore within a relatively definite period. There are also differences in the number of non-crofting activities in which the individual can or must engage. Let us follow several crofters through the year to see what these differences are.

The Full-time Crofter. One might say the year for the full-time crofter begins during the first week of January when he goes out to the hill to bring in his rams. This is the first break in the monotony of his winter schedule, but it is only a momentary break. Not until March does his season of prolonged labor begin with the first "dipping" of the sheep to rid the animals of tick and parasites. He and his wife, their children, if they are old enough, and their neighbors or hired hands, crofters from nearby townships, join forces. Several of the men go off to the hill to gather the sheep and herd them down to the "fank," a stone or sheet iron inclosure consisting of either two or three pens, a trough for the "dip," and a shearing platform. While waiting for the sheep, the remaining men and women prepare the "fank" for the day's work. One by one the sheep move through the pens until all have been picked up bodily and submerged in the medicinal bath. The women not only help their fathers and husbands at the "fank" but also prepare a noon meal for the group.

Following the dipping, the crofter turns his attention to the soil. By late March or early April he has ploughed,

considered a busy month, June duties are even more pressing. Although the winter sales are over, the rainfall has begun to increase. A succession and variety of demands are made on the crofter's time. Once again the sheep must be brought down to the "fank." This time the purpose is to mark the lambs. The males, unless one or two healthy specimens are selected for future use as rams, are castrated and smeared with a dye to indicate their ownership. The females are smeared and have their ears cut to signify both ownership and age. Like the dipping, this operation requires the cooperation of the crofter and his family, the neighbors, and hired hands. Next the sheep without lambs are dipped once again and given a dose of medicine for liver fluke and a variety of diseases. At the same time, the early hay and, perhaps, the early potatoes are ready for harvesting. The end of June brings the Highland Wool Fair in Inverness. If he has Cheviot sheep, as most crofters do, the man must go to arrange for their wintering on the milder and drier east coast. Although Cheviots produce a finer wool than the more common Blackface sheep, they do not stand up to the incessant wind and rain of a Skye winter. If his wife can leave the children behind, she will accompany her husband. The old function of the Fair, the sale of wool, has disappeared under government price control legislation.

It is not unusual to have the early harvest delayed until July, but even then the mowing may have to wait because sheep must come first. On one of the dry days during the first

The Part-time Crofter. The part-time crofter follows much the same schedule and shares the same succession and variety of chores. Indeed, some are not so much part-time crofters as they are part-time employees. As such, they are successfully preserving a traditional economy no longer en rapport with the surrounding twentieth century commercial world by depending upon economic benefits of contractual relationships to the smallest possible degree. One fellow saw the situation this way: "We don't need factories and the like; what we need is something that will give us time to attend to our crofts." Others feel that if they have to abandon the traditional way of life, they might just as well leave the island for places where greater opportunities for social activity are joined with relative economic prosperity.

The part-time crofter has less land than the full-time crofter and less need for cultivating all of it because he has fewer cattle to feed during the winter. He, therefore, devotes less time to tilling his soil. On the other hand, although he has fewer sheep, the collective flock of his township is almost always larger than the stock of a large croft. Consequently, he spends more time dipping, marking, and shearing sheep in cooperation with his neighbors. Hired labor plays a minor role in the townships. Often the only hired hand is one of their number who assumes the responsibility of shepherding the flock. Some of the townships with club stocks, however, have adopted the practice of paying each shareholder for his labor out of the profits to encourage cooperation or to penalize those who do not do their full share.

those who do not do their full share.

The year for the part-time crofter begins with the preparation of his fields. As a general rule both the man who spends his winter working for the British Railways or away at sea, and the one who finds summer employment near home is found on his croft during this period. Following the example of the large crofter some use a tractor while others continue to plough by horse. More and more are tending to take advantage of the contracting service of the Department of Agriculture and hire a tractor and driver. Once the crops are in, the majority are free until the lambing season. Conservative in his belief that too much handling of the sheep is harmful or individually faced with the almost prohibitive task of singling a small flock out of several hundred sheep, he tends to omit the March dipping. During the lambing season, the several crofters of the township either take turns on the hill or hire a shepherd. The first chore, then, which brings them together as a group is the marking of the lambs and the first dipping of the sheep without lambs. The July shearing and the statutory dips in August and November are cooperative ventures shared by all crofters no matter what size croft they occupy.

In sundry ways, economic interests, judged in terms of commercial efficiency, play a smaller part in determining the economic cycle of the part-time crofter than in the case of the full-time crofter. The part-time crofter does not think it worthwhile to ship his few head of stock to the mainland auction markets. He sells them locally at the tri-annual sales.

division of labor. During the summer, she will milk the cows, and in the winter she will see that they are fed. If there is to be a harvest in the autumn, she will care for the crops.

Some women, in particular the older ones, plough with the caschrom, the foot plough. Other women use a small power driven plough or contract with the Department of Agriculture to have the ploughing done. The Department will also provide the men and machinery to harrow, cultivate, spread lime and manure, mow hay, cut and bind oats, dig potatoes, and thresh grain. By utilizing these services, if they can be afforded, the small crofter can free himself or, at least his wife, from many arduous tasks. The need for cooperation of the family and neighbors is thereby reduced. Although traditional mutual aid is being replaced by cash payment for labor, it is not the labor of a landless working class which commercialization often creates, but rather state provided services. Significantly, most Department employees are newcomers. The Skye man who works for the Department is a better worker away from the island. Since few are able to pay for these services, the wife digs the potatoes, and some women use the scythe to reap hay and oats. The scythe, it will be remembered is really a man's tool. Frequently, the break with tradition is avoided by the return of a son from the mainland or the sea. Running the household and working the croft is not all some women do. They also take in summer visitors, by the day or week, and provide teas for travellers.

In summary, it may be said that crofting is anything but an easy life with ample rewards. We have seen how meager the

fruits of labor are for the vast majority. Although they establish their own tempo, the crofters, both men and women, must follow the dictates of the seasons. Inclement weather imposes prolonged periods of idleness. There are conflicts. These are not conflicts of meaning, but they pose serious pro The small crofter has to decide how he can best allocate his time. He may want to get in his hay or try making silage, but his sheep, his main source of income, must come first. This does not mean that there is economic disintegration. Int gration does not mean smooth functioning. Perhaps, a further discussion of cooperation will clarify the situation.

Cooperation

Today it is commonplace to assert that the Sgiathanach, and the Highlander in general, is "independent" and "just not cooperative." Certainly they have come a long way from the days when the old four horse plough made cooperation essential and the use of the caschrom made it welcome. Population instability, subdivision of the crofts and the change from a subsistence economy to an export economy based on sheep and cattle could not have left the old pattern of mutual, reciprocal dependence undisturbed. But does this mean they no longer cooperate? I think not. In fact, I think critics of the Highland Problem have exaggerated,[9] and the people, always ready to glorify the past, have been influenced by stories of an ideal

d.

More than one crofter told me that one of the biggest
ges on Skye in the last thirty or forty years was that their
hbors are "less Christian," in the sense of being neighborly
helping each other, than they used to be. Once no one
, "I've finished my work," until everyone in the township
stacked his grain. "Colin is harvesting today and Murdo to-
ow; we'll go over and lend them a hand," was the expected
tude. Toward the end of the season, the whole township
d be seen working on an old widow's croft. "Now when a
has cleared his land, he says, 'I'm finished,' and that's
." such a statement has to be followed by asking if they
forget about the sick and the aged. The answer is always
same: "When a person needs help, his neighbors will help
Perhaps they can't do his corn, but they help by just
ing a few fish by the door or a pail of milk in his cottage."
hort, they continue to give mutual aid, but it is anonymous.
Highlander never looks for thanks and never offers it. I
mber our landlady complaining about an Eastcoaster in
ree whom she had helped by giving some outgrown children's
hes. The recipient had thanked her profusely. "You know,
," she said, "If anyone did that for me, I'd be too choked
o say anything."

Not all use the same colors to paint the scene. I was
told that the harvest was formerly a time of friendly
lry. The gobhair-bhacaig, two sheaths of oats tied at
t angles, used to be thrown on the unfinished fields within

each township as a sign of contempt.[10] This suggests that the practice of helping one's neighbors with the harvest was relatively recent. Again in the matter of cutting peats, frequently described as cooperative, and a communal undertaking as late as 20 years ago, there is disagreement. All in the township used to work together, cutting for each crofter in turn and enjoying a festive picnic. "Sure they would," others told me," but first they would cut for the minister and then for the shopkeeper." The shopkeeper was more important to them in those days because they would all be in perennial debt to him, and he might extend a little more credit if they were in his good graces. They would then cut for each other. By the time they got around to the old widow with no one to cut for her, they were all too busy. The sheep had to be dipped or the fields needed attention. I have heard conflicting versions of these stories from neighbors. Are we to conclude that cooperation varied from door to door and township to township?

The growth in importance of sheep as a major source of income, associated with the decline of the old subsistence economy, led to new patterns of cooperation. To be economic sheep must be raised in numbers. As we have seen, physical cooperation is imperative, and many crofters cooperate financially, pooling their capital and dividing the profits. This is true of the nine townships of Kilmuir. Moreover, even in townships where the crofters have rejected the club stock plan the individual flocks are generally handled as club stock.

[10] Cf. William MacKenzie, Skye: Iochdar-Trotternish, p.59.

In Claigan, for example, the crofters felt they would do better with private flocks than with a club stock. Although each man now has his own sheep on the township grazing, they are cared for like any club stock. The four crofters are needed for success at the dippings, marking, and shearing, and they are always at the fank on these occasions. In larger townships, those with ten or more holdings, the need for all the crofters to help out at the fank is less pressing while the felt need for auxiliary employment is stronger. In consequence, the cooperative work habits run less smoothly. In an attempt at adjustment, many townships have resorted to paying the share holders for their labor from the profits. To the best of my knowledge, only one township has witnessed the total suppression of the cooperative spirit; all the crofters are too busy with full-time employment to bother with the steadily declining sheep stock.

Nevertheless, it has become commonplace for the crofters to complain of at least one individual in the township who does not pull his full share, someone who is "trying to sabotage the whole thing."

Independence is a personality trait, but it is best described as a steadfast determination not to conform for the mere sake of conformity when an innovation handed down from the outside commercial world is at stake. The old ways are the best ways, even if only the old men think so. It is the old men who uphold the traditional practices. As long as they do, and as long as unanimous consent is required for any change,

157 476 829 808 the Highlander will be "independent." As for being "just not cooperative," what the critic really means is that the crofter is unable to cooperate in the ways city people or more sophisticated farmers do. The cooperative movement has come to Skye, but it was not a local venture. The Scottish Cooperative and Wholesale Society opened its shops, without shareholders. The distinction between the crofters' simple cooperation and sophisticated cooperation, including capital investment, does not invariably hold.[11] There are sheep stock clubs. Government loans, of course, provided the initial capital.

476 621 632 In dealing with the topic of cooperation, as any part of the economic aspect of the culture of the Sgiathanach, the basic importance of the township again and again emerges. Only a few crofts exist apart from a township. A more detailed analysis of the township system and the pressures it imposes on the crofter is, therefore, in order.

The Township

621 632 The efficient unit in the local economy is the township, the modern equivalent of the joint-tenants' and tacksmen's farms. Each township consists of a variable number of individual holdings, the low-lying arable and improved grass land held under hereditary tenure, and a more or less extensive area of rough, unimproved hill grazing held in common. The common, concurrent right of each crofter to use the hill grazing under the "souming" principle gives the township its focus.

[11] Cf. Darling and Morley, loc. cit.

361 632 162 The number of holdings which can be carved from the land in any one place and the proximity of these clusters of crofts to each other are determined to a large degree by the limiting influences of the environment. Landforms, climate, and soil have always restricted settlement to the coastal fringe and a few internal glens. Although the Sgiathanach has abandoned his former dependence on a subsistence economy, the original cultural adjustment, these natural features continue to exert a negative influence. Each man must have some arable land to provide winter feed for his cattle and to winter his sheep.

If the low-lying area is small and isolated, only a few holdings can be laid out. If the fertile area is large, the influence of the environment is less direct. In either case social and economic factors are important. The small isolated townships are invariably unsuccessful. A few, like Point of Sleat, are completely empty. Others are all but derelict. There is Kylerhea in Sleat where no children have been born in over fifteen years. Suisinish in Strath, a township well remembered from the days of the "Clearances," when a minister's sheep replaced the inhabitants, is now inhabited by an old man and his two elderly bachelor sons. All of these 476 231 162 failing townships are at the end of a road. Whereas the minimum size was once four able-bodied men, the number in a plough team or a boat crew,[12] it is now three. This functional trio is indispensible for the care of a sheep stock large enough to be worth keeping. Even three families do seem to satisfy the social minimum.

[12] Ibid., pp. 1-2.

632 621 233 476 162 The maximum is harder to determine, economically. There is some limit to the number who can stock a common grazing with individually owned stock without becoming involved in complicated entanglements over right, obligations, and questions of ownership. The few townships containing more than thirty crofts in the Western Highlands (91 out of 957),[13] and the negligible number on Skye (only ten), suggests that less than thirty holdings per township, no matter how much fertile land surrounds the cluster, has been found to be the optimum. Most of the townships contain between five and twenty crofts. The fact that many large, adjacent townships, such as Bornesketaig in Kilmuir and all those in the Braes, are losing their population is a reflection of a many faceted condition we have been exploring throughout this chapter--the vast majority of the crofts are too small to provide an adequate livelihood. One of the primary causes for this state of affairs would seem to be overcrowding on the land.

162 632 621 427 291 Congestion. In almost all but the recently established or replanned townships, congestion is a legacy of the increase in population during the first century of the modern period, often aggravated by coerced subdivision during the period of the "Clearances." Because of this, over-all statistics have little meaning. It is quite correct to say there are some 2300 crofts on Skye and approximately 2200 crofters, but this does not mean each family has a croft to itself. To take

[13] Ibid., table 1.

[Caversta]

Each croft is fenced but has a gate giving access to the common grazing, in which each crofter holds an equal share. The township has no specially enclosed area for fanking or other purposes and no fixed date exists on which the crofters open their gates for winter grazing. Breeding ewes are normally brought in for tupping in mid-October and November when crops have been gathered, and lambing takes place in late March or April. After dipping and inoculation with vaccines for black leg, braxy and louping ill, the sheep are put out on the common grazing in the second or third week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep soum, but the overall stocking is only 88 per cent of the total souming. Two crofts only exceed their individual soums, while the others are well below the number required for greatest efficiency. The grazing is, however, poor for summer pasture, owing to the lack of grass, but the heather is valuable for wintering the hoggs. Lewis Blackface sheep are the predominant breed and the wool, clipped in July, is sold to the Stornoway mills and the animals themselves are sent to the slaughter house. The 1958 loss at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the ewes. More than forty lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on the crofts. Calves are born throughout the summer months, but whereas early-born calves may be sold in the Autumn at six months old, those born later must be wintered to eight months until the Spring sales. The cows are served by the Department of Agriculture Highland bull at Habost, but although good prices are obtained for beef cattle, it is felt that for the family milk supply, a dairy bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. In most cases the land under each crop is less than half an acre and nowhere does it exceed two acres. The land has been built up into lazybeds about six to ten feet wide, separated by open drainage channels and worked by the spade. There are only two holdings where a tractor (hired from Habost) is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not altogether suitable for mechanisation at present, for the terrain is very uneven and broken up by marsh and steep faces of bare rock.

Neither Torista nor Caversta is on a main road. The former is served by a track joining the road near Cromore, while the latter has a secondary road running as far as the township dyke, and an inferior footpath joining the main road at Garyvard. The lack of a good road within the dyke acts as a deterrent to the use of modern equipment and fertilisers. Byre manure is used on all the crofts and seaweed is brought from the shore and spread on the lazybeds. Artificial manures, used on only three crofts, must be carried over rough ground from the dyke. This lack of incentive to improve is perhaps even more marked by the fact that on one holding alone is a rotation practised - potatoes, oats undersown with clover, then hay for three or four years. Apart from this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years. Natural grass yields the bulk of the hay and is often cut from lazybeds that were formerly cultivated. On one croft there is upwards of quarter of an acre where the old ridges can be seen to have a crescentic shape and are thought to date back more than one hundred years. A short distance beyond the township dyke is a similar stretch of land, now colonised by heather.

Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut on the common grazing, as near the road as possible in May and June, and later brought home by creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to twenty chickens; rowing boats for line fishing, solely to supplement the larders, are also maintained.

In 1841 population records show that there were twenty-two persons at Caversta and seven at Torista. After 1881, when maximum figures of fifty-nine and nineteen were noted, there was a secondary peak in 1911 in Caversta, followed by a steady drop to twenty in 1951 and eighteen in 1958.

[Marivig]

There are only fifteen cows, two yearlings and four calves in the township, and the crofters wi no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundr and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, wh all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

Peats cut on the common are transported by lorry to the crofts, while peats from the north end the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft, and with this supplements the family food supply. One herring boat, operating nightly from Storno and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two other are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobst during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the roads while several men work partly on the crofts but are periodically away whaling in South Geor fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual migration from Marivig, especially of the young people, is reflected in the high average age of the permanent residents, and in the numbers in the school -over one hundred pupils in 1900, thirty-n (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. The is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road which reached the township from the west in the late 1920's has a tarred surface and is much better than the later road southwards to Gravir which is untarred. There is no church in Marivig and most of the population attend the Free Church in Gravir.

Within the township the two arms of the township road serve all but two of the crofts and the sites of the newer houses, few of them more than thirty years old, tend to be near the road, while the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remai and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron All the crofts are supplied with electricity from the grid, but very few have a piped water supply; rainwater is collected from the roofs and piped for washing, with a separate piped supply from well for drinking. All other houses draw water from wells.

The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for th drift of population away from the crofts, but those who remain have little incentive to work the crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring pros perity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

*175 squatters without any legal hold on the land. In Duirinish
*178 parish, which includes Glendale, only twenty-one families had
427 enough land to meet even subsistence needs.[62] In one Glendale
233 township, Holmisdale, some crofts of four acres had as
166 many as fifteen people to support.[63] Part of this extreme
167 congestion was due to the continued practice of subdividing
425 one's croft when a child married. Although the population
162 in 1831 had fallen to 17,680, from 23,084 in 1841, almost
[161] every township had two or three times the number of families which had lived in them in 1841.[64]

*175 The loss of the summer shielings and the common grazings
*178 meant few could keep sheep.[65] The looms were silent. Since
427 the rent continued to be based on the value of livestock
233 and was wholly or partially paid from the sale of cattle, all
241 oats, which the graziers' sheep did not eat, went to feed the
[439] cattle. The mills were all but idle. The people had to buy
[242] flour, meal, and bread imported from Glasgow. Almost all
[452] were heavily in debt to the local merchants, who seem to have been newcomers with more associations with the graziers than
[272] the crofters and cottars. Milk became a precious commodity.
[482] Frequently, the old cow had only enough for her calf. Unable
[462] to keep horses, the women became beasts of burden. They carried

item. No fish without scales is eaten by the Skyeman.

The crofters use small boats, under thirty feet keel, and work in pairs. By contributing creels and sharing the risks as well as the profits, the cost of equipment for each individual is modest. Here, of course, is an additional form of cooperation which has not disappeared. The techniques have remained conservative. The use of small boats restricts operations to sheltered areas, and conservation is not an important consideration.[30] One order, for example, issued by the government prohibited the sale of berried lobsters (females with eggs) without success. The eggs are simply scrubbed off. The law will be useless as long as there are men among them who continue to believe that: "In the old days we took berried lobsters, and the lobsters thrived." Another order has made it illegal to take lobsters under nine inches, the favorite size in the London and Paris markets. This has not only spoiled the market but also is difficult on the crofters because they use small creels. Still, the real trouble is said to be the lack of a closed season. Bretons come over and work the waters during the summer when the Sgiathanach is busy on the land. Crofters from southern Skye are accused of poaching the northern lochs. This leaves few lobsters for the local residents who only go after lobster between November and March.

Although international considerations do not pertain to the question of a closed season, the British government considers

[30] Cf. Darling and Morley, op. cit., pp. 44-45.

dà peathar, and iar-oghaichean na peathar 's a' thràthar.

Within the group which the Sgiathanach calls his "family," we find that husband is fear, and wife is bean. Their children are mac and nighean. Marriage, of course, extends the circle of relatives. Both members of the married pair refer to their spouse's "people" as athair-céile for father-in-law, màthair-céile for mother-in-law, bràthair-céile for brother-in-law, and piuthar-céile for sister-in-law. Céile means mate's, in these cases. This leaves us with two classificatory terms which ignore sex. A grandchild is ogha, and a son-in-law or daughter-in-law is cliamhain.[21]

Although this nomenclature is correlated with expected patterns of ideal behavior, in reality, as I have said, the system has broken down under the impact of economic forces. With neo-local residence the township has come to be occupied by what the Sgiathanach calls "friends" rather than "people." Not uncommonly, brothers and sisters take up residence after marriage not only in different townships but also in distant neighborhoods. The sharing of work, then, mainly involves cousins. Unlike Ireland,[22] there is no strong taboo against marrying a cousin. Cousins marry "to keep the money in the family," and remote cousins were apparently preferred

[21] Although Arensberg and Kimball look upon the Irish System as essentially similar to that of northern and western Europe and the United States, excepting minor variations (op. cit., p.97), I was struck by the dissimilarity of the kinship system of the Sgiathanach to that of the United States. The underlying principles are, of course, the same, but the ramifications set the two apart; see, e.g., Talcott Parsons, "The Kinship System of the Contemporary United States," American Anthropologist, Vol. XLV, No. 1 (Mar., 1943), pp.22-38; and David M. Schneider and George C. Homans, "Kinship Terminology and the American Kinship System," American Anthropologist, Vol. LVII, No. 6 (Dec., 1955), pp. 1194-1208.

[22] Arensberg and Kimball, op. cit., pp. 83-86.

by a second cousin. The striking thing to realize here is that the nearest surviving relative always knows his obligation and is ready to fulfill it, without question. Fatherless children are buried by either their paternal or maternal uncle. I have not forgotten the existence of women. The simple fact is, women play no part as mourners. Indeed, the rare woman who goes to the grave becomes the subject of lasting gossip.

Fundamentally, the system of kinship is patrilineal. Linguistically, the terms for relatives may be bilateral, and inheritance of possessions other than the name may be matters of small importance, but the patrilineal emphasis remains. The Sgiathanach lives in a man's world. I shall explore this male dominance further in the following chapter. At present, I want to briefly discuss two additional cliques.

Religious and Age-Grade Cliques. Like the members of any society, the Sgiathanach associates most frequently with those who share his interests and attitudes. It is natural, then, for his associates, other than his kinsmen, to be people who attend his church and people of his own age group. We need not explore the nature of these cliques at this time; but we should have some understanding of their function. The religious clique is primarily a mutual aid group. There is reason to believe that this particular group has lost much of its importance of late, with the coming of the welfare state. Many feel that the government pays people to look after the aged and infirm. As far as doing a favor for someone is concerned, few of the same kirk, other than close friends,

blitz of London he was talking with a crofter's wife, and they 795 829 798
got to discussing Hitler. "What a terrible man he is," she
said, "Why he's worse than...worse than...almost as bad as the
Pope." In another township there is a Church of Scotland 795 797
missionary, a lay preacher. His religious sectarianism does
not prevent his interacting with the Free Presbyterians,
who are in the majority. Not infrequently, he visits his
neighbors and when they need help on the croft he is prepared
to lend a hand. When he pays a call, he establishes the
tempo of interaction at mealtime or tea time by saying grace
and returning the thanks. This is part of the hospitality 574 782
of the Sriathanach. The visitor is always asked to say
grace.

What is true of the township on Skye, is also partly 621 794
true of the neighborhood. Here the members and adherents of
the same church do get to know one another better because of
a common faith, or their particular interpretation of a faith
common to all. They see each other with greater regularity.
Then, too, since the congregations are small, they feel they
belong. At the same time, the patterns of interaction are
not exclusive, except in Glendale. The religious cliques are [476] [795]
mutual aid groups, doing what they can for the infirm and
destitute; they are not opposing factions. Nor does religious
homogeniety mean the absence of factions. Glendale has its
independents who are set against the disciples of the Department
of Agriculture. Anyone who knows Wales may be struck by this 795 171
difference, for in Wales the people are attached to a particular

477

477 COMPETITION--incidence of competition between economic enterprises of the same and of different organizational types; manifestations of competition (e.g., price-cutting); methods of restricting competition (e.g., price agreements, monopolistic arrangements); characteristics of competitive and monopolistic enterprises; regulation (e.g., "trust-busting"); etc.

Shawbost

463 One of his
326 apprentices was his sister's son, who built another
[874] smithy not far away. "This was the center of gossip.
[604] People gathered there while he shoed horses that came
[521] from Barvas to Carloway."

444 A number of shops were established in Shawbost
178 that sold clothing, cooking ware and groceries. At
[494] one time they numbered six altogether. These shops
also ran the first buses between the village and
[477] Stornoway. Gradually these businesses disappeared
[443] because of competition with larger companies. Mobile
grocery vans and butcher shops and bakers began coming
in the late 50's, and gradually took over the trade in
large parts of the island, undercutting the local busi-
178 nesses. Income from weaving had already weakened self-
434 sufficiency derived from the intensive use of land and
571 sea and also weakened the formerly heavy reliance on
621 local ties and mutual aid. Today an army of town-
44 dwelling entrepreneurs and employees constitute a major
463 proportion of the traffic on the island roads. Grocers,
178 fish dealers, bakers, sellers of soft drinks, garbage
[472] collectors, insurance salesmen, mobile banks, coal
[484] dealers and others extend goods and services from
centralized sources to a market which has money to pay
for them. The island's participation in this extensive
market system is affected by its marginality to the

241 Cultivation for subsistence is minimal, and in 190
654 part stems from government-defined privileges and duties
288 regarding maintenance of a croft. The Harris Tweed
477 industry, which is restricted to the Outer Hebrides and
464 thus is protected from competition, has provided work
166 for a large number of islanders. Many of the younger
[434] members of croft families live in cities on the mainland,
and send part of their wages home; they return regularly
[162] to the island, and many plan to retire there. Thus the
[632] township supplies urban workers who remain very much
attached to the rural townships, which are composed of
511 aged family members and a rural proletariat. The standard
454 of living is high, and many crofters have accumulated
273 savings, although much of this surplus is used by the men
for alcoholic drinks.

121 In Britain, rural communities have been interpreted as lying somewhere along a rural-urban continuum (cf. Southall 1959, Frankenberg 1966). In 1959, Southall presented "an operational theory of role" by which he suggested that heterogeneous societies may be analyzed and compared. He developed the concept "density of role texture" to describe societies which lie along a continuum from rural to urban. Frankenberg (1966) uses Southall's concept along with other concepts to present a more complete model of an urban-rural continuum. The "models" of both Southall and Frankenberg are essentially lists

THE PATTERN OF CROFTING

427 Crofting, a distinctive system of land tenure, is confined to Argyllshire, Inverness-shire,
241 Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland, the seven Crofting Counties o
178 Scotland. Small agricultural units sharing rights in common land, usually pasture but in some
423 districts arable land also, survive in 151 out of the 163 parishes, and these holdings form the
477 nearest equivalent to peasant communities in Britain, although only a small minority of crofters
own their holdings, and the true subsistence element, implicit in any definition of peasantry, ha
all but disappeared.

175 Before 1886, the crofter was a tenant-at-will, with no security of tenure, and no right to
427 compensation for improvements. The Crofter's Act of 1886, defined a croft as an agricultural
241 holding in a parish where there existed, or had existed, rights of common grazing, and where th
423 annual rent paid was less than £30. Security of tenure, and compensation for improvements
were the main provisions of the 1886 Act; the rent qualification was later raised to £50. In all,
there are about 20,000 crofts in Scotland today[1] and Collier[2] estimated the crofting population at
[161] about 100,000. The number of crofts in Park is 215, with population of 908. Thus Park forms
[162] a 1 per cent sample of the crofts, and a 0.9 per cent sample of the estimated crofting population.

Crofting Organisation, Layout, and Settlement.

423 The characteristic settlement unit is the crofting township: Figure 3 illustrates the areal
427 distribution of the 12 townships in Park. Each township comprises two main elements, the
241 individually held croft land, and the common grazings. The number of crofts per township
311 ranges from 6 in Caversta to 43 in Gravir.

432 The individually held croft land (1,839 acres) is partly 'outrun' or permanent pasture and the
233 holdings are usually but not always consolidated - in Gravir (Fig. 4) and Cromore some of the
crofts comprise as many as five non-adjacent pieces of land. Each croft is normally separated
from neighbouring units by a drystone dyke or fence but in Park, such demarcation is the
exception rather than the rule.

The croft land is separated from the common pasture by the township dyke, a stone or turf wal
The Park common pastures consist of 22,023 acres of moor grazing - generally very poor, ill-
drained land with a large percentage of bare rock, areas of peat, and numerous lochs. In Park,
only Oronsay common pasture is fenced, the limits of the remainder being faintly marked by
crumbled turf dykes. Each croft has a defined right of grazing or 'soum' on the common pasture;
the 'soum' is the number of beasts which may be pastured, a term comparable to the
obsolescent 'gates' of northern England. In Gravir, the soum is 1 cow and follower or young beast
up to 6 quarters old (i.e. 18 months), and 8 sheep, per £1 rent. There is also a system of stated
equivalences (Gaelic 'coilpeachadh') in most townships whereby substitution of cattle for sheep and
sheep for cattle is permissible: in Gravir, the exchange rate is one cow for five sheep. Soumings
and equivalences vary throughout Park. In former times, when a subsistence economy prevailed,
soumings were enforced but nowadays the majority of the crofters do not even know the souming of
their croft.

195 a crew member. Another family is called "cook," the
222 first job which a novice had to assume when he joined
255 the crew of a fishing boat. One of the last men to go
288 up the east-coast fishing in about 60 now, is the man
355 same back from the fishing in time to bring in the oats,
388 barley and potatoes, and the money was used for rent
422 and the purchase of various foodstuffs and other goods.
455 They usually brought enough rolls of wallpaper to cover
488 the stone-walled or wood-lined *sigh dubh* (black house)
533 for another year. Twenty pounds were good wages for a
566 season. While the men were away at the fishing, the
599 remaining members of the family lived on benefits from
632 the local shops, and depended on the good will of
665 their neighbors.

195 Many men joined the armed services, and were
222 especially sought after by the Navy and the Merchant
255 Service. In 1900, there were 2,800 lewismen in the
288 Naval Reserve.

Around the turn of the century, until the first
world war and the growth of the weaving industry, the
girls used to "follow the fishing." "Everyone came to
this boat to see you off. You could go all the way to
Aberdeen for 10/6 on a special fish-worker ticket."
The girls went from the south of England to Shetland
in the far north.

233 As these quotations bring out, the subsidy enables
266 people to risk raising cattle under conditions that
299 would otherwise make success very uncertain.

476 2. Communitas: Despite the decline in various
509 agricultural activities and the individualism of land
542 use, some activities persist which require mutual aid.
575 Conditions of low geographical mobility, in which mutual
608 watchfulness and competitive gamesmanship have developed
(see section on "Social Marginality"), contribute to
the strong boundedness of the township network. There
is still competition over who begins an agricultural
activity at a particular time of the year. No one wants
to be so early that he stands out like an over-eager
novice running risks of frost or other bad weather, but
there is an element of pride in being the first to
harvest potatoes or bring in the peat. Almost everyone
does peat, a time-consuming and back-breaking job made
bearable with a large lubricant and every aspect
of the activity--the time of cutting and bringing in,
the length of time required to cut peats, the size of
the peats when dry, the type of meal served to the work
crew, the ceremonies of the final peat stack--is subject
to intense scrutiny.

463 One of his
496 apprentices was his sister's son, who built another
529 smithy not far away. "This was the center of gossip.
People gathered there while he shoed horses that came
from Barvas to Carloway."

464 A number of shops were established in Shawbost
497 that sold clothing, cooking ware and groceries. At
530 one time they numbered six altogether. These shops
563 also were the first house between the village and
596 Stornoway. Gradually these businesses disappeared
629 because of competition with larger companies. Mobile
662 grocery vans and butcher shops and bakers began coming
695 in the late 50's, and gradually took over the trade in
728 the parts of the island, undercutting the local busi-
761 nesses. Income from weaving had already weakened self-
794 sufficiency derived from the intensive use of land and
827 sea and also weakened the formerly heavy reliance on
860 local lies and mutual aid. Today an array of town-
893 dwelling entrepreneurs and employees constitute a major
926 proportion of the traffic on the island roads. Grocers,
959 fish dealers, bakers, sellers of soft drinks, garbage
992 collectors, insurance salesmen, mobile barber, coal
1025 dealers and others extend goods and services from
1058 centralized sources to a market which has money to pay
1091 for them. The island's participation in this extensive
1124 market system is affected by its marginality to the

181 People prefer to give money
214 in exchange for car rides or other help, including peat-
247 cutting, because "then you're independent." Friendships
280 are still weak, relative to friendships in urban
313 settings. Most informants which is shared between
346 individuals rapidly enters the pool of communal gossip.
379 Although many persons emphasize the importance of mutual
412 aid in defining a friend, some emphasize the ability to
445 confide and keep secrets.

Today many of the younger villagers do not know
their relatives to the extent that their elders did.
In one family, a girl who was about to get married had
to ask her brother's name, who was the only one of the siblings
interested in kinship connections, to invite to the
wedding. It is still useful to retain an inventory of
one's relatives. "I have cousins in Glasgow and
Australia that I've never seen, but if I ever go there
I'll have a place to stay." With the increase in
transportation and income, more islanders are taking
brief trips away from the island. During these trips,
they almost always stay with relatives.

It is frequently said that children are now "obnoxious,"
less inclined to run errands and chore orders meekly, and
that they prefer to watch television or read books by
themselves to playing with each other.

154 sympathetic with each others' idiosyncrasies. A constant
187 joking keeps people at arm's length and discourages the
220 intrusion of empathy.

Accompanying this style of indirect, inhibited
expressiveness and the low level of stimulation are
culturally prescribed opportunities for relatively
uninhibited expressiveness. Such opportunities include
the *ceilidh* ("visit"), the drinking situation (mainly
for men), the role of clown or "character," and holidays
464 much as New Year's. Although young villagers and
464 emigrants often describe the village as "dull" and "dead,"
881 the emigrants are happy enough to return to the island
for short periods of time, during which the participants
in these situations in which expressiveness and limited
license are accepted.

2. Ceilidh, Clown, and New Year's Festivities: Only
on certain occasions is relatively spontaneous and uninhibited
expressiveness condoned or encouraged within the
township, and even then the form which this expressiveness
takes is fairly narrowly circumscribed. The traditional
1092 *ceilidh* was such an occasion. In the past, people gathered
1125 informally at night in the *high ceilidh* (low *ceilidh* house,
1158 or home of someone in which a genial atmosphere existed;
1191 the *high ceilidh* was often the home of someone who lived
alone), where stories were endlessly repeated and elaborated,

529 Whereas at other times of the year there are specific
562 times which are considered appropriate for visiting,
595 especially if the visit includes a bottle, at New Year's
628 visitors may appear in the middle of the night or at
661 any time during the day. Some men may stay up for four
694 nights in a row, going back home for a few hours of sleep
727 or a bite to eat before setting off again. Various pranks
760 are played. Men climb through the window of darkened
793 houses, or wake up sleepers by making animal sounds. One
826 man went around the village showing a pig's foot to women
859 as though it were a penis.

But whether lasting for one night or for five,
festivities end with the arrival of Sunday; and the usual
common is, "Thank God it's Sunday."

The "exiles" prefer to return at such times as New
Year's, or during the summer months when the leaves are
blooming and the gales absent. They remember the
"characters" and other features of village life which
give it color, often forgetting the drab background out
of which the color was forged. Some villagers whose
siblings have married and left the island continue to live
alone in the house mainly to keep the house in order for
their return. "I wouldn't clean the whole place up then. They
come back every summer." A man thinking of emigrating

164 says, "I'll have to ask my brothers and sisters if they
197 mind, since they come back here every year." Some houses
230 which are almost empty for most of the year are over-
263 flowing during the summer months. Often the visitors
296 must come in stages.

The "exiles" sing the old songs with vigor, drink
heavily during their visit, and praise the island for
that "special quality" which is unmatched by life in the
direct, crowded, unfriendly city. Some plan to retire to
the village. The villagers take up the tune that their
society is eminently worthwhile. When talking to strangers,
they ask questions pertaining to this image of themselves,
such as, "Don't you think this place has something which
you will never find in a city?" "People come here during
the summer and they love it; they can't sleep away. So
they must find something here. What would you do in a
city anyway? Out here you're free."

The visitors not only bolster the self-esteem of the
islanders, but provide them with a fund of gossip. "You
summer visitors always turn things topsy turvy when you
come." Tales of the adventures of the summer visitors
helps to relieve the long winter nights of the islanders.

A comment frequently heard is, "He was awfully home-
sick leaving." That is, he was already longing to be back
on the island, his spiritual home. The image of the island

164 The image of the island
197 as spiritual home is fostered by The Stornoway Gazette,
230 read by nostalgic songs, most of which were written by
263 islanders who migrated to Canada in the first quarter
296 of the century.

The "exiles" sing the old songs with vigor, drink
heavily during their visit, and praise the island for
that "special quality" which is unmatched by life in the
direct, crowded, unfriendly city. Some plan to retire to
the village. The villagers take up the tune that their
society is eminently worthwhile. When talking to strangers,
they ask questions pertaining to this image of themselves,
such as, "Don't you think this place has something which
you will never find in a city?" "People come here during
the summer and they love it; they can't sleep away. So
they must find something here. What would you do in a
city anyway? Out here you're free."

The visitors not only bolster the self-esteem of the
islanders, but provide them with a fund of gossip. "You

sick leaving." That is, he was already longing to be back
on the island, his spiritual home. The image of the island

213 differentiation and differentiation in personal experience,
246 but to use it in the community, as social coin. The few
279 men who refuse to get involved in drinking episodes that
312 initiated on the basis of their available funds are called "mean"
and "tight-fisted."

"If I had a wish, I'd choose to live the same life all
over again, maybe a wee bit rougher. We don't get a chance
here. The poverty keeps us down. But what does it matter
to be a schoolmaster or a crofter? Services for young people, that is,
are serious enough to convert. These services,
which last from Monday through Friday, were started in
Ness after the first world war.

4. The Commission (Communitas): Communitas are given
twice a year, during autumn and late winter. They are
scheduled for different weeks in different parts of the
island, and neighboring congregations close their churches
when Communitas are being held nearby, so that during the
Communion season some persons may attend a number of
services at different churches.

In the days when transportation was limited, visitors
coming from a distance away stayed for an entire weekend.
All households prepared food and made ready for any overnight
guests who might arrive without prior warning.
Guests often slept on mattresses laid on the floor. After
facilities of transportation improved, it became common
for people to drive down for the day in private cars and
return to their own homes at night.

(Page 159 is blank; text continues on p.160 --Analyst)

into tiny squares. The ministers and the elders partake
A final hymn is full of rejoicing, and the minister
then exhorts the communicants to return to the world and
give witness of a live exemplary life.

The evening service on Sunday is evangelical, intended
for non-believers. After this service the communicants
conduct a brief prayer meeting to give thanks.

On Monday, the minister again tells the communicants
to go out into the world and declare publically their
experiences of the preceding days and to demonstrate in
everything they do and say that they are believers. In
the past, only a morning service was given, as most people
had a long journey ahead of them to return home; but now
that cars are available,a similar evening service is also
conducted.

2. The Process of Conversion: The process of conversion
may be sudden, but conversion is most common among
middle age and among women. One informant wryly observed,
"Only recently women were allowed to have souls. But
from the looks of the Communion table, mostly women are
going to heaven." Many of the women taking Communion are
dressed from head to foot in black, a color which indicates
their widowhood.

The first sign that a person is "Following" (Jaantail)
the church in that he begins to attend the weekly prayer

Chapter 7

Conclusions:

Summary and Theoretical Considerations

A. Summary

Crofting township of the Highlands and Islands of Scotland was within a few hours' travel of the major cities of Britain. An extremely high percentage of the crofting people in the crofting counties attend universities and other institutions of higher education. Politically, administratively, economically and in other ways, the crofting population participates in the larger urban-industrial society of Britain.

Despite this participation, the township-qua-village community is a relatively strongly bounded system. This thesis investigates factors contributing to the strong boundedness. From a relatively self-sufficient economic unit using agricultural practices suited to the extensive cultivation of marginal land by smallholders, the township has during recent decades changed to one dependent on goods and services provided by the larger society. Crofting activities nevertheless persist, in part because of the incentives offered by government bodies such as the Crofters Commission and the Department of Agriculture. Crofting

After being discharged from the army, he married the Shawbot
girl he had been courting, but soon after returned to
Glasgow in search of work. A doctor advised him to quit
the factory job he had found because the dust endangered
his wounded lung. He then attended a technical college
for eighteen months in preparation to set up his own
business, a bakery; and again, his wound defeated him.
A doctor advised him that a bakery filled with flour was
the worst environment imaginable for his condition and
should go back and work the land on the islands, where
the air was clean. He returned to Lewis and to the
croft, and when his sons were old enough they assisted him
with croft work and weaving. He still makes a yearly trip
to Glasgow.

The Bodach Beag

"The Bodach Beag" is known for his shrewdness,
industriousness, mechanical ability and kindness. He is
one of the many Lewismen who left the island in 1924 on
the ship called the Metagama, and like many others he
returned to the island during the depression. His eldest
brother survived the sinking of the Iolaire, the ship
returning home with survivors; after the war this man
not far from the Stornoway harbor in 1919, and was never
well afterwards. "He would sit in at night, off by

4 COMMUNICATIONS

FROM the earliest times, the provision of communications in one form or another has been a matter full of incident and high colour. Gaelic folk-song contains many references to the hazards of crossing the impetuous waters of the Minch. One such, a wassailing song still known today, commemorates the death of Iain Garbh Mac Gille Chalum, of Raasay in Skye, who was drowned in April 1617 on his way home from visiting the Earl of Seaforth in Lewis; it is said that he was drowned through the workings of his cruel 'muinn', or footwomen, who employed several famous witches to raise the tempest in which his ship was wrecked.

For well over a century the subject of adequate communications has aroused continuous argument. The strength of any island community lies in its ability to live within itself, while accepting the periodic injection of certain external items necessary for living or for work. A Londoner once expressed amazement at the isolation of Scarp, in West Harris, commenting that in Scarp they would not know what was happening in London. The indignant reply was: "We do they know in London that a fishing boat would be doing in Scarp." However, to a large island community, with a certain degree of economic significance, communications are the basic lifeline.

SEA ROUTES

When in the early 1800s formal sea communications were being established between the island and ports on the west coast of Scotland, down as far as the Clyde, the main communications were those little cried. Except for the professional clames (merchants, ministers and the like), they had little use for the sea links provided for them. Their economy not yet in the money economy, and travel was thus a luxury they could not afford. As the nature of local life began to change with the infiltration of some of the

SEA ROUTES

trappings of nineteenth-century civilisation, however, they grew to depend on items brought by sea. Imported food, clothing, wood, metal domestic utensils and the like were absorbed into an increasingly varied range of everyday articles. But there was relatively little export in return; then as now, any transport operator struggled with the fact that traffic was one-way and the freight charges must pay for the double voyage. Though the fishing industry and later the Harris Tweed industry were assured the turn of the century, to do much to determine and stabilise shipping developments, both passenger and cargo services were always facing loss rather than profit.

On the social side of the picture, the regular call of ships to the island, to Stornoway in particular, was a welcome, if not necessary, sign that the island was significant in some way to the outside world. The ships brought visitors who made the island, and the Hebrides in general, better known to other prospective visitors. The exposure of the island and its folk to the gaze of the mainland led to a wider knowledge and understanding which without doubt brought improvements in social welfare and a basis for economic development. When many islanders found it necessary to go to Glasgow and the mainland for work, the ships of the Minch served as a firm link with home, to which they returned whenever they could. The factor not until Sir James Mackenzie's death was to be doing in Scarp.' However, to a large island community, with a certain degree of economic significance, communications are the basic lifeline.

SEA ROUTES

When in the early 1800s formal sea communications were being established between the island and ports on the west coast of Scotland, down as far as the Clyde, the main communications were those little cried. Except for the professional clames (merchants, ministers and the like), they had little use for the sea links provided for them. Their economy not yet in the money economy, and travel was thus a luxury they could not afford. As the nature of local life began to change with the infiltration of some of the

COMMUNICATIONS

There were, of course, other types of flights before 1948. In
1937, Captain Fremon took the first silk person off the island
in his Short-Scion, the beginning of the air-ambulance service
to the islanders. During World War II, certain RAF mails were
flown between Glasgow and Stornoway, on which there were
first covers. December 1940, Glasgow/Stornoway; December
1943, Stornoway/Glasgow; and January 1944, Glasgow/
Stornoway. The present air services are supplied by BEA and
Loganair Ltd. The BEA plane route is Glasgow/Benbecula/
Inverness and return. Loganair offer a service Glasgow/
Benbecula/Stornoway and return. In recent years this small firm
has built up a most valuable inter-island air link.

OVERLAND ROUTES

The history of overland communications in the island is a short
one, though it does, like American history, have many character-
istic features. It is a history of the transition from a time when
was simply a matter of following well-worn tracks across the moor-
land, skirting lochsides and marshy lands and just taking the
shortest distance possible between starting and finishing points.
Considering the length and breadth of the island, it is surprising
that it was not until Sir James Mackenzie's generosity to Lewis
road-making was undertaken with any determination. This
activity stemmed largely from the desire to get something in return
for the outlay involved in keeping literal death from American
clear of the doors of the island folk.

The report of the Rev James Headrick (prepared for Lord Sea-
forth in 1800 and published about 1820) indicated that the pro-
vision of roads would be of great benefit to the island. A footnote
to the report (of probable date 1816) urge assistance from Parlia-
ment or the Board of Fisheries to complete the road from Storno-
way to Loch Roag, which had been begun by Lord Seaforth.
There is a bitter complaint that though the Seaforth property
bears a large share in the county assessment, 'not a penny of
public money has ever been laid out in Lewis'. Another footnote
records that the road from Stornoway to Aignish in the east was
made in 1815. No large undertakings followed Mr Headrick's

COMMUNICATIONS

When LORD LEVERHULME'S FISHERIES
be pulled out of Lewis to go south to Harris,
he offered—such was the character of the man—to thanks for
the '98 per cent support' he got from the people of Lewis, to each
Lewis crofter-fisherman croft as a free gift, and he offered to go
together with all his property in Stornoway, to the people of the '931
town.

In 1919, Leverhulme became proprietor of Harris, and con-
centrated his efforts in Obbe, now called Leverburgh, in South
Harris. The harbour at Obbe lacked the natural advantages which
Stornoway had, so he spent large sums on making it navigable;
Rocky obstacles were blasted away; numerous buoys and beacons
were set up to guide vessels into harbour; new quays were built;
and kippering sheds, and other buildings necessary for packing
and curing herring were erected. Among the other amenities given
in Harris were the provision of a mill for making tweeds, and he
put into effect the idea of the 34 miles of road between Leverburgh
and Finsbay. In 1925, after a visit to the Congo, he died in Brussels.
His Harris scheme came to an abrupt end. And the remains
of his activities in Harris are still to be seen in the ruins of the
little township named after one of the most stormy of boisterous
petrels that Britain has ever seen.

Tourism

Tourists has always been a perfunctory and casual affair, until
the introduction of the fast ferries which now link the mainland
(via Skye) with the Outer Isles. Some 1000 tourists a year came
from Skye to the Hebrides. In 1913, the Stornoway Tourist
Association had a struggle to increase the number of visitors to
the town, to make it as a tourist resort. It is much the same
today with the Western Isles Tourist Association, which is having
difficulty in integrating tourist facilities with crofting activities. In
Lewis, the Stornoway Trust has assisted in establishing pony-
trekking, a venture which has the potential to mirror the success
of a similar one in the Isle of Skye.

PRESENT INDUSTRY

Almost an echo of the kelp-burning industry is the alginate in
Harris. It provides employment for only small numbers, but is a

COMMUNICATIONS

factured goods and foreign produce. There is a Branch office of
the National Bank of Scotland, two friendly societies, four inns,
and so many as about a score of dram shops. The annual public
revenue was £17 3s and the expenditure £15 17s 6d. There
were about 600 inhabitants, a new mill, a mill for carding wool, a
corn mill, a very large malt barn and mill, and an extensive dis-
tillery. These buildings were constructed 'in a style not much in-
ferior to the best buildings of their class in Scotland'. A stranger
on arriving at it by any route, or from any quarter, is surprised
to see as large and flourishing a place in so remote and barren-looking
a corner. In broad field of houses, in capacious bay, and spacious
piers, in occasional crowd of shipping, and air of trade and gaiety,
and contrast of the aristocratic mansion and the cottage of the peasant,
there is a vivacity and very welcome relief to the prevailing
monotonous, sterility and inertion of the rude country in which it is
nestled.'

In 1901, when the West Highland line was opened, the return
fare from Mallaig to Stornoway by MacBrayne's steamer was
14s 6d. One could go from Glasgow to Stornoway by steamer
31s 6d return. A Guide for that year indicated that Stornoway
had three hotels, six churches and a Court House, singled out
for specific mention for some reason. A Rose-bowl Directory of
1911 describes the Nicholson Institute as one of the finest Higher
Student Centres in the country. In Leaving Certificate results were
the best in the north of Scotland, with a total of 300 higher and
234 lower passes, and no less than 20 passes in Higher Science.

Stornoway is a Burgh of Barony, dating from 18 October 1607.
It had, of course, been a town of sorts long before the Charter
was granted by James VI; the Charter was executed under the
Great Seal conveying equal shares to three of the leaders of the
Fife Adventurers. Under the Police Act of 1862 Stornoway became
a burgh and under what is now the Gaelic Versions of its main-
tained for hardy trekkers, the Scottish Youth Hostels Association
making a grant for running costs. Many visitors have found their
way to the town in search of the peace of happiness corresponding with its
remoteness from civilization.

A HARRIS VIGNETTE

Fourteen employees were directly concerned, with another six in
the service sector.

The potential of the tourist industry is only beginning to be
tapped. MacBrayne's drive-on drive-off car ferry, with a capacity
of 50 cars and 600 passengers, makes two or three trips a day
between Uig in Skye and Tarbert, the journey taking less than
two hours. The maintenance of tourist accommodation in Harris are
the Tarbert and Rodel Hotels, both well appointed and owning
fishing rights for salmon and trout. Sea fishing is another tourist
attraction. Crofters participate in the holiday trade by providing a
full board or bed and breakfast, caravans, caravan sites or vacant
lots.

An interesting tourist venture has been started at Rhenigidale.
A rough, stony track, one of the most tortuous and exciting in
Britain, takes the visitor from the end of the road at Tarbert, 'up
and turns in and out of gullies, over cliffsides and across the steep
heather-clad slopes of the Todhum, a dramatic little hill of 1,750 ft
which protects Rhenigidale village from the Atlantic gales. The
seven-mile track is the only marked route, though crofters take
a shorter way to the north west parishes begin; the local postman
makes a round of about 60 foot miles in the week, walking this
track and on to Tarbert and Stornoway and back again. He
relies on in sheltered harbour with a good natural rock pier; 'the
most communication is by water, all food and fuel coming this
way, best in the north of Scotland, with a total of 300 finfish and
shell fishing to supplement both diet and finances. Today the
interest in fishing has declined, as has the population. But in 1946
Mr Herbert Gatliff paid his first visit to Harris, discovered what
the island had to offer, and started a campaign to convince
travelling interests of the need to make some investment in the
Western Isles. A croft house in Rhenigidale was in 1961 equipped
as a hostel, and under what is now the Gatliff Trust it is main-
tained for hardy trekkers, the Scottish Youth Hostels Association
making a grant for running costs. Many visitors have found their
way to the town in search of the peace of happiness corresponding with its
remoteness from civilization.

ion on travel, such as for vacations, see category

528; or for work on the mainland, see

The flesh of puffins, gannets and fulmars
361 was the staple diet of the St Kildans; the oil and feathers were
162 the vital exports that paid the island rent to MacLeod of Harris,
*175 the owner of the group. These exports also helped to pay for the
[262] purchase of such foodstuffs as salt, sugar and tea, and other items
[427] which the island could not itself supply. The St Kildans owned
some hundreds of sheep, the wool being spun and woven into
[236] tweed, and a few cattle were also kept. But the seabirds were the foundation of the island economy.

The factor which led ultimately to the desertion of the island group was isolation. The community there was throughout its history undoubtedly the most isolated in the British Isles, though until the present century this mattered little to the St Kildans. All that was deemed necessary for the continuation of the com-
[438] munity was that, once a year, MacLeod of Harris should send his factor over from Skye to collect the island goods that were to be sold, and to bring with him those provisions which would see them through another twelvemonth. However, as the demand for
[178] the island's products declined, communications became more im-
[464] portant: to support the family a man had to leave to find work on the Scottish mainland. Large-scale emigration began in 1852
[167] when thirty-six islanders (with State aid) left for Australia. Island life was punctuated by loss of life; boating disasters and cliff-falls in particular deprived the community of the vital male elements needed for survival. Tetanus infantus, known on St Kilda as the
[164] 'eight-days' sickness', strangled two of every three babies born;
[165] this disease ravaged the island for almost a century and again struck harder at the male sex. About 1810 the population was about 200, a definite overcrowding. By 1861 it had fallen to 78; in 1911 it was 80, and in 1921, 73. A decade later it was nil.

484 Isolation tended to make the St Kildans a human menagerie.
361 With the improvement in boat services, St Kilda became a 'must'
*175 on tourist itineraries. The tourist trade took on an economic importance for the population after July 1877, when the *Dunera Castle* steamed north and west for a voyage to the 'romantic Western Isles and lone St Kilda'. The steamers continued to call throughout the three summer months annually for sixty years, their passengers eager to buy souvenirs: tweed, quern stones, spinning wheels, stuffed birds and eggs; indeed, anything to remind them,

and to show their friends at home, that they had braved the hazardous Atlantic seas to visit St Kilda on the very edge of the world. The tourists were charitable, but this brought a psychological evil in its wake. In 1886, Robert Connel wrote: 'One cannot be long on the island without discovering the great moral injury that tourists and sentimentalists and yachtsmen, with pocketsful of money, are working upon a kindly and simple people.' It was estimated that the islanders collectively derived a profit of 5s from each of the 200 or more tourists who arrived during the short summer.

The new influx of cash into a community which required money as an exchange commodity because the original native produce was becoming less saleable, hastened the decline of effort to be self-supporting. The numbers of seabirds slaughtered steadily fell; paraffin oil replaced the traditional bird oil in St Kildan lamps. The need for daily work, to toil in fellowship with others, was dissipated; the islanders could purchase most of the food they required, provided communications with the mainland were maintained. The population was in any case dwindling, as St Kildans became more aware of 'the other life' available on the mainland of Britain.

Finally, on a misty summer's day in August 1930, at a cost to the nation of little under £1,000, St Kilda was left to the care and keeping of the changeless Atlantic. It is now preserved by the National Trust for Scotland as a crumbling monument to a small human tragedy of a kind that has been repeated, and will be repeated, in other small communities who cannot argue out the case for their survival in terms of economic viability. The island is now occupied by military personnel in connection with the Hebridean rocket range on South Uist.

St Kildans were described by Dean Monro, in 1549, as 'simple, poor folk, scarece learned in any religion'. In 1698, Martin Martin published *A Late Voyage to St Kilda*. He went there in the company of a minister who had been summoned to the island to denounce a certain false prophet who had risen among the 180 inhabitants (pretending he was an emissary of St John the Baptist). Martin found, as did later visitors, that the island economy and the quality of its life were closely dependent upon its birds,

LIFE TODAY

LIFE TODAY

As in other Highland areas, some of the island's problems have become so deeply entrenched as to be intractable. They have been the *raison d'être* of so many commissions and committees of inquiry that their existence is now almost forgotten by the islander — if indeed he ever understood their nature. Some results have been seen, such as the Crofters Act of 1886 which gave Highland crofters security of tenure, perhaps the most valuable measure of the last century or two. But sometimes all things have not progressed so well since that date; at any rate not so fast that crofting, for instance, is now seen to be an economic form of land use of benefit to both local community and nation at large. Many problems have been virtually ignored by successive central Governments; at least, remoteness seems to qualify a topic for the office 'problem' very. It has yet to be fully realised that the island, with other Highland communities, is part and parcel of the area generally administered from London and Edinburgh, and merits as much attention to its welfare as other European governments, such as Norway, give to their remote mainland and island communities.

As usual, charity and self-help begin at home, and one of the most dramatic changes in island life has been the rapid rate of agricultural revolution of recent years which is changing once-brown moors to lush green pastures : reclamation by re-seeding. This revolution is still going on. Lewis crofters in particular are showing the way, with other Highland crofting areas following suit. The change in the Lewis scene is being emphasised by the planting of shelter-belts of hardy trees and the first of the new plantations of timber-producing trees. These show the promise of the future : a lively future for a lively community. The fishing industry also has a future, brighter on the horizon than it has been for many a poor year. The Harris Tweed industry, the staple employment-source in Lewis, is maintaining its ability to retain the interest of the market. And tourism, once a perfunctory and casual affair, promises to emerge as a useful source in the economy. There are, in addition, many small pockets of native initiativeness and enterprise which, given sufficient encouragement

ISLAND LIFE

and practical support, could win through to make marks on the island scene.

A significant event occurred in 1964 : the establishment of the Highlands & Islands Development Board. This was Britain's first regional development authority run by members who are either full- or part-time. The Board is grant-aided and has two broad functions : to improve the social and economic condition of the Highland people and assist in making the region more significant in a national context. The Board's attention in the Western Isles has been concentrated in the expansion of the fishing industry and the development of tourism. In both these fields there has been a considerable success : upwards of 100,000 visitors per annum visit the islands; and a fleet of over thirty boats, equipped with the latest gear, operate out of Stornoway.

Also in 1964 was produced the Development Plan for the County of Ross & Cromarty. So far as Lewis was concerned, the Plan was based on an average decrease in population of some 1,500 persons for every year in the future of the island. This, if carried to its logical conclusion, will see complete desertion in fifteen years or so! However, even if nothing further is done to halt emigration, particularly in the landward areas of the island, the population will remain around a stable 15,000. The County Development Plan contains much food for thought, but as with most county plans, does not indicate actual development projects. Rather, it lists all the resources of the island for the attention of those concerned. Potential developments include the setting up and exploitation of predominantly-fulltime crofts, shell-fishing, and inshore white fishing, herring and offshore white fishing, forestry, tourism and holiday accommodation, minerals, peat utilisation, hill-land improvement, marine reclamation and reserved resources. What is significant and merits the attention of the Highlands & Islands Development Board.

Harris, on the other hand, presents possibilities on a much smaller and limited scale. However, there are expansion potentials in tweed, knitwear, and craft industries, with tourism promising to be a good base for the island's economy. As the age-structure of the crofting population changes, there will be a useful re-organisation and enlargement of existing holdings to make for

COMMUNITY FROM PAST TO PRESENT PT. II

Clanranald[1] and echo in the opening benediction of Alexander Macdonald's *Turtlins of Clanranald*", without which his 'Galley', for all the glory of its strife with storm, would never have won its place in the heart of the seafaring Gael.

As for journeys over sea, so for those over land, "Traversing corries, traversing forests, traversing valleys, long and wild . . ", the traveller or pilgrim, the drover or emigrant, leaving home and his friends, would have their prayers. They would accompany him on the first steps of the way with cheer and laughter or with tears, as those have told me who remembered my grandfather's leaving his home in Strath Spey more than a century ago. These journey-blessings were spoken by the traveller : " Life be in my speech, sense in what I say . . . ", or by those to whom he was dear. (*Carmina, Vol. 2, p.16; Guidhean Turais*, Nos. 266-276.) In these prayers, bodily travel and spiritual quest are sustained on the mountain-track by the strength of home-ties and fellowship, and by the hospitality of Christian on the path ahead.

When family and neighbour-team were closely knit, their own harmony drew the stranger in. " The Rune of Hospitality", threaded together from old fragments by the Kennedy MacLeod, breaks out into the refrain of the lark as she sings to the listening host : " Many, a many, a many a time, Comes the Christ in the stranger's guise! " [2] Hospitality is truest when its sacrifice—so real in a land of poverty—is given as a duty but with a smile!

CHAPTER SIX

AIRD

by

Madge Phillips.

The little township of Aird is an isolated and old-established crofting settlement along the western shore of Loch Ness, about two miles south of the Achnahannet Cafe on A-Route three miles north of Cromdale. Aird is approached by a winding road which ascends steeply through a gorge (at the mouth of which are the ruins of the old corn-mill), then crosses a wide plain and descends to the lower side of the township by way of Carnoc on A-Route. The crofts, roughly fan-shaped in arrangement and varying in size from 3½ to 7 acres, each originally included a narrow strip of the flood-plain, stretching across from just beyond the right 'rub of the river, up the steep, rocky slope above the half-built and widening out over the more gently slopes between the 150 ft. and 300 ft. contours. A number of the crofts were subsequently extended larger, gaining extra land on the right bank of the stream, whilst others received additional ground to the north or south.

1. [See figures 12 (facing p.24) and 17 (facing p.29)—ann:yet]

[Service] [Dissapoint] [Tenure]

The Wrax Hill Community Twenty-Cord Smallholdings Scheme is predominantly a living community. The remote and not easy crofting scenes are under lodge and cost 1957 Scheme. Wrax Hill is a 1 mile from Wrax Hill, Wrax Hill is a 1 mile from Wrax Hill, Wrax Hill is a 1 mile from Wrax Hill,

parents and to Sabbath school, nor would they allow children 774
to play games in the house. Today the children of the Church 775
of Scotland people are allowed to go for a walk, ride, or 776
play games. Tourists, frequently, if not always, indifferent 485
of the strict Sabbath, have no doubt contributed to this 777
relaxation of tactics. Although a further development of the 778
tourist industry would be advantageous economically, tourists
have a interest not only in the Sabbath but also in the whole
religious complex. They set examples which the youth are
only too ready to emulate. Before the war every hotel on 485
the Island, including all in Portree, and every boarding 779
house posted notices requesting visitors to refrain from
using their cars for touring on the Sabbath. In many of the
guest houses the request was the equivalent of a warning of
removal. Today the signs are gone. Still not content, the
tourist agencies in England and the Lowlands continue to make
snide remarks in their literature, advertising "a little more
tolerance is needed in certain quarters." The youth and some 774
adults of Portree now have begun to go off for a drive around 775
the island. One reason why the Sabbath is still strong in
Kilmuir and Glendale is that tourists are not accepted in
either district.

Strict Sabbath observance distinguishes three broad 780
groups on the Island. Portree is set apart from the crofters 781
by laxity, and the county people are set apart from the 782
crofters by using the day for visiting and having afternoon
tea together. The gentry, of course, are not under the

There are 144 crofts in the village (nine of
which, in South Shawbost, were added after the
beginning of the century by non-crofters encamped on common grazing
land who applied to the landlord for crofter status).

Thirty-four (almost a quarter) of these crofts are
vacant; that is, the holders of the crofts live elsewhere. One of the vacant crofts is used by its absentee
tenant for holidays, and one sports a trailer (called
a "caravan" in Britain) which may be rented to tourists
during the summer. The rest are cultivated or used for
grazing by crofters or non-crofters in the village who
by inheritance or by formal or informal subletting have
the use of the land.

A little over half of the crofts are worked as
individual units; 44% of the crofts are worked as
combined units of two and three. Twenty-four men have
the use of two crofts each, and five men the use of three
crofts each.

16 A feature of crofting townships usually emphasized
in their disproportionately large number of aged people
and small number of young people, who tend to migrate
to the cities. An age-sex "population pyramid" of the
Highlands is not a pyramid but a top-heavy hourglass
(see Table 1). Most persons of child-bearing age have
migrated from the area and the number of children is
[See p.vii-Analysis]

on these occasions. At some point during the night the
bride and groom were prepared for their wedding night
together. The bride's female companions undressed her,
prepared her for bed, and put her into the bed with a
hot water bottle. She shared some sherry with them,
and they went out, whereupon the groom was brought in by
his male companions. After much joking the couple were
left together.

On the third night, a dinner was given for the older
persons who had not been able to come to the "pig"
wedding.

For some time after the wedding, the married couple
visited relatives and neighbors who had been unable to
come to the wedding, taking a bottle of whiskey with them.

Wake weddings declined in number during the war when
food was rationed, and as more persons changed from the
"black house" to the modern cottage, and more
elaborately furnished "white house." Most weddings are
now held in hotels, and consist of a single wedding dinner
and dance; they are often held on Thursdays, the day of
the herring in the past. The emphasis on community participation still exists: even though the practice of holding
hotel weddings has limited the number of guests, an
effort is made to invite someone from each household in
the village. In part to avoid disappointing the

return to their own homes at night. There is now less
need for the generalized hospitality of the past, which
was given to anyone who came to the door of a crofter's
house. Through these visits some families in
different villages have, however, established relationships which are kept up by exchanging hospitality at
times of Communion and also in other ways. A family in
Ness may send to a friendly family in Shawbost some smoked
goslings of solan geese which are captured by Neamen
on the island of Ross once a year and are salted to make
a delicacy that is in great demand. Through such contacts
a family wanting to purchase a cow may receive word of one
that is being offered for sale in the village of a
Communion contact.

Services of Communion last five days. All services
except that held on Sunday evening are intended for the
communicants or full members of the church, who are called
"the believers" and "good livers." During this time, no
dances are held in Shawbost, and in Carloway the hotel is
closed.

On Communion Sunday, the upper balcony of the church
is filled with villagers watching to see if any of the
recently converted have decided and have been allowed to
take Communion. Because the villagers watch very closely
the behavior of everyone else within the village, any change

FISHING

of Lord Seaforth's conduct in this matter. They alleged that he
'drave in hither an number of strangers who daylie resorts to and
fra Holland to the Lewes and continent next adjacent (the Roman
mainland peninsula) and has caused them be answered of all
such commodities as these bounds affords, as namell with fishes
and herrens quhilks with the hyde and tallow, with manie uthers
commodities they transport to Holland.'

To satisfy the Royal Burghs, Seaforth had some of his Dutch
friends sent away. But several Dutch families remained in Stornoway until the outbreak of hostilities between England and
Holland in 1653.

In Harris, similar efforts were promoted by Captain Alexander
MacLeod, who in 1779 bought Harris, together with St Kilda,
for £15,000 from the commissioners acting on behalf of Cromartie
Norman MacLeod. The latter had, in 1772, inherited from his
grandfather both the clanship of Harris and a debt on the
property amounting to some £50,000. Captain MacLeod, who
skippered the East Indiaman *Mansfield*, did much to stimulate
better conditions in Harris, and advocated the generation of a
fishing industry. In the face of opposition and ridicule he showed
by practical example what could be done to make a success of
the herring fishings, introducing a number of east-coast fishermen with Orkney twaits to teach the inhabitants, and reaping a
good harvest from the fishings off Scotland. The fishing stations
were offered by the Harris-folk. He improved the local harbour
accommodation and erected a storehouse for salt, casks and nets
like, he built a factory for spinning woollen and cotton thread
and twine for herring-nets; he advanced money to these fishermen
who were interested for the purchase of boats and gear; and he
provided them with rent-free cottages with a ground-patch on
which they could grow potatoes: for built roads between the
village of Tarbert and the two jetties he made there, and he
erected a schoolhouse and an inn. But all this hard work to put
Harris on some realistic economic basis came to little. The native
population were slow to appreciate the potential income lying
about them.

The potential of the sea was of course eventually realised, particularly where the fishing grounds were favourable, Stornoway

SOCIAL LIFE

an enterprising radio firm in Stornoway; in customers receive
both BBC and Grampian Television programmes.

Some youth organisations are represented on the island. The
first troop of Boy Scouts was connected with the Stornoway
YMCA and was founded by forty boys in 1921. Founded (in
1912) on the island's close association with the sea was the Boys'
Brigade (Naval), later to become the Stornoway Naval Corps and
the Stornoway Boys' Naval Brigade. Its objects were to provide
instruction in drilling, signalling, seamanship and first aid; and to
foster a spirit of manliness and comradeship among its members.
The founder was Canon H. Anderson Meaden, of the Episcopal
Church in Stornoway (St Peter's). During the first war the boys
acted as signalmen at the Stornoway Battery.

But the provision of some organised recreational facilities for
young people on the island has long been a burning question. After
the first world war, the Rector of the Nicolson Institute, Stornoway, proposed that village halls be built for village education and
recreation. This scheme was never fully realised—except at Sandwick, just outside Stornoway—mainly because of the strength of
institutional opposition. This attitude has been breaking down,
however, and it is now generally realised that the wealth of any
community is based on its youth. Most of the efforts to set about
activities for young people began after the second war; but work
was hard and challenging with not a few failures on the way;
perseverance was seen to the extent that there is now a 18-year
youth leader. Most of the cultural and recreational activities
are to be found in Stornoway; with a full range of interests. Formerly non-sectarian classes during the winter are also widely
attended for a variety of subjects.

In 1965, an excellent Youth Hostel was established at Stockinish, Harris, with the help of the Inverness-shire Education
Department. In its first season it recorded between 600 and 700
visitors (1,070 bed-nights). Also involved in the establishment of
the hostel was the Harris Society of Social Service; practical help
was given by the 2nd Stornoway Boy Scouts, who made a wall
map, cleared up grounds and shifted furniture. A group of English
enthusiasts have in previous years arranged a hotel at Kleagglabe,
Harris (see Chapter 9), which provides for some fifty to

THE PEOPLE

eighty visitors each year, but there is nothing similar in Lewis.
Hostellers who visit Stornoway can do little more than march
through the town to the mail-boat, or else return to Harris by the
land bus.

As might be expected, the reading tradition is strong, stemming from a natural desire to learn and from the fact that the
ceilidh could only partly satisfy the need for mental stimulation,
not to mention the need to alleviate loneliness. A century ago
books were to be found in many island homes: the family
Bible, often a massive volume clad in hairy calfskin, *Turas e
Chaisdeadh (Pilgrim's Progress)* and *Gras ann Fuilteas* (Bunyan's
Grace Abounding). As horizons became wider a public library
was set up in Stornoway in 1907 (see Chapter 8); a library was in
fact established there earlier, before 1897, but it was not a free
one. In round figures, the 15,600 people of Inverness-shire
(Lewis excluding Stornoway) borrow some 70,000 books annually,
though of course the actual readership figures are higher, books
borrowed being passed round the family and exchanged with
others until the 'mobile' calls again. The mobile library service
was established by the Ross & Cromarty County Council in 1955
for rural villages in thirty-one school districts.

ISLAND EMIGRANTS

For all that the island is a tight-knit community, paradoxically it
breeds many men and women whose dominant urge is to spread out
within the confines of its own shores, but at the ends of far
horizons. This is typical of most Highland areas: none who leave
them make a mark on other societies often greatly exceeding the
size of the community they left behind. Many 'great' people are
also directly descended from a crofting ancestry; minds and spirits
bred in the Highlands and Islands have potential for development
not always apparent on native soil but sometimes fully realised in
alien surroundings and conditions.

Harris and Lewis have contributed their share, and still do, to
the general weal of skill, ability and intellect in all fields of human
endeavour. For centuries, the export of brains was normal. Partly
fully the best known is Sir Alexander MacKenzie, who discovered

SEA ROUTES

trappings of nineteenth-century civilisation, however, they grew to depend on items brought by sea. Imported food, clothing, wood, metal domestic utensils and the like were slowly assimilated as indispensable everyday articles. But there was relatively little export in return; then as now, any transport operator struggled with the fact that traffic was one-way and the freight charges must pay for the double voyage. Though the fishing industry and later the Harris Tweed industry were, around the turn of the century, to do much to determine and stabilise shipping developments, both passenger and cargo services were always facing loss rather than profit.

On the social side of the picture, the regular call of ships to the island, to Stornoway in particular, was a welcome, quickening sign that the island was significant in some way to the outside world. The ships brought visitors who made the island, and the Hebrides in general, better known to other prospective travellers. The exposure of the island and its folk to the gaze of the mainland led to a wider knowledge and understanding which without doubt brought improvements in social welfare and a basis for economic development. When many islanders found it necessary to go to Glasgow and the south for work, the ships of the Minch served as a firm link with home, to which they returned whenever they could. This feeling for home is still manifest today in the Lewismen in Canada who charter an aircraft to Prestwick each year so that they can holiday on the island. Since 1900 or so, passenger traffic has been two-way: emigrants, migrants, visitors and business travellers. When the fishing industry was in its heyday, the ships carried hundreds of fisherfolk across the Minch to ports as far south as Great Yarmouth to 'follow the herring' round the shores of Britain and back to the Minch again. Traffic today is still considerable, with the air-link with the island being used to its capacity.

In a community where Sabbath observance is an integral strand of religious belief, ministers have on occasions tried to preserve the Mosaic sanctity of the Sabbath Day by restricting the movement of ships in Stornoway harbour. In deference to local feeling the Stornoway steamer has always docked for twenty-four hours over Sunday, to leave port for Kyle just after midnight.

COMMUNICATIONS

This is only relaxed if emergency sailings are necessary. During the second world war attempts were made by Free Church ministers to stop the movement of ships in Stornoway harbour, but needless to say the war effort took precedence.

THE SHIPS

When Sir James Matheson bought Lewis in 1844, sea communications were still erratic: a mailboat or packet was running thrice weekly between Stornoway and Poolewe on Scotland's west coast. Sir James decided that a craft based on Stornoway would serve more efficiently both for general trade and for island-to-mainland transport, and he provided a regular steamer service. As this craft, the *Mary Jane*, was to carry mails, Sir James thought the Post Office should promote the service, and he struggled with that department for some years, eventually being promised a subsidy of £1,300. Though the scheme was to cost far more and had won no other financial support, the service began in 1846, Sir James being surety for the whole concern. He lost some £17,000. Another of his ships was the PS *Ondine*, which carried mails between Ullapool and Stornoway during the 1870s and '80s.

Quite apart from the Matheson ventures, things had been stirring in the south; the sea communications of the West Highlands and Islands were about to be commercially developed. One of the first ships on a regular run between Stornoway and the south was the *Ben Nevis*, a small wooden paddle vessel later to be wrecked south of Campbeltown in 1831 while homeward bound from Stornoway. G. & J. Burns was one of the main companies operating the early West Highland trade, managing to survive the vagaries of fortune until 1851, when its interests were passed to David Hutcheson, its chief clerk, on the condition that the Burns's nephew, David MacBrayne, became one of the partners. This was the beginning of the company so well known today, Messrs David MacBrayne Ltd. The new company started off with a building programme and gave birth to a long line of ships, many of whose names were to become bywords in the Western Isles.

The PS *Clansman* was the first. Her route was the strenuous one of Glasgow, Oban, Skye and Stornoway. Alexander Smith's

796 may need just one more dry day to finish his harvest. If the
241 next day is the Sabbath, his one dry day may be two or three weeks away and the hay a sodden heap. Nor did the Sgiathanach, or any newcomer with a croft, change during the war despite all the pleas of the government for full agricultural pro-
796 duction. This is the one time that the Older Order Amish slogan "And be not conformed to this world" fully applies to the island. Circumspect behavior on this day functions to remind the people of all the negations and all the sanctions which religion has bestowed on the culture.

178 As in the case of Communions, there has been a gradual
796 lessening of the importance of Sabbitarianism, especially since the return of many young men and women from the war.
[369] Again, the rather spontaneous relaxation of the rules is most common in Portree. It does not have the encouragement of the ministers of any church nor the elders of any church,
[226] except the Church of Scotland. Thirty or forty years ago the ministers and the lay kirk officers had enough influence to stop the running of trains throughout the western Highlands, shipping in the Western Isles, and the Kyle-Kyleakin ferry
[486] on the Sabbath. Public transportation is still at a stand-
[204] still on the first day of the week, but the Sunday papers appear in Portree after the evening services, despite all the efforts of the ministers. They come by car from Inverness, by row boat across the strait, and by car to the village.

178 Before the war no one in Portree would let their
796 children out of the house, except to go to church with their

ECOLOGY AND PHYSICAL ENVIRONMENT

THE CROFTING TOWNSHIP

361 The crofting township is not quite akin to the English or Lowland village. Primarily it is a collection of dwellings of families who, as social units, gain their subsistence from the land surrounding the houses. The smallest number for a township is four family units. A functional unit of four men was the minimum
476 necessary for a boat crew, or for the teamwork necessary to cultivate land; co-operation was essential if all four families were to survive. And from this grew the same spirit of communal work which in Lewis is seen at its best in the efforts to reclaim peat bog and turn it into fertile grassland.

361 Hebridean townships come close to being the nearest approach
[565] to a classless society. The shape of a township is largely dictated by the nature of the surrounding land. The shape of most of those in Harris and in Lewis is either scattered or linear (houses disposed in line at varying distances from each other), with little natural
[491] cover, either plantation or scrub. Often the main road runs through the township; some have begun to develop lateral roads, to give, from the air, the appearance of planning on a grid system.
244 Where gardens are cultivated, the produce tends to be a summer vegetable supply for the household, little if any finding its way to
372 Stornoway shops for sale. Peat is the usual fuel, though in townships near to the centres of Tarbert and Stornoway coal is burned; the cost of freight, however, makes it expensive.

471 Most of the townships are owned by commercial companies; individual lairds own some five dozen; the remainder belong to public bodies and trusts. The actual distribution of ownership of land on the island is as follows. Harris is virtually owned by individual lairds; a small percentage is owned by commercial companies. The Lochs region of Lewis has a mixed ownership: commercial companies, lairds, and public trust, the former being the largest. Stornoway parish is wholly owned by public trust.

COMMUNICATIONS

509 There were, of course, other types of flights before 1948. In
*175 1937, Captain Fresson took the first sick person off the island on
[143] charter—the beginning of the air-ambulance service so valuable
[205] to the islanders. During World War II, certain RAF mails were flown between Glasgow and Stornoway, on which there were first covers (December 1943, Glasgow/Stornoway; December 1943, Stornoway/Glasgow; and January 1944, Glasgow/Stornoway). The present air services are supplied by BEA and Loganair Ltd. The BEA plane route is Glasgow/Benbecula/Inverness and return. Loganair offer a service Glasgow/Benbecula/Stornoway and return. In recent years this small firm has built up a most valuable inter-island air link.

OVERLAND ROUTES

484 The history of overland communications in the island is a short
*175 one, though it does, like American history, have many characteristic highlights. In early times getting from one place to another
[487] was simply a matter of following well-worn tracks across the moorland, skirting lochsides and marshy lands and just taking the shortest distance possible between starting point and destination.
[499] Considering the length and breadth of the island, it is surprising that it was not until Sir James Matheson's appearance in Lewis that road-making was undertaken with any determination. This activity stemmed largely from the desire to get something in return for the outlay involved in keeping literal death from starvation clear of the doors of the island folk.

• 491 The report of the Rev James Headrick (prepared for Lord Sea-
499 forth in 1800 and published about 1820) indicated that the pro-
*175 vision of roads would be of great benefit to the island. A footnote in the report (of probable date 1816) urges assistance from Parliament or the Board of Fisheries to complete the road from Stornoway to Loch Roag, which had been begun by Lord Seaforth

Fourteen employees were directly concerned, with another six in the services sector.

The potential of the tourist industry is only beginning to be tapped. MacBrayne's drive-on drive-off car ferry, with a capacity of 50 cars and 600 passengers, makes two or three trips a day between Uig in Skye and Tarbert, the journey taking less than two hours. The mainstays of tourist accommodation in Harris are the Tarbert and Rodel Hotels, both well appointed and owning fishing rights for salmon and trout. Sea fishing is another tourist attraction. Crofters participate in the holiday trade by offering full board or bed and breakfast, caravans, caravan sites or vacant lets.

An interesting tourist venture has been started at Rhenigidale. A rough, stony track, one of the most tortuous and exciting in Britain, takes its leave from the main road over a ridge. It twists and turns in and out of gullies, over cliffsides and across the steep heather-clad slopes of the Toddum, a dramatic little hill of 1,730 ft which protects Rhenigidale village from the Atlantic gales. The seven-mile track is the only marked route, though crofters take a shorter way to the north over pathless bogs; the local postman makes a round of about 60 foot miles in the week, walking this track and on to Tarbert three times in all weathers. The village relies on its sheltered harbour with a good natural rock pier: most communication is by water, all food and fuel coming that way. In past times every household owned a boat for lobster and shell fishing to supplement both diet and finances. Today the interest in fishing has declined, as has the population. But in 1946 Mr Herbert Gatliff paid his first visit to Harris, discovered what the island had to offer, and started a campaign to convince hostelling interests of the need to make some investment in the Western Isles. A croft house in Rhenigidale was in 1961 equipped as a hostel, and under what is now the Gatliff Trust it is maintained for hardy trekkers, the Scottish Youth Hostels Association making a grant for running costs. Many visitors have found that the place offers a degree of happiness corresponding with its remoteness from civilisation.

As yet the tourist trade is almost entirely restricted to visiting relations but many houses offer suitable accommodation for people who would appreciate quiet holidays in these very beautiful surroundings. The distance from Stornoway, the difficulty of obtaining varied food supplies - and the weather - were cited as disadvantages! Passengers on a weekly coach tour from Stornoway are supplied with meals at an Ardroil house which has good access to the beach but otherwise the crofters show little interest in the possibilities of tourism.

In common with other crofting townships, the greatest problem here is that of an ageing population because the younger people seek employment outside their township. The diagrams illustrate the age-heavy structure of the permanent resident group and also the numbers of the insurable population periodically or permanently away. The lack of suitable work for young women particularly, is also shown. The ages of the tenants also illustrate this problem. Of the thirty-seven tenants here, twenty or 54% are over sixty-five. Serious, too, is the loss by emigration of people between fifteen and sixty-five. Of the total 'working population', 35% have left this region since 1939. The corresponding figure for Crowlista alone, the older settlement with smaller crofts, is as high as 42%.

We found in this part of Uig some crofts efficiently and energetically worked by young tenants, and if reasonable stock prices are obtained the larger crofts can be worked profitably. However no croft will fully support a family; ancillary employment is always sought by crofters with growing families yet many crofts are carrying less stock than they might because some tenants are not interested in, or able for, agriculture. The croft is increasingly thought of as a home, as part-time employment - often for older members of the family - and as a place for retirement.

It is easy to list schemes for improvement and change:- dairying to supply Stornoway with milk, poultry and pig keeping on a commercial scale, cultivation under glass, the tourist industry, forestry on a small scale, lobster and crab fishing, etc. Such schemes would require capital not available in the townships, careful planning, and tactful administration by people with real knowledge of this area and its people. Meanwhile even the potential production of the crofts is by no means realised.

CHAPTER SIX

AIRD

by

Madge Phillips.

The little township of Aird is an isolated and old-established crofting settlement along the western side of the steep and narrow valley of the Amhuinn Gil na h-Airde three miles north of Crowlista. After leaving Loch Meacheit, the river flows northward through a gorge (at the mouth of which are the ruins of the old corn-mill), then across a narrow flood-plain into the rocky bay of Camus na h-Airde. The crofts, roughly fan-shaped in arrangement and varying in size from 3½ to 7 acres, each originally included a narrow strip of the flood-plain, stretching across from just beyond the right bank of the river, up the steep, rocky slope above the left bank and widening out over the more gently slopes between the 100 ft. and 200 ft. contours. A number of the crofts were subsequently enlarged, gaining extra land on the right bank of the stream, whilst others received additional ground to the north or south.

1. [See figures 12 (facing p.34) and 17 (facing p.38)--Analyst]

(Lemreway) (Orinsay)

The West Highland Survey Township Card[1] describes Lemreway as "predominantly a fishing township". The remains of an old curing station are visible today and until 1947 there were twelve boats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats and the lack of a landing stage led to the decline of the industry in this township. Today there is one fishing boat which lands its catch in Stornoway: working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with those for Orinsay. Lemreway's resident population of just over 70 males and 70 females is large considering that there are six unoccupied crofts. Eleven of the crofts have more than one house and the cottar population forms over a third of the total residents. More than two-thirds of this resident population is in the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other crofting townships in Park.

Fourteen of these men are full-time croft workers, while nine others find work in ancillary occupations such as weaving and fishing. A further eight supplement their croft work with regular employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just over thirty people work away from the township permanently, fourteen in the Merchant Navy and nine girls in domestic service, while a further nine engage in seasonal work.

Emigration from the township has continued steadily with forty people leaving since 1939. Nevertheless, Lemreway has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions generally are good. Every house has electricity, but, with four exceptions, water has to be carried from springs and wells. Most of the present houses were constructed in the 1930s and they are usually near to the road. Ruins of the old houses remain, some being used as byres, and these were built either along the shore or up the slope in the shelter of the hills, where the house was near the sheep, the peat and the springs. Today supplies of food, peat and even seaweed are brought by road.

Mention must be made of the possibilities of the tourist trade in Lemreway with its most attractive situation and reasonable road connections. An approach has been made to the Scottish Youth Hostels Association and while hostellers could not greatly increase the income of the resident they would stimulate interest in the area. Accommodation for summer visitors, other than relatives of the crofters, is difficult to find but it seems that at least three houses could be used.

It is possible to be optimistic about the future of Lemreway, as at the moment considerable enterprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling, is an example. It is to be hired out and could be put to good use in some parts, especially on the outend. The attempt to improve the common pasture and the new extensions to neatly painted houses all reflect a combined effort to improve conditions. The old economy of crofter-fisherman is being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the contemporary employment combinations.

The pessimism and apathy noticed in many crofters is to be found in Lemreway but above this is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

Orinsay is a small crofting township clustered, in the form of a horseshoe, around the head of a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards of the shore on a narrow strip of level land, while the crofts extend from the shore on to the moor

1. The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 247.

hinterland with the outside world, Portree is a center for tourists during the summer. Due to the people's dependence on tourism and also the presence of newcomers, the villagers participate in a number of social activities which are not tolerated elsewhere on the island because of religious asceticism.

Glendale and Kilmuir are crofting communities, each with a population of about 300. All, except the ministers and school teachers, are dependent on the breeding of cattle and sheep and the growing of a limited amount of grain, potatoes and hay for all or a large part of their livelihood. All are bilingual, speaking Gaelic and English. Neither community has a village nucleus, but both have an economic focus. Glendale has a cooperative farm, and Kilmuir has a drained loch which has been divided among the small farmers. The significant differences between them are three. The Glendale people are land owners. In this respect they are rather unique in the Highlands. The Kilmuir residents, like most Highlanders, rent their crofts. The second difference is religious. Glendale is religiously homogeneous while Kilmuir includes church-goers of three Presbyterian sects. Finally, no formal social activities other than an annual meeting of the share-holders in the farm is allowed in Glendale, but Kilmuir has a club organization for the men who gather for lectures and discussions of economic problems.

division of labor. During the summer, she will milk the cows, and in the winter she will see that they are fed. If there is to be a harvest in the autumn, she will care for the crops.

Some women, in particular the older ones, plough with the caschrom, the foot plough. Other women use a small power driven plough or contract with the Department of Agriculture to have the ploughing done. The Department will also provide the men and machinery to harrow, cultivate, spread lime and manure, mow hay, cut and bind oats, dig potatoes, and thresh grain. By utilizing these services, if they can be afforded, the small crofter can free himself or, at least his wife, from many arduous tasks. The need for cooperation of the family and neighbors is thereby reduced. Although traditional mutual aid is being replaced by cash payment for labor, it is not the labor of a landless working class which commercialization often creates, but rather state provided services. Significantly, most Department employees are newcomers. The Skye man who works for the Department is a better worker away from the island. Since few are able to pay for these services, the wife digs the potatoes, and some women use the scythe to reap hay and oats. The scythe, it will be remembered is really a man's tool. Frequently, the break with tradition is avoided by the return of a son from the mainland or the sea. Running the household and working the croft is not all some women do. They also take in summer visitors, by the day or week, and provide teas for travellers.

In summary, it may be said that crofting is anything but an easy life with ample rewards. We have seen how meager the

mainland villages and crofting areas. Ministers from neighboring and even distant churches used to come to take part in conducting the services. There was no church to hold so many people, so the Communion was celebrated outside. Then, of course, the population was much larger and the majority belonged to one church, the Free Church.

The Communion Season is still marked by large gatherings of people at each church in turn. The "elect" from the neighboring churches and the ministers from churches near and far exchange visits. The adherents also participate in the celebration of the Lord's Supper. From Thursday until Monday the homes of the people in the vicinity are open to their relatives and friends who have come to partake of the sacrament or who find the highly emotional atmosphere and gregariousness stimulating. Some, especially the "elect" stay for the five days. Others will spend one or more nights. During the day and in the evening, whenever they are not attending religious services, they visit their "people" and "friends" to renew ties which in many cases have been allowed to languish since the last Communion. Thus, we find religion sanctioning the time-honored custom of Highland hospitality. It is interesting to note that many a woman who depends on the tourist trade for a good share of her income will not accept paying guests at this time. The local people have a further share in extending hospitality to their visitors. All who are able send food to the manse (parsonage) to lessen the burden on the minister who extends hospitality to the visiting clergy and as many of the laity as he can. This

ents and to Sabbath school, nor would they allow children 178
play games in the home. Today the children of the Church 796
Scotland people are allowed to go for a walk, read, or 857
y games. Tourists, frequently, if not always, intolerant 484
the strict Sabbath, have no doubt contributed to this 178
axation of taboos. Although a further development of the 796
rist industry would be advantageous economically, tourists
a threat not only to the Sabbath but also to the whole
igious complex. They set examples which the youth are
too ready to emulate. Before the war every hotel on 485
Island, including all in Portree, and every boarding 796
se posted notices requesting visitors to refrain from
ng their cars for touring on the Sabbath. In many of the
st homes the request was the equivalent of a warning of
val. Today the signs are gone. Still not content, the
rist agencies in England and the Lowlands continue to make
e remarks in their literature, suggesting "a little more
rance is needed in certain quarters." The youth and some 178
ts of Portree now have begun to go off for a drive around 796
island. One reason why the Sabbath is still strong in 484
uir and Glendale is that tourists are not accepted in
er district.

Strict Sabbath observance distinguishes three broad 796

4 COMMUNICATIONS

FROM the earliest times, the provision of communications in one form or another has been a matter full of incident and high colour. Gaelic folk-song contains many references to the hazards of crossing the impatient waters of the Minch. One such, a waulking song still known today, commemorates the death of Iain Garbh Mac Gille Chaluim, of Raasay in Skye, who was drowned in April 1617 on his way home from visiting the Earl of Seaforth in Lewis; it is said that he was drowned through the workings of his own 'muime', or foster-mother, who employed several famous witches to raise the tempest in which his ship foundered.

For well over a century the subject of adequate communications has aroused continuous argument. The strength of any island community lies in its ability to live within itself, while accepting the periodic injection of certain external items necessary for living or for work. A Londoner once expressed amazement at the isolation of Scarp, in West Harris, commenting that in Scarp they would not know what was happening in London. The indisputable rejoinder was 'Nor do they know in London what we would be doing in Scarp.' However, to a large island community, with a certain degree of economic significance, communications are the basic lifeline.

SEA ROUTES

When in the early 1800s formal sea communications were being established between the island and ports on the west coast of Scotland, down as far as the Clyde, most of the islanders were of course little affected. Except for the professional classes (merchants, ministers and the like), they had little use for the sea links provided for them. Their economy was not yet a cash economy, and travel was thus a luxury they could not afford. As the nature of local life began to change with the infiltration of some of the

There were, of course, other types of flights before 1948. In 1937, Captain Fresson took the first sick person off the island on charter—the beginning of the air-ambulance service so valuable to the islanders. During World War II, certain RAF mails were flown between Glasgow and Stornoway, on which there were first covers (December 1943, Glasgow/Stornoway; December 1943, Stornoway/Glasgow; and January 1944, Glasgow/Stornoway). The present air services are supplied by BEA and Loganair Ltd. The BEA plane route is Glasgow/Benbecula/Inverness and return. Loganair offer a service Glasgow/Benbecula/Stornoway and return. In recent years this small firm has built up a most valuable inter-island air link.

OVERLAND ROUTES

The history of overland communications in the island is a short one, though it does, like American history, have many characteristic highlights. In early times getting from one place to another was simply a matter of following well-worn tracks across the moorland, skirting lochsides and marshy lands and just taking the shortest distance possible between starting point and destination. Considering the length and breadth of the island, it is surprising that it was not until Sir James Matheson's appearance in Lewis that road-making was undertaken with any determination. This activity stemmed largely from the desire to get something in return for the outlay involved in keeping literal death from starvation clear of the doors of the island folk.

The report of the Rev James Headrick (prepared for Lord Seaforth in 1800 and published about 1820) indicated that the provision of roads would be of great benefit to the island. A footnote in the report (of probable date 1816) urges assistance from Parliament or the Board of Fisheries to complete the road from Stornoway to Loch Roag, which had been begun by Lord Seaforth. There is a bitter complaint that though the Seaforth property bears a large share in the county assessment, 'not a penny of public money has ever been laid out in Lewis'. Another footnote records that the road from Stornoway to Aignish in the east was made in 1815. No large undertakings followed Mr Headrick's

(2,620 ft); grouped around this are the lesser peaks staring stark and treeless to the skies. At the feet of these hills are the small villages straggled along the shores of West Loch Tarbert. Much of this area is owned by the proprietors of Amhuinnsuidh Castle, a magnificent structure built by the Earl of Dunmore in the last century; the hills lying north of it are rich in red deer. The road past the castle trundles on until it peters out at the far-east village of Hushinish, beside a glorious scimitar-like curve of silver sand. Beyond Hushinish is the Island of Scarp.

The road along the shores of East Loch Tarbert ends at the village of Kyles Scalpay which overlooks Scalpay island. The Bays of Harris hold in their crevices the scattered groups of houses here and there, where an inlet of the rocky coast affords some anchorage and where a patch of ground is suitable for cultivation. Tortuous, winding footpaths have been gradually replaced by narrow roads connecting the townships. Lack of sufficient remunerative employment has led to considerable depopulation. Fifty years ago the population of the area was just over 5,400; it is now about 2,900.

The south of Harris is better known for its association with Lord Leverhulme. Obbe, later Leverburgh, became the centre of his schemes. He built a large pier, huge kippering sheds, houses for the workers, roads and lighthouses, and blasted away underwater rocks which hindered free navigation. The bulk of this work was complete in 1924, but when he died (in 1925) his successors, in the cold light of economics, decided to close down the embryo industry and realise its assets. The harbour works had cost £250,000; they were sold for £5,000 to a demolition company. Leverhulme's memorials are still to be seen. The west coast of Harris is now becoming known for the long stretches of shell sand and the green machar-land beside it, a true delight for the tourist seeking isolation.

Tarbert is the central village in Harris, with a population of about 400. It is a thriving community, nestling at the foot of Beinn an Teanga and at the head of the sheltered anchorage of East Loch Tarbert—sheltered from the prevailing south-westerly winds and from the Atlantic storms. The car ferries give direct contact with the Scottish mainland, via Skye, and Tarbert also

316 Fourteen employees were directly concerned, with another six in 464 the services sector.

The potential of the tourist industry is only beginning to be 484 tapped. MacBrayne's drive-on drive-off car ferry, with a capacity [505] of 50 cars and 600 passengers, makes two or three trips a day between Uig in Skye and Tarbert, the journey taking less than two hours. The mainstays of tourist accommodation in Harris are 484 the Tarbert and Rodel Hotels, both well appointed and owning 485 fishing rights for salmon and trout. Sea fishing is another tourist 529 attraction. Crofters participate in the holiday trade by offering [226] full board or bed and breakfast, caravans, caravan sites or vacant lets.

An interesting tourist venture has been started at Rhenigidale. 484 A rough, stony track, one of the most tortuous and exciting in 487 Britain, takes its leave from the main road over a ridge. It twists 529 and turns in and out of gullies, over cliffsides and across the steep heather-clad slopes of the Toddum, a dramatic little hill of 1,730 ft which protects Rhenigidale village from the Atlantic gales. The [205] seven-mile track is the only marked route, though crofters take a shorter way to the north over pathless bogs; the local postman makes a round of about 60 foot miles in the week, walking this track and on to Tarbert three times in all weathers. The village 504 relies on its sheltered harbour with a good natural rock pier: 361 most communication is by water, all food and fuel coming that 505 way. In past times every household owned a boat for lobster and 501 shell fishing to supplement both diet and finances. Today the 226 interest in fishing has declined, as has the population. But in 1946 485 Mr Herbert Gatliff paid his first visit to Harris, discovered what the island had to offer, and started a campaign to convince hostelling interests of the need to make some investment in the Western Isles. A croft house in Rhenigidale was in 1961 equipped as a hostel, and under what is now the Gatliff Trust it is maintained for hardy trekkers, the Scottish Youth Hostels Association making a grant for running costs. Many visitors have found that the place offers a degree of happiness corresponding with its remoteness from civilisation.

361 Many of the original houses are ruined or used as byres. Figure 14 shows that new
491 houses have been built near the sites of the old ones but sometimes nearer the road - all
487 but four houses have easy access to the road. Crowlista is linked to the main road by
492 two miles of rough gravel side-road, and by a footpath and ford via Timsgarry. Vans call
205 but there is no Post Office, store nor bus service. At present water supplies are poor -
366 two wells only are in use.
494
312

Carnish is served by a short unmetalled road and all houses have good access to this. Water supply is good; water may be stored on the high part of the crofts and piped into the houses. The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile away. This 'main road' from western Uig to Stornoway runs through Ardroil and all
[366] except one of the houses not near to it have good drives suitable for lorries. Ardroil has
205 a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly
453 and the travelling bank fortnightly. The thrice-weekly bus service to Stornoway (return
[494] fare almost £1) ceased in 1960 because of competition from privately owned vans and cars.

241 The cultivated land is in strips usually large enough for horse or tractor work; the
[231] smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil, and
[467] Carnish have one each and Crowlista none. Crofters hire these horses or tractors from Brenish or Enaclete. Oats and potatoes are the only crops grown in quantity, small patches of turnips are found and most crofters grow root vegetables. Kale was seen growing on one Ardroil croft; this was an experiment and seemed to be very successful. Bere and rye are no longer grown. Grass mixtures are sown in order to qualify for cultivation grants. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years age was said still to be giving very good hay, but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour available. Crofters find this difficult to estimate as well, as often small irregularly shaped pieces are cut, and the figures, therefore, may not be accurate. (Appendix A).

One excellent garden showed that a rich variety of vegetables, fruit and flowers can be grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or interest.

242 Lime, dung and artificial manure are widely used, though on some Crowlista crofts
134 the compound fertilisers were in use for the first time in 1959. Shell sand is used on the
324 crofts which have peaty soil. Although it is agreed that seaweed and dung are the ideal fertilisers for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.

231 Each of the thirty-five operative units which carry any stock at all has a cow for domestic milk supply and manure. If the family is large or many visiting relations stay on the croft during the summer the calf has to be sold early; otherwise it will be reared until the cattle sales in September or May. Only eight crofters had two cows; fifty years ago four were commonly kept. Only thirteen of the units had young cattle other than calves. One crofter was rearing a kid for milk.

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

233 It was sometimes difficult to obtain factual information about sheep and it is difficult to generalise. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to two

Warehouse buildings 347

of Lord Seaforth's conduct in this matter. They alleged that he 228
'draiv in hither an number of strangers who daylie resorts to and 175*
fra Holland to the Lewes and continent next adjacent (the Ross 648
mainland presumably) and has caused them be answered of all such commodities as these bounds affords, as nameli with fishes and beeves quhilkis with the hyde and tallow, with manie utheris commodities they transport to Holland.'

To satisfy the Royal Burghs, Seaforth had some of his Dutch friends sent away. But several Dutch families remained in Stornoway until the outbreak of hostilities between England and Holland in 1653.

In Harris, similar efforts were promoted by Captain Alexander 228
MacLeod, who in 1779 bought Harris, together with St Kilda, 175*
for £15,000 from the commissioners acting on behalf of General [425]
